It remains to prove (ii_2). Let $C \in \mathcal{C}^{\otimes}_{s,\langle n \rangle}$ and let $\beta : C \to D$ be a locally p-coCartesian morphism in $\mathcal{C}^{\otimes}$ covering the unique active map $\beta_0 : \langle n \rangle \to \langle 1 \rangle$. Choose a p_s-coCartesian morphism $\beta' : C \to C'$ in $\mathcal{C}^{\otimes}_s$ lying over β_0. Since $\mathcal{C}^{\otimes}$ is a Cartesian S-family of ∞-operads, the morphism β' is p-coCartesian. We can therefore factor β as a composition

$$C \xrightarrow{\beta'} C' \xrightarrow{\beta''} D,$$

where β'' is a morphism in $\mathcal{C}$. Since β is locally p-coCartesian and β' is p-coCartesian, the morphism β'' is also locally p-coCartesian. Since $F_1(\beta')$ is an equivalence (by (ii_0)), it will suffice to show that $F_1(\beta'')$ is locally q-coCartesian. We have a commutative diagram

$$\begin{array}{ccc} F(C',0) & \longrightarrow & F(C',1) \\ \downarrow{\scriptstyle f(\beta'')} & & \downarrow{\scriptstyle F_1(\beta'')} \\ F(D,0) & \longrightarrow & F(D,1). \end{array}$$

Since F satisfies (i), the horizontal maps in this diagram are equivalences. We are therefore reduced to proving that $f(\beta'')$ is locally q-coCartesian, which follows from (v). □

It follows from Proposition 6.3.1.12 that if $\mathcal{O}^{\otimes} \to S \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ is a Cartesian local S-family of ∞-operads which admits a Cartesian structure, then $\mathcal{O}^{\otimes}$ is determined up to equivalence by the underlying locally Cartesian fibration $\mathcal{O} \to S$. We next prove a converse: given a locally coCartesian fibration $\mathcal{O} \to S$ where each fiber $\mathcal{O}_s$ admits finite products, we construct a local S-family of ∞-operads $\mathcal{O}^{\otimes} \to S \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ and a Cartesian structure $\mathcal{O}^{\otimes} \to \mathcal{O}$. For this, we need a relative version of Construction 2.4.1.4.

Construction 6.3.1.10. Let $\Gamma^{\times}$ be the category introduced in Notation 2.4.1.2 (so that the objects of $\Gamma^{\times}$ are pairs $(\langle n \rangle, K)$, where $K \subseteq \langle n \rangle^{\circ}$. Let $p : \mathcal{C} \to S$ be a locally coCartesian fibration of simplicial sets. We define a simplicial set $\widetilde{\mathcal{C}}^{\times}$ equipped with a map $\widetilde{\mathcal{C}}^{\times} \to S \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ by the following universal property: for every map of simplicial sets $K \to \mathrm{N}(\mathcal{F}\mathrm{in}_*)$, we have an isomorphism

$$\mathrm{Fun}_{S \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)}(K, \widetilde{\mathcal{C}}^{\times}) \simeq \mathrm{Fun}_S(K \times_{\mathrm{N}(\mathcal{F}\mathrm{in}_*)} \mathrm{N}(\Gamma^{\times}), \mathcal{C}).$$

Note that for each $s \in S$, we have a canonical isomorphism $\widetilde{\mathcal{C}}^{\times} \times_S \{s\} \simeq \widetilde{\mathcal{C}}^{\times}_s$, where $\widetilde{\mathcal{C}}^{\times}_s$ is obtained by applying Construction 2.4.1.4 to the ∞-category $\mathcal{C}_s$. We let $\mathcal{C}^{\times}$ denote the full simplicial subset of $\widetilde{\mathcal{C}}^{\times}$ spanned by those vertices which belong to $\mathcal{C}^{\times}_s \subseteq \widetilde{\mathcal{C}}^{\times}_s$, for some vertex $s \in S$.

小红书号:3189205503 qq

Remark 6.3.1.11. Let $p : \mathcal{C} \to S$ be a locally coCartesian fibration of simplicial sets. We will identify vertices of $\widetilde{\mathcal{C}}^{\times}$ with triples $(\langle n \rangle, s, \lambda)$, where $\langle n \rangle$ is an object of $\mathrm{N}(\mathcal{F}\mathrm{in}_*)$, s is a vertex of S, and λ is a map from the nerve of the partially ordered set of subsets of $\langle n \rangle^\circ \simeq \{1, \ldots, n\}$ (ordered by reverse inclusion) to the ∞-category $\mathcal{C}_s$.

The fundamental properties of Construction 6.3.1.10 are summarized in the following result:

Proposition 6.3.1.12. *Let $p : \mathcal{C} \to S$ be a locally coCartesian fibration of simplicial sets. Then:*

(1) *The projection $\widetilde{q} : \widetilde{\mathcal{C}}^{\times} \to S \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ is a locally coCartesian fibration.*

(2) *Let $\overline{\alpha} : (\langle n \rangle, s, \lambda) \to (\langle n' \rangle, t, \lambda')$ be an edge of $\widetilde{\mathcal{C}}^{\times}$, so that $\overline{\alpha}$ determines a map $\alpha : \langle n \rangle \to \langle n' \rangle$ in $\mathcal{F}\mathrm{in}_*$ and an edge $e : s \to s'$ in S. Then $\overline{\alpha}$ is locally $\widetilde{q}$-coCartesian if and only if, for every $K \subseteq \langle n' \rangle^\circ$, the induced map $\lambda(\alpha^{-1}K) \to \lambda'(K)$ is locally p-coCartesian.*

(3) *Suppose that each of the ∞-categories $\mathcal{C}_s$ admits finite products. Then $q : \mathcal{C}^{\times} \to S \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ is a locally coCartesian fibration. Moreover, an edge $\overline{\alpha} : (\langle n \rangle, s, \lambda) \to (\langle n' \rangle, t, \lambda')$ is locally q-coCartesian if and only if, for every element $j \in \langle n' \rangle^\circ$, the induced map $\lambda(\alpha^{-1}\{j\}) \to \lambda'(\{j\})$ is locally p-coCartesian.*

(4) *Suppose that each of the ∞-categories $\mathcal{C}_s$ admits finite products. Then q exhibits $\mathcal{C}^{\times}$ as a corepresentable local S-family of ∞-operads.*

(5) *Suppose that each $\mathcal{C}_s$ admits finite products, and let $\pi : \mathcal{C}^{\times} \to \mathcal{C}$ be the map given by composition with the section $s : \mathrm{N}(\mathcal{F}\mathrm{in}_*) \to \mathrm{N}(\Gamma^{\times})$ defined in Remark 2.4.1.3 (given by $\langle n \rangle \mapsto (\langle n \rangle, \langle n \rangle^\circ)$). Then π is a Cartesian structure on $\mathcal{C}^{\times}$.*

Proof. The forgetful functor $\mathrm{N}(\Gamma^{\times}) \to \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ is a Cartesian fibration, and therefore a flat categorical fibration (Example B.3.11). It follows from Proposition B.3.14 that q is a categorical fibration. To prove that q is a locally coCartesian fibration, it will suffice to show that for every edge $\Delta^1 \to S$ the induced map $\Delta^1 \times_S \widetilde{\mathcal{C}}^{\times} \to \Delta^1 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ is a locally coCartesian fibration. We may therefore replace S by Δ^1 and thereby reduce to the case where p is a coCartesian fibration. Assertions (1) and (2) now follow from Corollary HTT.3.2.2.13 .

We now prove (3). Fix a vertex $(s, \langle n \rangle)$ of $S \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$, so that we can identify objects of $\widetilde{\mathcal{C}}^{\times}_{s,\langle n \rangle}$ with functors $\mathrm{N}(\mathbf{P}(\langle n \rangle^\circ)) \to \mathcal{C}_s$. The full subcategory $\mathcal{C}^{\times}_{s,\langle n \rangle}$ is spanned by those functors which are right Kan extensions of their restriction to the full subcategory $\mathrm{N}(\mathbf{P}_1(\langle n \rangle^\circ)) \subseteq \mathrm{N}(\mathbf{P}(\langle n \rangle^\circ))$, where $\mathbf{P}_1(\langle n \rangle^\circ)$ consists of subsets having cardinality 1. Using our assumption that $\mathcal{C}_s$ admits finite products, we deduce that the inclusion $\mathcal{C}^{\times}_{s,\langle n \rangle} \hookrightarrow \widetilde{\mathcal{C}}^{\times}_{s,\langle n \rangle}$ admits a left adjoint $L_{s,\langle n \rangle}$. Moreover, a morphism $\lambda \to \lambda'$ in $\widetilde{\mathcal{C}}^{\times}_{s,\langle n \rangle}$ is an $L_{s,\langle n \rangle}$ equivalence if and only if, for every element $j \in \langle n \rangle^\circ$, the induced map $\lambda(\{j\}) \to \lambda'(\{j\})$ is an equivalence.

We now argue that q is a locally coCartesian fibration. Suppose we are given a vertex $(\langle n \rangle, s, \lambda)$ in $\mathcal{C}^{\otimes}$ and an edge $\alpha : (\langle n \rangle, s) \to (\langle n' \rangle, t)$ in $\mathrm{N}(\mathcal{F}\mathrm{in}_*) \times S$. Let $\overline{\alpha}' : (\langle n \rangle, s, \lambda) \to (\langle n' \rangle, t, \lambda')$ be a

小红书 小红书号:3189205503 qq

locally $\widetilde{q}$-coCartesian morphism in $\widetilde{\mathcal{C}}^{\otimes}$ lifting α. Let $\overline{\alpha}'' : \lambda' \to \lambda''$ be a morphism in the ∞-category $\widetilde{\mathcal{C}}^{\times}_{t,\langle n' \rangle}$ which exhibits λ'' as a $\mathcal{C}^{\times}_{t,\langle n' \rangle}$-localization of λ'. Since $\widetilde{q}$ is an inner fibration, we can choose a 2-simplex

$$\begin{array}{ccc} & (\langle n' \rangle, t, \lambda') & \\ {\scriptstyle \overline{\alpha}'} \nearrow & & \searrow {\scriptstyle \overline{\alpha}''} \\ (\langle n \rangle, s, \lambda) & \xrightarrow{\overline{\alpha}} & (\langle n' \rangle, t, \lambda'') \end{array}$$

lifting the degenerate 2-simplex

$$\begin{array}{ccc} & (\langle n' \rangle, t) & \\ {\scriptstyle \alpha} \nearrow & & \searrow {\scriptstyle \mathrm{id}} \\ (\langle n \rangle, s) & \xrightarrow{\alpha} & (\langle n' \rangle, t) \end{array}$$

of $\mathrm{N}(\mathcal{F}\mathrm{in}_*) \times S$. We note that $\overline{\alpha}$ is locally q-coCartesian. Moreover, condition (2) implies that for every subset $K \subseteq \langle n' \rangle^{\circ}$, $\overline{\alpha}'$ induces a locally p-coCartesian edge $\lambda(\alpha^{-1}K) \to \lambda'(K)$. Since $\overline{\alpha}'$ is an $L_{t,\langle n' \rangle}$-equivalence, it induces an equivalence $\lambda'(\{j\}) \to \lambda''(\{j\})$ for each $j \in \langle n' \rangle^{\circ}$. It follows by transitivity that $\lambda(\alpha^{-1}\{j\}) \to \lambda''(\{j\})$ is locally p-coCartesian for each $j \in \langle n' \rangle^{\circ}$. This proves the "only if" direction of the final assertion of (3). To prove the converse, suppose we are given an arbitrary edge of $\overline{\beta} : (\langle n \rangle, s, \lambda) \to (\langle n' \rangle, t, \mu)$ in $\mathcal{C}^{\times}$ which lifts α and induces locally p-coCartesian edges $\lambda(\alpha^{-1}\{j\}) \to \mu(\{j\})$ for each $j \in \langle n \rangle^{\circ}$. Since $\overline{\alpha}$ is locally q-coCartesian, we can choose a 2-simplex

$$\begin{array}{ccc} & (\langle n' \rangle, t, \lambda'') & \\ {\scriptstyle \overline{\alpha}} \nearrow & & \searrow {\scriptstyle \gamma} \\ (\langle n \rangle, s, \lambda) & \xrightarrow{\overline{\beta}} & (\langle n' \rangle, t, \mu) \end{array}$$

where γ is a morphism in $\mathcal{C}^{\times}_{t,\langle n' \rangle}$. Then γ induces an equivalence $\lambda''(\{j\}) \to \mu(\{j\})$ for each $j \in \langle n' \rangle^{\circ}$. It follows that γ is an equivalence, so that $\overline{\beta}$ is also locally q-coCartesian.

We now prove (4). We may assume without loss of generality that $S = \Delta^n$. We will show that it is a corepresentable local S-family of ∞-categories by verifying the hypotheses of Lemma 6.2.5.18. The third hypothesis is clear (it follows from Proposition 2.4.1.5 that $\mathcal{C}^{\times}_s \to \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ is a symmetric monoidal ∞-category for each vertex $s \in S$). We will check the first hypothesis; the proof of the second is similar. Suppose we are given a 2-simplex

$$\begin{array}{ccc} & (\langle m \rangle, s, \lambda') & \\ {\scriptstyle \alpha} \nearrow & & \searrow {\scriptstyle \beta} \\ (\langle m' \rangle, s, \lambda) & \xrightarrow{\gamma} & (\langle n \rangle, t, \lambda'') \end{array}$$

in $\mathcal{C}^{\times}$ where α is inert and β is locally q-coCartesian. Let $\gamma_0 : \langle m' \rangle \to \langle n \rangle$ be the image of γ in $\mathrm{N}(\mathcal{F}\mathrm{in}_*)$, and define α_0 and β_0 similarly. We wish to show that γ is locally q-coCartesian. Unwinding

小红书 小红书号:3189205503 qq

the definitions, we must show that for $j \in \langle m \rangle^\circ$, then the induced edge $\lambda(\gamma_0^{-1}\{j\}) \to \lambda''(\{j\})$ is locally p-coCartesian. Since β is locally q-coCartesian, the edge $\lambda'(\beta_0^{-1}\{j\}) \to \lambda''(\{j\})$ is locally p-coCartesian. It will therefore suffice to show that $\lambda(\gamma_0^{-1}\{j\}) \to \lambda'(\beta_0^{-1}\{j\})$ is an equivalence, which follows from the inertness of α.

To prove (5), we node that the first condition of Definition 6.3.1.7 follows from Proposition 2.4.1.5, and the second follows the description of the class of locally q-coCartesian morphisms given by (2) and (3). □

Notation 6.3.1.13. Let S be a simplicial set and let $p : \mathcal{C}^\otimes \to S \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ and $q : \mathcal{D}^\otimes \to S \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ be corepresentable local S-families of ∞-operads. We let $\mathrm{Fun}^\otimes_S(\mathcal{C}^\otimes, \mathcal{D}^\otimes)$ denote the full subcategory of $\mathrm{Fun}_{S \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)}(\mathcal{C}^\otimes, \mathcal{D}^\otimes)$ spanned by those maps F which carry locally p-coCartesian edges of $\mathcal{C}^\otimes$ to locally q-coCartesian edges of $\mathcal{D}^\otimes$.

Proposition 6.3.1.14. *Let $p : \mathcal{C}^\otimes \to S \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ be a corepresentable local S-family of ∞-operads, let $q : \mathcal{D} \to S$ be a locally coCartesian fibration, and assume that each of the ∞-categories $\mathcal{D}_s$ admits finite products. Let $\pi : \mathcal{D}^\times \to \mathcal{D}$ be the Cartesian structure of Proposition 2.4.1.5. Then composition with π induces a trivial Kan fibration*

$$\mathrm{Fun}^\otimes_S(\mathcal{C}^\otimes, \mathcal{D}^\times) \to \mathrm{Fun}^\times_S(\mathcal{C}^\otimes, \mathcal{D}),$$

where $\mathrm{Fun}^\times_S(\mathcal{C}^\otimes, \mathcal{D})$ is defined as in Proposition 6.3.1.9.

Proof. Arguing as in the proof of Proposition 6.3.1.9, we can reduce to the case where $S = \Delta^k$ is a simplex (and, in particular, an ∞-category). Unwinding the definitions, we can identify $\mathrm{Fun}^\otimes_S(\mathcal{C}^\otimes, \mathcal{D}^\times)$ with the full subcategory of $\mathrm{Fun}_S(\mathcal{C}^\otimes \times_{\mathrm{N}(\mathcal{F}\mathrm{in}_*)} \mathrm{N}(\Gamma^\times), \mathcal{D})$ spanned by those functors F which satisfy the following condition:

(1) For every vertex $s \in S$ and every object $C \in \mathcal{C}^\otimes_{s,\langle n \rangle}$ and every subset $J \subseteq \langle n \rangle^\circ$, the functor F induces an equivalence
$$F(C, J) \to \prod_{j \in J} F(C, \{j\})$$
in the ∞-category $\mathcal{D}_s$.

(2) For every locally p-coCartesian morphism $\alpha : C \to C'$ covering a map $\alpha_0 : \langle n \rangle \to \langle n' \rangle$ in $\mathcal{F}\mathrm{in}_*$, and every element $j \in \langle n' \rangle^\circ$, the induced map $F(C, \alpha^{-1}\{j\}) \to F(C', \{j\})$ is a locally q-coCartesian morphism of $\mathcal{D}$.

The functor $F' = \pi \circ F$ can be described by the formula $F'(C) = F(C, \langle n \rangle^\circ)$, for each $C \in \mathcal{C}^\otimes_{\langle n \rangle}$. In other words, F' can be identified with the restriction of F to the full subcategory of $\mathcal{C}' \subseteq \mathcal{C}^\otimes \times_{\mathrm{N}(\mathcal{F}\mathrm{in}_*)} \mathrm{N}(\Gamma^\times)$ spanned by objects of the form $(C, \langle n \rangle^\circ)$ (note that $\mathcal{C}'$ is canonically isomorphic to $\mathcal{C}^\otimes$).

小红书
小红书号:3189205503 qq

Let $X = (C, J)$ be an object of the fiber product $\mathcal{C}^{\otimes} \times_{\mathrm{N}(\mathcal{F}\mathrm{in}_*)} \mathrm{N}(\Gamma^{\times})$. Here $C \in \mathcal{C}^{\otimes}_{\langle n \rangle}$ and $J \subseteq \langle n \rangle^{\circ}$. We claim that the ∞-category $\mathcal{C}'_{X/}$ has an initial object. More precisely, if we choose an inert morphism $\overline{\alpha} : C \to C'$ covering the map $\alpha : \langle n \rangle \to J_*$ given by the formula

$$\alpha(j) = \begin{cases} j & \text{if } j \in J \\ * & \text{otherwise,} \end{cases}$$

then the induced map $\widetilde{\alpha} : (C, J) \to (C', J)$ is an initial object of $\mathcal{C}'_{X/}$. It follows that every functor $F' : \mathcal{C}' \to \mathcal{D}$ admits a right Kan extension to $\mathcal{C}^{\otimes} \times_{\mathrm{N}(\mathcal{F}\mathrm{in}_*)} \mathrm{N}(\Gamma^{\times})$, and that an arbitrary functor $F : \mathcal{C}^{\otimes} \times_{\mathrm{N}(\mathcal{F}\mathrm{in}_*)} \mathrm{N}(\Gamma^{\times}) \to \mathcal{D}$ is a right Kan extension of $F | \mathcal{C}'$ if and only if $F(\widetilde{\alpha})$ is an equivalence, for every $\widetilde{\alpha}$ defined as above.

Let $\mathcal{E}$ be the full subcategory of $\mathrm{Fun}(\mathcal{C}^{\otimes} \times_{\mathrm{N}(\mathcal{F}\mathrm{in}_*)} \mathrm{N}(\Gamma^{\times}), \mathcal{D})$ spanned by those functors F which satisfy the following conditions:

($1'$) The restriction $F' = F | \mathcal{C}'$ is a weak Cartesian structure on $\mathcal{C}' \simeq \mathcal{C}^{\otimes}$.

($2'$) The functor F is a right Kan extension of F'.

Using Proposition HTT.4.3.2.15 , we conclude that the restriction map $\mathcal{E} \to \mathrm{Fun}^{\times}_{S}(\mathcal{C}^{\otimes}, \mathcal{D})$ is a trivial fibration of simplicial sets. To prove that θ is a trivial Kan fibration, it will suffice to show that conditions (1) and (2) are equivalent to conditions ($1'$) and ($2'$).

Suppose first F is a functor satisfying conditions ($1'$) and ($2'$). We first verify condition (1). Let $C \in \mathcal{C}^{\otimes}_{s, \langle n \rangle}$, let $J \subseteq \langle n \rangle^{\circ}$. We wish to show that the canonical map $F(C, J) \to \prod_{j \in J} F(C, \{j\})$ is an equivalence in $\mathcal{D}_s$. Let $\widetilde{\alpha} : (C, J) \to (C', J)$ and $\{\widetilde{\alpha}_j : (C, \{j\}) \to (C'_j, \{j\})\}_{j \in J}$ be defined as above. We have a commutative diagram

$$\begin{array}{ccc} F(C, J) & \longrightarrow & \prod_{j \in J} F(C, \{j\}) \\ \downarrow & & \downarrow \\ F(C', J) & \longrightarrow & \prod_{j \in J} F(C'_j, \{j\}) \end{array}$$

in the ∞-category $\mathcal{D}_s$. Using condition ($2'$), we deduce that the vertical maps are equivalences. It will therefore suffice to show that the lower horizontal map is an equivalence, which follows immediately from ($1'$).

We now verify condition (2). Choose a locally p-coCartesian morphism $\widetilde{\beta} : C \to C'$ covering a map $\beta : \langle n \rangle \to \langle n' \rangle$ in $\mathcal{F}\mathrm{in}_*$ and let $j \in \langle n' \rangle^{\circ}$. We wish to prove that the induced map $F(C, \beta^{-1}\{j\}) \to F(C', \{j\})$ is locally q-coCartesian. Lift the morphism $\rho^j : \langle n \rangle \to \langle 1 \rangle$ to an inert morphism $C' \to C''$ in $\mathcal{C}^{\otimes}$. Condition ($2'$) implies the induced map $F(C', \{j\}) \to F(C'', \{1\})$ is an equivalence. We may therefore replace C' by C'' and thereby reduce to the case where $n' = 1$. The map $\widetilde{\beta}$ factors as a composition

$$C \overset{\widetilde{\beta}'}{\to} C_0 \overset{\widetilde{\beta}''}{\to} C'$$

小红书
小红书号:3189205503 qq

where $\widetilde{\beta}'$ is inert and $\widetilde{\beta}''$ is active. Using (2′) again, we deduce that $F(\widetilde{\beta}')$ is an equivalence. We may therefore replace C by C_0 and thereby reduce to the case where $\widetilde{\beta}$ is active, so that $\beta^{-1}\{1\} = \langle n \rangle^\circ$. We are therefore reduced to proving that $F(\widetilde{\beta})$ is locally p-coCartesian, which follows from (1′).

Now suppose that F satisfies (1) and (2). We first verify that F satisfies (2′). Fix an object $C \in \mathcal{C}^{\otimes}_{\langle n \rangle}$ and a subset $J \subseteq \langle n \rangle^\circ$, and choose an inert morphism $C \to C'$ covering the canonical map $\langle n \rangle \to J_*$. We wish to prove that the induced map $F(C, J) \to F(C', J)$ is an equivalence in $\mathcal{D}$. Using condition (1), we are reduced to proving that the induced map $F(C, \{j\}) \to F(C', \{j\})$ is an equivalence for each $j \in J$, which is a special case of (2).

We now verify condition (1′). We first show that for each vertex $s \in S$, F' induces a weak Cartesian structure on the ∞-operad $\mathcal{C}^{\otimes}_s$. Suppose that $C \in \mathcal{C}^{\otimes}_{s,\langle n \rangle}$, and choose inert morphisms $C \to C_i$ lying over $\rho^i : \langle n \rangle \to \langle 1 \rangle$ for $1 \leq i \leq n$. We wish to show that the induced maps $F'(C) \to F'(C_i)$ exhibit $F'(C)$ as a product of the objects $F(C_i)$ in the ∞-category $\mathcal{D}_s$. It follows from condition (1) that $F'(C)$ is a product of the objects $F(C, \{i\})$ for $1 \leq i \leq n$. It therefore suffices to show that each of the maps $F(C, \{i\}) \to F(C_i, \{1\})$ is an equivalence, which follows from (2). To complete the proof that F' is a weak Cartesian structure on $\mathcal{C}^{\otimes}$, it suffices to show that if $e : C \to C'$ is a locally p-coCartesian morphism in $\mathcal{C}^{\otimes}$ covering an active map $\langle n \rangle \to \langle 1 \rangle$ in $\mathrm{N}(\mathcal{F}\mathrm{in}_*)$, then $F'(e)$ is locally q-coCartesian. This is also a special case of assumption (2). □

Theorem 6.3.1.15. *Fix a simplicial set S.*

(1) *Let $p : \mathcal{C} \to S$ be a locally coCartesian fibration, and suppose that for each vertex $s \in S$, the ∞-category $\mathcal{C}_s$ admits finite products. Then there exists a Cartesian local S-family of ∞-operads $p : \mathcal{O}^{\otimes} \to S \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ and a Cartesian structure $\pi : \mathcal{O}^{\otimes} \to \mathcal{C}$. In particular, there is an equivalence $\mathcal{C} \simeq \mathcal{O}$ (of locally coCartesian fibrations over S).*

(2) *Let $p : \mathcal{C}^{\otimes} \to S \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ and $q : \mathcal{D}^{\otimes} \to S \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ be Cartesian S-families of ∞-operads, let $\mathrm{Fun}^{\otimes}_S(\mathcal{C}^{\otimes}, \mathcal{D}^{\otimes})$ be defined as in Notation 6.3.1.13, and let $\mathrm{Fun}^{\times}_S(\mathcal{C}, \mathcal{D})$ be defined as in Proposition 6.3.1.9. Then the restriction map $\theta : \mathrm{Fun}^{\otimes}_S(\mathcal{C}^{\otimes}, \mathcal{D}^{\otimes}) \to \mathrm{Fun}^{\times}_S(\mathcal{C}, \mathcal{D})$ is an equivalence of ∞-categories.*

Proof. Assertion (1) follows immediately from Proposition 2.4.1.5. To prove (2), we first define $\mathcal{D}^{\times}$ as in the proof of Proposition 2.4.1.5. Since $\mathcal{D}^{\otimes}$ is a Cartesian S-family of ∞-operads, Proposition 6.3.1.9 implies that there exists a Cartesian structure $\pi : \mathcal{D}^{\otimes} \to \mathcal{D}$. Using Proposition 6.3.1.14, we can assume that π factors as a composition

$$\mathcal{D}^{\otimes} \xrightarrow{\phi} \mathcal{D}^{\times} \xrightarrow{\pi'} \mathcal{D},$$

where π' is the Cartesian structure of Proposition 2.4.1.5 and $\phi \in \mathrm{Fun}^{\otimes}_S(\mathcal{D}^{\otimes}, \mathcal{D}^{\times})$. For every vertex $s \in S$ and each $\langle n \rangle \in \mathrm{N}(\mathcal{F}\mathrm{in}_*)$, the induced map

$$\mathcal{D}^{\otimes}_{s,\langle n \rangle} \to \mathcal{D}^{\times}_{s,\langle n \rangle}$$

小红书 小红书号:3189205503 qq

is an equivalence of ∞-categories (since both sides can be identified with the nth power of the ∞-category $\mathcal{D}_s$). It follows that ϕ is a categorical equivalence. We may therefore replace $\mathcal{D}^{\otimes}$ by $\mathcal{D}^{\times}$. In this case, the functor θ factors as a composition

$$\mathrm{Fun}^{\otimes}_S(\mathcal{C}^{\otimes}, \mathcal{D}^{\times}) \xrightarrow{\theta'} \mathrm{Fun}^{\times}_S(\mathcal{C}^{\otimes}, \mathcal{D}) \xrightarrow{\theta''} \mathrm{Fun}^{\times}_S(\mathcal{C}, \mathcal{D}),$$

where θ' is an equivalence of ∞-categories by Proposition 6.3.1.14 and θ'' is an equivalence of ∞-categories by Proposition 6.3.1.9. □

6.3.2 Composition of Correspondences

Let $F : \mathcal{C} \to \mathcal{D}$ be a reduced functor between compactly generated pointed ∞-categories which commutes with filtered colimits. Propositions 6.3.0.14 and 6.3.1.3 can be summarized informally as follows: the symmetric sequences $\partial^*(\mathrm{id}_{\mathcal{C}})$ and $\partial^*(\mathrm{id}_{\mathcal{D}})$ are equipped with coherently associative comultiplications

$$\partial^*(\mathrm{id}_{\mathcal{C}}) \to \partial^*(\mathrm{id}_{\mathcal{C}}) \circ \partial^*(\mathrm{id}_{\mathcal{C}}) \qquad \partial^*(\mathrm{id}_{\mathcal{D}}) \to \partial^*(\mathrm{id}_{\mathcal{D}}) \circ \partial^*(\mathrm{id}_{\mathcal{D}}),$$

and the symmetric sequence $\partial^*(F)$ is equipped with commuting coactions

$$\partial^*(F) \to \partial^*(\mathrm{id}_{\mathcal{D}}) \circ \partial^*(F) \qquad \partial^*(F) \to \partial^*(F) \circ \partial^*(\mathrm{id}_{\mathcal{C}}).$$

We can regard these assertions as a dual version of parts (1) and (2) of Conjecture 6.3.0.7. In this section, we will study the analogue of the third part of Conjecture 6.3.0.7. That is, we wish to show that if $G : \mathcal{D} \to \mathcal{E}$ is another reduced functor between compactly generated pointed ∞-categories which commutes with filtered colimits, then the symmetric sequence $\partial^*(G \circ F)$ can be regarded as a kind of tensor product of $\partial^*(G)$ with $\partial^*(F)$ over $\partial^*(\mathrm{id}_{\mathcal{D}})$. We begin by formalizing this idea more precisely using the language of stable families of ∞-operads.

Suppose that $p : \mathcal{O}^{\otimes} \to \Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ is a corepresentable Δ^2-family of ∞-operads. Taking the fibers of the map $\mathcal{O}^{\otimes} \to \Delta^2$, we obtain corepresentable ∞-operads $\mathcal{O}_0^{\otimes}$, $\mathcal{O}_1^{\otimes}$, and $\mathcal{O}_2^{\otimes}$, and in particular we obtain tensor product functors

$$\otimes_0^I : \mathcal{O}_0^I \to \mathcal{O}_0 \qquad \otimes_1^I : \mathcal{O}_1^I \to \mathcal{O}_1 \qquad \otimes_2^I : \mathcal{O}_2^I \to \mathcal{O}_2$$

(see Remark 6.2.4.4). Taking the inverse image of edges in Δ^2, we obtain corepresentable correspondences from $\mathcal{O}_i^{\otimes}$ to $\mathcal{O}_j^{\otimes}$ for $i < j$. In particular, for every finite set I, we obtain functors

$$F^I : \mathcal{O}_0^I \to \mathcal{O}_1 \qquad G^I : \mathcal{O}_1^I \to \mathcal{O}_2 \qquad H^I : \mathcal{O}_0^I \to \mathcal{O}_2$$

(see the discussion following Definition 6.3.1.1). Every equivalence relation E on a finite set I determines a 2-simplex $(0, I_*) \to (1, (I/E)_*) \to (2, \langle 1 \rangle)$ in $\Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$, to which the locally coCartesian fibration p associates a natural transformation

$$H^I \to G^{I/E} \circ \prod_{J \in I/E} F^J$$

小红书
小红书号:3189205503 qq

of functors from $\mathcal{O}_0^I$ to $\mathcal{O}_2$. If $\mathcal{O}^\otimes$ is a stable Δ^2-family of ∞-operads, then we obtain a map of symmetric sequences $\delta : H^* \to G^* \circ F^*$ in the ∞-category $\mathrm{SSeq}(\mathcal{O}_0, \mathcal{O}_2)$. By studying the restriction of p to 3-simplices of $\Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$, it is not difficult to verify that the diagram of symmetric sequences

$$\begin{array}{ccc} H^* & \xrightarrow{\delta} & G^* \circ F^* \\ \downarrow{\scriptstyle \delta} & & \downarrow{\scriptstyle \mathrm{id} \circ \phi} \\ G^* \circ F^* & \xrightarrow{\psi \circ \mathrm{id}} & G^* \circ \otimes_1^* \circ F^* \end{array}$$

commutes up to homotopy, where $\phi : F^* \to \otimes_1^* \circ F^*$ and $\psi : G^* \to G^* \circ \otimes_1^*$ are given by the coactions of $\otimes_1^*$ on F^* and G^*, respectively. By studying the inverse image under p of higher-dimensional simplices of $\Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$, we obtain certain higher coherence conditions. We may summarize the situation informally as follows:

($*$) A stable Δ^2-family of ∞-operads $\mathcal{O}^\otimes \to \Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ determines coalgebras $\otimes_i^* \in \mathrm{SSeq}(\mathcal{O}_i, \mathcal{O}_i)$, an $\otimes_1^*$-$\otimes_0^*$ bimodule $F^* \in \mathrm{SSeq}(\mathcal{O}_0, \mathcal{O}_1)$, an $\otimes_2^*$-$\otimes_1^*$ bimodule $G^* \in \mathrm{SSeq}(\mathcal{O}_1, \mathcal{O}_2)$, and a map of $\otimes_2^*$-$\otimes_0^*$ bimodules $H^* \to G^* \circ^{\otimes_1^*} F^*$ in $\mathrm{SSeq}(\mathcal{O}_0, \mathcal{O}_2)$.

Now suppose we are given compactly generated pointed ∞-categories $\mathcal{C}$, $\mathcal{D}$, and $\mathcal{E}$, together with reduced functors $F : \mathcal{C} \to \mathcal{D}$, $G : \mathcal{D} \to \mathcal{E}$, and $H : \mathcal{C} \to \mathcal{E}$ commuting with filtered colimits, and a natural transformation $\alpha : H \to G \circ F$. We can encode this data by locally coCartesian fibration $\mathcal{M} \to \Delta^2$ with $\mathcal{M}_0 \simeq \mathcal{C}$, $\mathcal{M}_1 \simeq \mathcal{D}$, and $\mathcal{M}_2 \simeq \mathcal{D}$ Let $p : \mathcal{M}^\times \to \Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ be as in Construction 6.3.1.10. Then p is a differentiable Δ^2-family of ∞-operads, so it admits a stabilization $q : \mathcal{O}^\otimes \to \Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$. According to ($*$), the stable Δ^2-family of ∞-operads q determines a map of symmetric sequences

$$\alpha^+ : \partial^*(H) \to \partial^*(G) \circ^{\partial^*(\mathrm{id}_\mathcal{D})} \partial^*(F).$$

We would like to say that if α is an equivalence (that is, if the map $\mathcal{M} \to \Delta^2$ is actually a coCartesian fibration), then the map α^+ is also an equivalence. What we will actually prove is a reformulation of this assertion, which does not require us to define (relative) composition products of symmetric sequences or to justify the heuristic ($*$) given above. Our reformulation is based on the notion of a *thin* Δ^2-family of ∞-operads (Definition 6.3.2.12). Informally speaking, a stable Δ^2-family of ∞-operads $\mathcal{O}^\otimes \to \Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ is *thin* if it determines a morphism $H^* \to G^* \circ^{\otimes_1^*} F^*$ which is an equivalence in $\mathrm{SSeq}(\mathcal{O}_0, \mathcal{O}_2)$. However, the precise definition of thinness does not directly reference the theory of symmetric sequences, and makes sense also in unstable situations. Granting the notion of flatness, we can formulate our main result as follows:

Theorem 6.3.2.1. *Let $p : \mathcal{C} \to \Delta^2$ be a coCartesian fibration. Assume that the fibers of p are pointed and compactly generated, and that for $i < j$ the induced functor $\mathcal{C}_i \to \mathcal{C}_j$ is reduced and preserves filtered colimits. Let $q : \overline{\mathcal{C}}^\otimes \to \Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ be a stabilization of the differentiable Δ^2-family of ∞-operads $\mathcal{C}^\times \to \Delta^2 \to \mathrm{N}(\mathcal{F}\mathrm{in}_*)$. Then $\overline{\mathcal{C}}^\otimes$ is a thin Δ^2-family of ∞-operads.*

小红书
小红书号:3189205503 qq

Theorem 6.3.2.1 is an immediate consequence of the following pair of assertions:

Theorem 6.3.2.2. *Let $p : \mathcal{C}^{\otimes} \to \Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ be a Cartesian Δ^2-family of ∞-operads, and suppose that the underlying locally coCartesian fibration $p_0 : \mathcal{C} \to \Delta^2$ is a coCartesian fibration. Then $\mathcal{C}^{\otimes}$ is a thin Δ^2-family of ∞-operads.*

Theorem 6.3.2.3. *Let $q : \mathcal{C}^{\otimes} \to \Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ be a corepresentable Δ^2-family of ∞-operads. Assume that:*

(1) *Each of the ∞-categories $\mathcal{C}_i$ is pointed and compactly generated.*

(2) *For every pair of induces $0 \leq i \leq j \leq 2$ and every finite set I, the induced functor $\mathcal{C}_i^I \to \mathcal{C}_j$ preserves filtered colimits and zero objects.*

(3) *Let $0 \leq i \leq 2$, let $\alpha : \langle m \rangle \to \langle n \rangle$ be an injective map of pointed finite sets, and let $\overline{\alpha}$ be a morphism in $\mathcal{C}^{\otimes}$ lifting the induced map $(i, \langle m \rangle) \to (i, \langle n \rangle)$. If α is locally q-coCartesian, then α is q-coCartesian.*

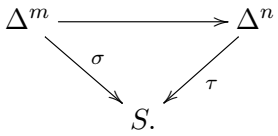
Let $\overline{\mathcal{C}}^{\otimes} \to \Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ be a stabilization of $\mathcal{C}^{\otimes}$. If $\mathcal{C}^{\otimes}$ is a thin Δ^2-family of ∞-operads, then $\overline{\mathcal{C}}^{\otimes}$ is also a thin Δ^2-family of ∞-operads.

Remark 6.3.2.4. Let $q : \mathcal{C}^{\otimes} \to \Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ be a corepresentable Δ^2-family of ∞-operads satisfying conditions (1) and (2). Then each of the ∞-categories $\mathcal{C}_i$ admits a zero object $*_i$. If S is a finite set and $0 \leq i \leq j \leq 2$, then q determines a functor $F^S_{i,j} : \mathcal{C}_i^S \to \mathcal{C}_j$ satisfying $F^S_{i,j}(*_i, *_i, \ldots, *_i) \simeq *_j$. Moreover, for every finite set T, we have canonical maps

$$F^S_{i,j}(\{X_s\}_{s \in S}) \to F^{S \cup T}_{i,j}(\{X_s\}_{s \in S}, \{*_i\}_{t \in T}).$$

Condition (3) of Theorem 6.3.2.1 asserts that each of these maps is an equivalence. Note that this condition is automatically satisfied if q is a Cartesian Δ^2-family of ∞-operads.

We will prove Theorem 6.3.2.2 at the end of this section. The proof of Theorem 6.3.2.3 is quite a bit more difficult, and will be given in §6.3.6.

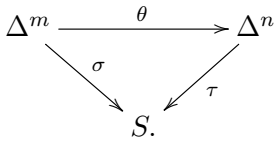


Our first step is to define the notion of a thin Δ^2-family of ∞-operads. This will require a brief digression. Suppose that $q : X \to S$ is a locally coCartesian fibration of simplicial sets. Then every edge $e : s \to t$ in S induces a functor of ∞-categories $X_s \to X_t$. More generally, we can associate to every n-simplex $\sigma : \Delta^n \to S$ a functor from $X_{\sigma(0)}$ to $X_{\sigma(n)}$, given by the composition of the functors

$$\theta(\sigma) : X_{\sigma(0)} \to X_{\sigma(1)} \to \cdots \to X_{\sigma(n)}$$

associated to the edges belonging to the "spine" of Δ^n. If q is a coCartesian fibration, then the functor $\theta(\sigma)$ depends only on the edge $\sigma(0) \to \sigma(n)$ of S determined by σ. However, if we assume only that q is a locally coCartesian fibration, then $\theta(\sigma)$ depends on the entire simplex σ. We will need to precisely articulate the sense in which the functor $\theta(\sigma)$ depends on σ.

小红书
小红书号:3189205503 qq



Notation 6.3.2.5. Let S be a simplicial set. We let $\mathbf{\Delta}_S$ denote the *category of simplices* of S. The objects of $\mathbf{\Delta}_S$ are maps $\sigma : \Delta^m \to S$. Given a pair of objects $\sigma : \Delta^m \to S$ and $\tau : \Delta^n \to S$, we let $\mathrm{Hom}_{\mathbf{\Delta}_S}(\sigma, \tau)$ denote the collection of commutative diagrams

Suppose we are given a pair of vertices $s, t \in S$. We define a subcategory $\mathbf{\Delta}_S^{s,t}$ as follows:

(i) An object $\sigma : \Delta^m \to S$ belongs to $\mathbf{\Delta}_S^{s,t}$ if $n \geq 1$, $\sigma(0) = s$, and $\sigma(n) = t$.

(ii) Given objects $\sigma, \tau \in \mathbf{\Delta}_S^{s,t}$, a commutative diagram

determines a morphism in $\mathbf{\Delta}_S^{s,t}$ if and only if $\theta(0) = 0$ and $\theta(m) = n$.

Construction 6.3.2.6. Let $q : X \to S$ be a locally coCartesian fibration of simplicial sets, and suppose we are given vertices $s, t \in S$. We define a functor $\phi : (\mathbf{\Delta}_S^{s,t})^{op} \to \mathcal{S}\mathrm{et}_\Delta$ by the formula $\phi(\sigma : \Delta^m \to S) = \mathrm{Fun}_S(\Delta^m, X)^{op}$. Let $\mathcal{Z}$ denote the opposite of the relative nerve $\mathrm{N}_\phi((\mathbf{\Delta}_S^{s,t}))$ (see Definition HTT.3.2.5.2). Then $\mathcal{Z}$ is an ∞-category equipped with a Cartesian fibration $\mathcal{Z} \to \mathrm{N}(\mathbf{\Delta}_S^{s,t})$. Unwinding the definitions, we can identify the objects of $\mathcal{Z}$ with simplices $\sigma : \Delta^n \to X$ such that $n \geq 1$, $\sigma(0) \in X_s$, and $\sigma(n) \in X_t$. Note that the evaluation maps $\sigma \mapsto \sigma(0)$ and $\tau \mapsto \tau(0)$ determine functors $e_s : \mathcal{Z}_q \to X_s$ and $e_t : \mathcal{Z}_q \to X_t$.

Let $\mathcal{Z}^0$ denote the full subcategory of $\mathcal{Z}$ spanned by those simplices $\sigma : \Delta^n \to X$ such that, for each $1 \leq i \leq n$, the map $\sigma(i-1) \to \sigma(i)$ is locally q-coCartesian.

Lemma 6.3.2.7. *Let $q : X \to S$ be a locally coCartesian fibration of simplicial sets, let $s, t \in S$ be vertices, and let $\mathcal{Z}^0 \subseteq \mathcal{Z}$ be defined as in Construction 6.3.2.6. For each $\sigma \in \mathbf{\Delta}_S^{s,t}$, let $\mathcal{Z}_\sigma$ denote the fiber of $\mathcal{Z} \to \mathrm{N}(\mathbf{\Delta}_S^{s,t})^{op}$ over σ, and define $\mathcal{Z}_\sigma^0$ similarly. Then:*

(a) *For each $\sigma \in \mathbf{\Delta}_S^{s,t}$, the map e_s induces a trivial Kan fibration $\mathcal{Z}_\sigma^0 \to X_s$.*

(b) *For every object $\sigma \in \mathbf{\Delta}_S^{s,t}$, the inclusion $\mathcal{Z}_\sigma^0 \hookrightarrow \mathcal{Z}_\sigma$ admits a right adjoint L_σ. Moreover, if α is a morphism in $\mathcal{Z}_\sigma$, then $L_\sigma(\alpha)$ is an equivalence if and only if $e_0(\alpha)$ is an equivalence, where $e_0 : \mathcal{Z}_\sigma \to X_s$ is defined as in Construction 6.3.2.6.*

(c) *The forgetful functor $f : \mathcal{Z} \to \mathrm{N}(\mathbf{\Delta}_S^{s,t})^{op}$ restricts to a Cartesian fibration $f^0 : \mathcal{Z}^0 \to \mathrm{N}(\mathbf{\Delta}_S^{s,t})$.*

小红书
小红书号:3189205503 qq

(*d*) *The map e_s induces an equivalence of ∞-categories*

$$\mathcal{Z}^0_\sigma \to X_s \times \mathrm{N}(\mathbf{\Delta}^{s,t}_S).$$

Proof. We first prove (*a*). Fix an object $\sigma : \Delta^n \to S$ of $\mathbf{\Delta}^{s,t}_S$. For $0 \leq j \leq n$, let

$$\mathcal{C}_j = \mathrm{Fun}_S(\Delta^{\{0,1\}} \coprod_{\{1\}} \Delta^{\{1,2\}} \coprod \cdots \coprod_{\{j-1\}} \Delta^{\{j-1,j\}}, X),$$

and let $\mathcal{C}'_j$ denote the full subcategory of $\mathcal{C}_j$ spanned by those diagrams which carry each edge $\Delta^{\{i-1,i\}}$ to a q-coCartesian edge of X for $1 \leq i \leq j$. Each of the restriction maps $\mathcal{C}'_j \to \mathcal{C}'_{j-1}$ is a pullback of the restriction map

$$r_j : \mathrm{Fun}'_S(\Delta^{\{j-1,j\}}, X) \to \mathrm{Fun}_S(\{j-1\}, X),$$

where $\mathrm{Fun}'_S(\Delta^{\{j-1,j\}}, X)$ denotes the full subcategory of $\mathrm{Fun}_S(\Delta^{\{j-1,j\}}, X)$ spanned by the locally q-coCartesian edges. Proposition HTT.4.3.2.15 (and our assumption that q is a locally coCartesian fibration) imply that each r_j is a trivial Kan fibration. We have a pullback diagram

$$\begin{array}{ccc} \mathcal{Z}^0_\sigma & \longrightarrow & \mathcal{C}'_n \\ \downarrow & & \downarrow \\ \mathcal{Z}_\sigma & \longrightarrow & \mathcal{C}_n . \end{array}$$

The lower horizonal map is a trivial Kan fibration because the inclusion

$$\Delta^{\{0,1\}} \coprod_{\{1\}} \Delta^{\{1,2\}} \coprod \cdots \coprod_{\{n-1\}} \Delta^{\{n-1,n\}} \hookrightarrow \Delta^n$$

is inner anodyne. It follows that the restriction map $\mathcal{Z}^0_\sigma \to \mathcal{C}'_n$ is a trivial Kan fibration, so that the composite map

$$\theta : \mathcal{Z}^0_\sigma \to \mathcal{C}'_n \to \mathcal{C}'_{n-1} \to \cdots \to \mathcal{C}'_1 \to \mathcal{C}'_0 \simeq X_s$$

is a trivial Kan fibration, as desired.

We now prove (*b*). Let σ be as above, and let $s : X_s \to \mathcal{Z}^0_\sigma$ be a section of the trivial Kan fibration $\theta_0 : \mathcal{Z}^0_\sigma$. We will show that the identity map $\mathrm{id}_{X_s} \to \theta_0 \circ s$ exhibits s as a left adjoint to θ_0; it will then follow from (*a*) that the composition $s \circ \theta_0$ is a right adjoint to the inclusion. Fix an object $x \in X_s$ and an object $z \in \mathcal{Z}_\sigma$; we wish to show that the canonical map

$$\mathrm{Map}_{\mathcal{Z}_\sigma}(s(x), z) \to \mathrm{Map}_{X_s}(x, \theta_0(z))$$

is a homotopy equivalence. For each $0 \leq j \leq n$, let $\theta_j : \mathcal{Z}_\sigma \to \mathcal{C}_j$ be the restriction functor. We will prove that each of the maps

$$\mathrm{Map}_{\mathcal{Z}_\sigma}(s(x), z) \to \mathrm{Map}_{\mathcal{C}_j}(\theta_j s(x), \theta_j(z))$$

小红书
小红书号:3189205503 qq

is a homotopy equivalence using descending induction on j. When $j = n$, the desired result is obvious (since θ_n is a trivial Kan fibration), and when $j = 0$ it will imply the desired result. To carry out the inductive step, it will suffice to show that the map

$$u : \mathrm{Map}_{\mathcal{C}_j}(\theta_j s(x), \theta_j(z)) \to \mathrm{Map}_{\mathcal{C}_{j-1}}(\theta_{j-1} s(x), \theta_{j-1}(z))$$

is a homotopy equivalence. Let x' and z' be the images of $s(x)$ and z in $\mathrm{Fun}_S(\Delta^{\{j-1,j\}}, X)$ and let x'_0 and z'_0 be their images in $X_{\sigma(j-1)}$. Then u is a pullback of the restriction map

$$\mathrm{Map}_{\mathrm{Fun}_S(\Delta^{\{j-1,j\}},X)}(x', z') \to \mathrm{Map}_{X_{\sigma(j-1)}}(x'_0, z'_0),$$

which is a homotopy equivalence by virtue of the fact that x' is a locally q-coCartesian edge of X.

Assertion (c) follows from (b) and Lemma 2.2.1.11, and assertion (d) follows from Corollary HTT.2.4.4.4 together with (a) and (c). □

Definition 6.3.2.8. Let $q : X \to S$ be a locally coCartesian fibration of simplicial sets. Let $s, t \in S$ be vertices, let $\mathcal{Z}^0 \subseteq \mathcal{Z}$ be defined as in Construction 6.3.2.6, and let $h : X_s \times \mathrm{N}(\mathbf{\Delta}^{s,t}_S) \to \mathcal{Z}^0$ be a homotopy inverse to the equivalence of ∞-categories $\mathcal{Z}^0 \to X_s \times \mathrm{N}(\mathbf{\Delta}^{s,t}_S)$ of Lemma 6.3.2.7. The composite map

$$X_s \times \mathrm{N}(\mathbf{\Delta}^{s,t}_S) \xrightarrow{h} \mathcal{Z}^0 \subseteq \mathcal{Z} \xrightarrow{e_t} X_t$$

determines a functor $\theta : \mathrm{N}(\mathbf{\Delta}^{s,t}_S) \to \mathrm{Fun}(X_s, X_t)$, which is well-defined up to homotopy. We will refer to θ as the *spray* associated to q.

Remark 6.3.2.9. In the situation of Definition 6.3.2.8, suppose that $\sigma : \Delta^n \to S$ is an object of $\mathbf{\Delta}^{s,t}_S$, so that σ determines a sequence of edges

$$s = s_0 \xrightarrow{f(1)} s_1 \xrightarrow{f(2)} \cdots \xrightarrow{f(n)} s_n = t.$$

Since q is a coCartesian fibration, each of the edges $f(i)$ determines a functor $f(i)_! : X_{\sigma(i-1)} \to X_{\sigma(i)}$. If $\theta : \mathrm{N}(\mathbf{\Delta}^{s,t}_S) \to \mathrm{Fun}(X_s, X_t)$ is the spray associated to q, then $\theta(\sigma)$ is given (up to homotopy) by the composition $f(n)_! \circ f(n-1)_! \circ \cdots \circ f(1)_!$.

Remark 6.3.2.10. In the situation of Definition 6.3.2.8, suppose that the map $q : X \to S$ is a coCartesian fibration of simplicial sets. Then the spray $\theta : \mathrm{N}(\mathbf{\Delta}^{s,t}_S) \to \mathrm{Fun}(X_s, X_t)$ is locally constant: that is, it carries each morphism in $\mathbf{\Delta}^{s,t}_S$ to an equivalence in $\mathrm{Fun}(X_s, X_t)$.

Notation 6.3.2.11. Let S be a finite set, and let $\mathrm{Equiv}(S)$ be the partially ordered set of equivalence relations on S (see Construction 6.3.3.12). We let $\mathrm{Part}(S)$ denote the partially ordered set consisting of linearly ordered subsets of $\mathrm{Equiv}(S)$. We regard $\mathrm{Part}(S)$ as partially ordered with respect to inclusions. Let $\mathrm{Part}^0(S) \subseteq \mathrm{Part}(S)$ denote the subset consisting of *nonempty* linearly ordered subsets of $\mathrm{Equiv}(S)$.

小红书
小红书号:3189205503 qq

Suppose that $S = \{1, \ldots, n\}$. The construction

$$(E \in \mathrm{Equiv}(S)) \mapsto (S/E)_*$$

determines a functor $\mathrm{Equiv}(S) \to \mathcal{F}\mathrm{in}_*$. Let $s = (0, \langle n \rangle) \in \Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ and $t = (2, \langle 1 \rangle) \in \Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$. We define a functor

$$\chi : \mathrm{Part}(S) \to \mathbf{\Delta}^{s,t}_{\Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)}$$

as follows: to every chain of equivalence relations $E_1 \subseteq E_2 \subseteq \cdots \subseteq E_k$ in $\mathrm{Equiv}(S)$, χ associates the $(k+1)$-simplex of $\Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ given by the sequence of active morphisms

$$(0, \langle n \rangle) \to (1, (S/E_1)_*) \to (1, (S/E_2)_*) \to \cdots \to (1, (S/E_k)_*) \to (2, \langle 1 \rangle).$$

Definition 6.3.2.12. Let $q : \mathcal{O}^\otimes \to \Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ be a Δ^2-family of ∞-operads. We will say that $\mathcal{O}^\otimes$ is *thin* if is corepresentable, the ∞-category $\mathcal{O}_2$ admits finite limits and the following condition is satisfied for each $n \geq 1$:

($*$) Let $S = \{1, \ldots, n\}$, let $T = \Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$, let $\chi : \mathrm{Part}(S) \to \mathbf{\Delta}^{s,t}_T$ be as in Notation 6.3.2.11 and let $\theta : \mathrm{N}(\mathbf{\Delta}^{s,t}_T) \to \mathrm{Fun}(\mathcal{O}^\otimes_{\langle n \rangle}, \mathcal{O})$ be the spray associated to q (see Definition 6.3.2.8). Then the composite map

$$\mathrm{N}(\mathrm{Part}^0(S))^\triangleleft \simeq \mathrm{N}(\mathrm{Part}(S)) \xrightarrow{\chi} \mathrm{N}(\mathbf{\Delta}^{s,t}_T) \xrightarrow{\theta} \mathrm{Fun}(\mathcal{O}^\otimes_{(0,\langle n \rangle)}, \mathcal{O}^\otimes_{(2,\langle 1 \rangle)}) \simeq \mathrm{Fun}(\mathcal{O}_0^S, \mathcal{O}_2)$$

is a limit diagram in the ∞-category $\mathrm{Fun}(\mathcal{O}_0^S, \mathcal{O}_2)$.

Remark 6.3.2.13. Let $q : \mathcal{O}^\otimes \to \Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ be a corepresentable Δ^2-family of ∞-operads, so that q determines functors

$$\otimes_0^m : \mathcal{O}_0^m \to \mathcal{O}_0 \qquad \otimes_1^m : \mathcal{O}_1^m \to \mathcal{O}_1 \qquad \otimes_2^m : \mathcal{O}_2^m \to \mathcal{O}_2$$

$$F^m : \mathcal{O}_0^m \to \mathcal{O}_1 \qquad G^m : \mathcal{O}_1^m \to \mathcal{O}_2 \qquad H^m : \mathcal{O}_0^m \to \mathcal{O}_2$$

for every integer $m \geq 0$. When $n = 1$, condition ($*$) of Definition 6.3.2.12 asserts that for every object $X \in \mathcal{O}_0$, the canonical map $H^1(X) \to G^1(F^1(X))$ is an equivalence. When $n = 2$, condition ($*$) of Definition 6.3.2.12 guarantees that for every pair of objects $X, Y \in \mathcal{O}_0$, the diagram

$$\begin{array}{ccc} H^2(X,Y) & \longrightarrow & G^1(F^2(X,Y)) \\ \downarrow & & \downarrow \\ G^2(F^1(X), F^1(Y)) & \longrightarrow & G^1(F^1(X) \otimes_1^2 F^1(X)). \end{array}$$

For larger values of n, condition ($*$) guarantees that the functor $H^n : \mathcal{O}_0^n \to \mathcal{O}_2$ can be recovered as the limit of a finite diagram of functors obtained by composing the functors F^p, G^q, and $\otimes_1^r$ for $p, q, r > 0$.

小红书
小红书号:3189205503 qq

Remark 6.3.2.14. To place Definition 6.3.2.12 in context, we remark that there exists an $(\infty, 2)$-category SSeq which may be described roughly as follows:

- The objects of SSeq are pairs $(\mathcal{O}, U^*)$, where $\mathcal{O}$ is a stable ∞-category and U^* is a coalgebra object of $\mathrm{SSeq}(\mathcal{O}, \mathcal{O})$ whose counit induces an equivalence $U^1 \to \mathrm{id}_{\mathcal{O}}$ (equivalently, we can define the objects of SSeq to be unital stable ∞-operads: see Remark 6.3.0.10).
- Given a pair of objects $(\mathcal{O}, U^*), (\mathcal{O}', U'^*) \in \mathrm{SSeq}$, the ∞-category of morphisms from $(\mathcal{O}, U^*)$ to $(\mathcal{O}', U'^*)$ in SSeq can be identified with the collection of U'^*-U^* comodule objects of $\mathrm{SSeq}(\mathcal{O}, \mathcal{O}')$ (which we can think of as stable correspondences between the corresponding stable ∞-operads: see Remark 6.3.1.2).

Every stable Δ^2-family of ∞-operads $q : \mathcal{O}^{\otimes} \to \Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ determines 1-morphisms

$$f : (\mathcal{O}_0, \otimes_0^*) \to (\mathcal{O}_1, \otimes_1^*) \qquad g : (\mathcal{O}_1, \otimes_1^*) \to (\mathcal{O}_2, \otimes_2^*) \qquad h : (\mathcal{O}_2, \otimes_0^*) \to (\mathcal{O}_2, \otimes_2^*)$$

together with a 2-morphism $\alpha : h \to g \circ f$ in the $(\infty, 2)$-category SSeq. The thinness of q is equivalent to the invertibility of the 2-morphism α.

We warn the reader that this $(\infty, 2)$-categorical interpretation of Definition 6.3.2.12 is specific to the case of stable families of ∞-operads, and can lead to misleading intuitions in the unstable case.

Proof of Theorem 6.3.2.2. Let $\mathcal{C}_0$, $\mathcal{C}_1$, and $\mathcal{C}_2$ denote the fibers of the coCartesian fibration $p_0 : \mathcal{C} \to \Delta^2$, so that p_0 determines functors $F : \mathcal{C}_0 \to \mathcal{C}_1$ and $G : \mathcal{C}_1 \to \mathcal{C}_2$. Fix a nonempty finite set I. The construction of Notation 6.3.2.11 determines a functor $\theta : \mathrm{N}(\mathrm{Part}(I)) \to \mathrm{Fun}(\mathcal{C}_0^I, \mathcal{C}_2)$. We wish to show that for every sequence of objects $\vec{C} = \{C_i \in \mathcal{C}_0\}_{i \in I}$, the induced map

$$\theta(\emptyset)(\vec{C}) \to \varinjlim_{P \in \mathrm{Part}^0(I)} \theta(P)(\vec{C})$$

is an equivalence in $\mathcal{C}_2$. Unwinding the definitions, we see that θ carries a nonempty chain of equivalence relations $P = (E_1 \subset E_2 \subset \cdots \subset E_k)$ to the functor $\theta(P)$ given by the formula

$$\theta(P)(\{C_i\}) = G(\coprod_{J \in I/E_1} F(\prod_{j \in J} C_j)).$$

In particular, $\theta^0 = \theta | \mathrm{N}(\mathrm{Part}^0(I))$ factors as a composition

$$\mathrm{N}(\mathrm{Part}^0(I)) \xrightarrow{\phi} \mathrm{N}(\mathrm{Equiv}(I))^{op} \xrightarrow{\psi} \mathrm{Fun}(\mathcal{C}_0^I, \mathcal{C}_2),$$

where ϕ carries a chain of equivalence relations $(E_1 \subset E_2 \subset \cdots \subset E_k)$ to the equivalence relation E_1. We claim that ϕ is right cofinal. Since ϕ is a coCartesian fibration, it suffices to show that the

小红书
小红书号:3189205503 qq

fibers of ϕ are weakly contractible (Lemma HTT.4.1.3.2). This is clear, since each of these fibers has both an initial object. We are therefore reduced to proving that the canonical map

$$\theta(\emptyset)(\vec{C}) \to \varprojlim_{E \in \mathrm{Equiv}(I)} \psi(E)(\{C_i\})$$

is an equivalence. Note that $\mathrm{N}(\mathrm{Equiv}(I))$ has a final object, given by the indiscrete equivalence relation $E_\top$ (such that $iE_\top j$ for all $i, j \in I$). We are therefore reduced to proving that the natural transformation $\theta(\emptyset) \to \psi(E_\top)$ is an equivalence of functors from $\mathcal{C}_0^I$ to $\mathcal{C}_2$, which follows immediately from the definitions. □

6.3.3 Derivatives of the Identity Functor

Let $\mathcal{C}$ be a compactly generated pointed ∞-category. Conjecture 6.3.0.7 asserts in particular that the derivatives $\{\partial_n(\mathrm{id}_{\mathcal{C}})\}_{n \geq 1}$ can be regarded as an algebra object in the ∞-category of symmetric sequences $\mathrm{SSeq}(\mathrm{Sp}(\mathcal{C}), \mathrm{Sp}(\mathcal{C}))$. Let us consider the special case where $\mathcal{C} = \mathcal{S}_*$ is the ∞-category of pointed spaces, so that $\mathrm{Sp}(\mathcal{C}) \simeq \mathrm{Sp}$ is the ∞-category of spectra. Let $S \in \mathrm{Sp}(\mathcal{S}_*) \simeq \mathrm{Sp}$ denote the sphere spectrum. Repeatedly applying Corollary 1.4.4.6, we see that each of the functors $\partial_n(\mathrm{id}_{\mathcal{C}})$ is determined by the single object $(\partial_n F)(S, S, \ldots, S) \in \mathrm{Sp}(\mathcal{C})$, which we will denote by $\partial_n(F)$. In the special case where $\mathcal{C} = \mathcal{S}_*$, we can identify each $\partial_n(F)$ with a spectrum, so that $\{\partial_n(F)\}_{n \geq 1}$ can be viewed as a symmetric sequence of spectra.

Let $\mathrm{id} : \mathcal{S}_* \to \mathcal{S}_*$ be the identity functor. Conjecture 6.3.0.7 implies in particular that $\{\partial_n(\mathrm{id})\}_{n \geq 1}$ can be regarded as an algebra with respect to the composition product on symmetric sequences of spectra. In other words, it implies that can regard $\{\partial_n(\mathrm{id})\}_{n \geq 1}$ as an *operad* in the category of spectra, in that it is equipped with composition maps

$$\partial_m(\mathrm{id}) \otimes \partial_{n_1}(\mathrm{id}) \otimes \cdots \otimes \partial_{n_m}(\mathrm{id}) \to \partial_{n_1 + \cdots + n_m}(\mathrm{id})$$

satisfying suitable associative laws. A structure of this type was constructed by Ching, who showed that $\{\partial_n(\mathrm{id})\}_{n \geq 1}$ can be regarded as a homotopy-theoretic analogue of the Lie operad (see [29]). Ching's work built upon earlier results of Arone and Mahowald, who gave an explicit description of the spectra $\partial_n(\mathrm{id})$ as the Spanier-Whitehead dual of a certain partition complex. To recall their result, we need to introduce a bit of notation.

Definition 6.3.3.1. Let I be a nonempty finite set. We let $\mathrm{Equiv}(I)$ denote the collection of all equivalence relations on I. We will regard $\mathrm{Equiv}(I)$ as a partially ordered set, where $E \leq E'$ if xEy implies $xE'y$.

We let $E_\top$ denote the trivial equivalence relation on I (so that $xE_\top y$ for all $x, y \in S$) and $E_\perp$ the discrete equivalence relation on I (so that $xE_\perp y$ if and only if $x = y$). Then $E_\top$ and $E_\perp$ are the greatest and smallest elements of $\mathrm{Equiv}(I)$, respectively. We set

$$\mathrm{Equiv}^+(I) = \mathrm{Equiv}(I) - \{E_\top\} \qquad \mathrm{Equiv}^-(I) = \mathrm{Equiv}(I) - \{E_\perp\}$$

小红书
小红书号:3189205503 qq

$$\mathrm{Equiv}^{\pm}(I) = \mathrm{Equiv}^{+}(I) \cap \mathrm{Equiv}^{-}(I) = \mathrm{Equiv}(I) - \{E_{\top}, E_{\bot}\}.$$

Notation 6.3.3.2. Let $S \in \mathrm{Sp}$ denote the sphere spectrum. Since the ∞-category Sp^{op} admits small colimits, Theorem HTT.5.1.5.6 implies that there is an essentially unique functor $F : \mathcal{S} \to \mathrm{Sp}^{op}$ which preserves small colimits and satisfies $F(*) = S$. If X is a space, we will denote the spectrum $F(X)$by S^X, and refer to it as the *Spanier-Whitehead dual* of X.

More generally, if K is any simplicial set, we let S^K denote the Spanier-Whitehead dual of a fibrant replacement for K.

Theorem 6.3.3.3 (Arone-Mahowald)**.** *Let $n \geq 1$ be a positive integer and set $I = \{1, \ldots, n\}$. Then there is a fiber sequence of spectra*

$$\partial_n(\mathrm{id}) \to S^{\mathrm{N}(\mathrm{Equiv}(I))} \to S^{\mathrm{N}(\mathrm{Equiv}^{+}(I))} \times_{S^{\mathrm{N}(\mathrm{Equiv}^{\pm}(I))}} S^{\mathrm{N}(\mathrm{Equiv}^{-}(I))}.$$

Remark 6.3.3.4. The fiber sequence of Theorem 6.3.3.3 is equivariant with respect to the action of the symmetric group Σ_n.

Remark 6.3.3.5. If $n = 1$, then the partially ordered sets $\mathrm{Equiv}^{+}(I)$, $\mathrm{Equiv}^{-}(I)$, and $\mathrm{Equiv}^{\pm}(I)$ are empty. In this case, Theorem 6.3.3.3 asserts the existence of an equivalence $\partial_1(\mathrm{id}) \simeq S$, which can be deduced directly from Example 6.2.1.4. If $n > 1$, then the simplicial sets $\mathrm{N}(\mathrm{Equiv}(I))$, $\mathrm{N}(\mathrm{Equiv}^{+}(I))$, and $\mathrm{N}(\mathrm{Equiv}^{-}(I))$ are weakly contractible. In this case, Theorem 6.3.3.3 asserts the existence of an equivalence

$$\partial_n(\mathrm{id}) \to \Omega \, \mathrm{fib}(S \to S^{\mathrm{N}(\mathrm{Equiv}^{\pm}(I))}).$$

For the original proof of Theorem 6.3.3.3, we refer the reader to [3]. In this section, we will give a rather different proof which is based on the exactness properties of the construction $F \mapsto \vec{\partial}(F)$, where $F : \mathcal{C}_1 \times \cdots \times \mathcal{C}_n \to \mathcal{D}$ is a functor of several variables. Recall that the differential of F is given by $P_{\vec{1}} \mathrm{cored}(F)$, where $\mathrm{cored}(F)$ denotes the coreduction of F (Construction 6.2.3.6) and $\vec{1} = (1, \ldots, 1)$ (see Example 6.2.3.5). The construction $F \mapsto P_{\vec{1}} F$ is preserves finite limits (Theorem 6.1.1.10), but the formation of coreductions generally does not. The key to our proof of Theorem 6.3.3.3 will be to show that, nevertheless, the construction $F \mapsto \vec{\partial} F$ commutes with certain very special finite limits. Before we can formulate a precise result, we need to introduce some notation.

Notation 6.3.3.6. Let $\mathcal{C}$ be a pointed ∞-category which admits finite limits, let K be a finite simplicial set, and let $U : K^{\triangleleft} \to \mathcal{C}$ be a diagram. Let v denote the cone point of $K^{\triangleleft}$. We let $\mathrm{tfib}(U)$ denote the fiber of the induced map

$$U(v) \to \varprojlim(U|K).$$

We will refer to $\mathrm{tfib}(U)$ as the *total fiber* of the diagram U.

Remark 6.3.3.7. In the situation of Notation 6.3.3.6, if U is a limit diagram, then $\mathrm{tfib}(U)$ is a final object of $\mathcal{C}$. The converse holds if the ∞-category $\mathcal{C}$ is stable.

小红书
小红书号:3189205503 qq

Remark 6.3.3.8. Let $\mathcal{C}$ and $\mathcal{D}$ be pointed ∞-categories which admit finite limits, and let $F : \mathcal{C} \to \mathcal{D}$ be a functor which preserves zero objects. For every finite diagram $U : K^{\triangleleft} \to \mathcal{C}$, there is a canonical map $F(\mathrm{tfib}(U)) \to \mathrm{tfib}(F \circ U)$. If F is left exact, then this map is an equivalence.

Remark 6.3.3.9. Let $\{\mathcal{C}_s\}_{s \in S}$ be a finite collection of pointed ∞-categories which admit finite limits, let $\{K_s\}_{s \in S}$ be a finite collection of finite simplicial sets, and suppose we are given diagrams $U_s : K_s^{\triangleleft} \to \mathcal{C}_s$. Let $\mathcal{D}$ be a pointed ∞-category which admits finite limits, and let $G : \prod_{s \in S} \mathcal{C}_s \to \mathcal{D}$ be a functor which is left exact in each variable. Then $G(\{\mathrm{tfib}(U_s)\}_{s \in S})$ can be identified with the total fiber of the diagram

$$\prod_{s \in S} K_s^{\triangleleft} \overset{\prod U_s}{\to} \prod_{s \in S} \mathcal{C}_s \overset{G}{\to} \mathcal{D}\,.$$

Example 6.3.3.10. In the situation of Notation 6.3.3.6, suppose that $K = \Delta^0$, so that a map $U : K^{\triangleleft} \to \mathcal{C}$ can be identified with a morphism f in $\mathcal{C}$. We then have a canonical equivalence $\mathrm{tfib}(U) \simeq \mathrm{fib}(f)$.

Example 6.3.3.11. Let $\{\mathcal{C}_s\}_{s \in S}$ be a finite collection of ∞-categories which admit final objects, let $\mathcal{D}$ be a pointed ∞-category which admits finite limits, and let $F : \prod_{s \in S} \mathcal{C}_s \to \mathcal{D}$ be a functor. Then the reduction $\mathrm{Red}(F)$ introduced in Construction 6.1.3.15 is given by the total fiber of the diagram of functors $\{F^T\}_{T \subseteq S}$.

Our next goal is to construct a variant of Example 6.3.3.11. More precisely, we will show that if $F : \prod_{s \in S} \mathcal{C}_s \to \mathcal{D}$ is a functor which carries final objects of $\prod_{s \in S} \mathcal{C}_s$ to final objects of $\mathcal{D}$, then the reduction $\mathrm{Red}(F)$ has a different description as the total fiber of a diagram of functors (which is better behaved with respect to differentiation).

Construction 6.3.3.12. Let $\{\mathcal{C}_s\}_{s \in S}$ be a nonempty finite collection of ∞-categories which admit final objects $*_s \in \mathcal{C}_s$. Let $F : \prod_{s \in S} \mathcal{C}_s \to \mathcal{D}$ be a functor, where $\mathcal{D}$ is an ∞-category which admits finite products. For every equivalence relation E on the set S, we let $F^E : \prod_{s \in S} \mathcal{C}_s \to \mathcal{D}$ denote the functor given by the formula

$$F^E(\{X_s\}_{s \in S}) = \prod_{T \in S/E} F(\{X_s^T\}_{s \in S})$$

where

$$X_s^T = \begin{cases} X_s & \text{if } s \in T \\ *_s & \text{if } s \notin T. \end{cases}$$

It will be convenient to have a more formal construction of the collection of functors $\{F^E\}_{E \in \mathrm{Equiv}(S)}$. For this, we define a partially ordered set $\overline{\mathrm{Equiv}(S)}$ as follows:

(*a*) The objects of $\overline{\mathrm{Equiv}}(S)$ are pairs (T, E), where $T \subseteq S$ and E is an equivalence relation on T.

小红书
小红书号:3189205503 qq

(*b*) We have $(T, E) \leq (T', E')$ if and only if $T \subseteq T'$ and xEy implies $xE'y$ for $x, y \in T$.

Let us identify $\mathrm{Equiv}(S)$ with the partially ordered subset of $\overline{\mathrm{Equiv}}(S)$ consisting of those pairs (T, E) where $T = S$, and let $\overline{\mathrm{Equiv}}_0(S)$ denote the subset of $\overline{\mathrm{Equiv}}(S)$ consisting of those pairs (T, E) where E is a trivial equivalence relation on T.

Now let $F : \prod_{s \in S} \mathcal{C}_s \to \mathcal{D}$ be as above, and for $T \subseteq S$ let F^T be the functor defined in Construction 6.1.3.15. The construction $(T, E) \mapsto F^{S-T}$ determines a functor $\mathrm{N}(\overline{\mathrm{Equiv}}_0(S))^{op} \to \mathrm{Fun}(\prod_s \mathcal{C}_s, \mathcal{D})$. This functor admits a right Kan extension $\mathrm{N}(\overline{\mathrm{Equiv}}(S))^{op} \to \mathrm{Fun}(\prod_s \mathcal{C}_s, \mathcal{D})$, which we will denote by $(T, E) \mapsto F^{(T,E)}$. When $T = S$, we will denote $F^{(T,E)}$ simply by F^E. Note that $F^E \simeq \prod_{T \in S/E} F^T$ agrees with the functor defined informally above.

Proposition 6.3.3.13. *Let S be a nonempty finite set, let $F : \prod_{s \in S} \mathcal{C}_s \to \mathcal{D}$ be a functor between ∞-categories. Assume that each $\mathcal{C}_s$ has a final object $*_s$, that $\mathcal{D}$ is pointed and admits finite limits, and that $F(\{*_s\})$ is a final object of $\mathcal{D}$. Let H denote the total fiber of the diagram $\{F^E\}_{E \in \mathrm{Equiv}(S)}$. Then:*

(*a*) *The functor $H : \prod_{s \in S} \mathcal{C}_s \to \mathcal{D}$ is reduced.*

(*b*) *Let $G : \prod_{s \in S} \mathcal{C}_s \to \mathcal{D}$ be any reduced functor. Then the canonical map $H \to F^{E_\top} \simeq F$ induces a homotopy equivalence*

$$\mathrm{Map}_{\mathrm{Fun}(\prod_{s \in S} \mathcal{C}_s, \mathcal{D})}(G, H) \to \mathrm{Map}_{\mathrm{Fun}(\prod_{s \in S} \mathcal{C}_s, \mathcal{D})}(G, F).$$

Consequently, we have a canonical equivalence $H \simeq \mathrm{Red}(F)$.

Proof. We first prove (*a*). We will assume that S has more than one element (otherwise $H = F$ and the result is obvious). Fix an element $t \in S$, and choose a sequence of objects $\{X_s \in \mathcal{C}_s\}$ such that $X_t = *_t$. We will prove that the canonical map $F(\{X_s\}) \to \varprojlim_{E \in \mathrm{Equiv}^+(S)} F^E(\{X_s\})$ is an equivalence. Let $U \subseteq \mathrm{Equiv}(S)$ denote the subset consisting of those equivalence relations E on S such that, if sEt, then $s = t$ (that is, the set $\{t\}$ is an equivalence class with respect to E). Note that the inclusion $\mathrm{N}(U) \to \mathrm{N}(\mathrm{Equiv}(S))$ admits a right adjoint, which we will denote by $E \mapsto E'$. Using our assumption that $X_t = *_t$ and that $F(\{*_s\})$ is a final object of $\mathcal{D}$, we deduce that the canonical map $F^E(\{X_s\}) \to F^{E'}(\{X_s\})$ is an equivalence for every equivalence relation $E \in \mathrm{Equiv}(S)$. Let $U^+ = U \cap \mathrm{Equiv}^+(S)$. The preceding argument shows that the diagram $\{F^E(\{X_s\})\}_{E \in \mathrm{Equiv}^+(S)}$ is a right Kan extension of its restriction to $\{F^E(\{X_s\})\}_{E \in U^+}$. Note that U^+ has a largest element (given by the equivalence E_0 relation corresponding to the partition $S = \{t\} \cup (S - \{t\})$), so that $\varprojlim_{E \in \mathrm{Equiv}^+(S)} F^E(\{X_s\})$ is given by $F^{E_0}(\{X_s\})$. It now suffices to observe that the map $F(\{X_s\}) \to F^{E_0}(\{X_s\})$ is an equivalence.

To prove (*b*), it will suffice to show that the space

$$\mathrm{Map}_{\mathrm{Fun}(\prod_{s \in S} \mathcal{C}_s, \mathcal{D})}(G, \varprojlim_{E \in \mathrm{Equiv}^+(S)} F^E)$$

小红书
小红书号:3189205503 qq

is contractible. In fact, we claim that the mapping space

$$\mathrm{Map}_{\mathrm{Fun}(\prod_{s\in S} \mathcal{C}_s, \mathcal{D})}(G, F^E)$$

is contractible for every nontrivial equivalence relation E on S. Let $S_1, \ldots, S_k$ denote the equivalence classes with respect to $\sim$, so that $F^E = \prod_{1 \leq i \leq k} F^{S_i}$ (where F^{S_i} is defined as in Construction 6.1.3.15). It will therefore suffice to show that each of the mapping spaces $\mathrm{Map}_{\mathrm{Fun}(\prod_{s\in S} \mathcal{C}_s, \mathcal{D})}(G, F^{S_i})$ is contractible. Let $\mathcal{E} \subseteq \prod_{s \in S} \mathcal{C}_s$ be the full subcategory spanned by those sequences $\{Y_s\}_{s \in S}$ such that Y_s is a final object of $\mathcal{C}_s$ for $s \notin S_i$. Then F^{S_i} is a right Kan extension of its restriction to $\mathcal{E}$. It will therefore suffice to show that $\mathrm{Map}_{\mathrm{Fun}(\mathcal{E}, \mathcal{D})}(G|\,\mathcal{E}, F^{S_i}|\,\mathcal{E})$ is contractible. This is clear, since G carries each object of $\mathcal{E}$ to a zero object of $\mathcal{D}$. □

The main ingredient in our proof of Theorem 6.3.3.3 is the following assertion:

Theorem 6.3.3.14. *Let $\{\mathcal{C}_s\}_{s \in S}$ be a nonempty finite collection of pointed ∞-categories which admit finite colimits. For each functor $F : \prod_{s \in S} \mathcal{C}_s \to \mathcal{S}_*$, let DF denote a differential of F (see Definition 6.2.3.1 and Proposition 6.2.3.13). Suppose that $F : \prod_{s \in S} \mathcal{C}_s \to \mathcal{S}_*$ is a functor such that $F(\{*_s\})$ is contractible, so that Proposition 6.3.3.13 furnishes an equivalence $\theta : \mathrm{Red}(F) \simeq \mathrm{tfib}\{F^E\}_{E \in \mathrm{Equiv}(S)}$. Then θ induces an equivalence $D\,\mathrm{Red}(F) \simeq \mathrm{tfib}\{DF^E\}_{E \in \mathrm{Equiv}(S)}$.*

Example 6.3.3.15. In the situation of Theorem 6.3.3.14, suppose that $S = \{0, 1\}$ and let $*$ denote the zero object of both $\mathcal{C}_0$ and $\mathcal{C}_1$. Theorem 6.3.3.14 asserts that, if $F : \mathcal{C}_0 \times \mathcal{C}_1 \to \mathcal{S}_*$ is a functor such that $F(*, *)$ is contractible and we define $G : \mathcal{C}_0 \times \mathcal{C}_1 \to \mathcal{S}_*$ by the formula $G(C, D) = F(C, *) \times F(*, D)$, then the fiber sequence

$$\mathrm{Red}(F) \to F \to G$$

induces a fiber sequence of differentials

$$D\,\mathrm{Red}(F) \to DF \to DG.$$

Combining Theorem 6.3.3.14 with Corollary 6.2.3.22, we obtain the following result:

Corollary 6.3.3.16. *Let $\{\mathcal{C}_s\}_{s \in S}$ be a nonempty finite collection of pointed differentiable ∞-categories which admit finite colimits, and let $F : \prod_{s \in S} \mathcal{C}_s \to \mathcal{S}_*$ be a functor which preserves final objects and sequential colimits. Then the equivalence $\mathrm{Red}(F) \simeq \mathrm{tfib}\{F^E\}_{E \in \mathrm{Equiv}(S)}$ induces an equivalence $\vec{\partial}\,\mathrm{Red}(F) \simeq \mathrm{tfib}\{\vec{\partial} F^E\}_{E \in \mathrm{Equiv}(S)}$ of functors from $\prod_{s \in S} \mathrm{Sp}(\mathcal{C}_s)$ to $\mathrm{Sp}(\mathcal{D})$.*

The proof of Theorem 6.3.3.14 is rather elaborate, and will be given in §6.3.4. We conclude this section by showing how Theorem 6.3.3.3 can be deduced from Theorem 6.3.3.14.

Proof of Theorem 6.3.3.3. Let $\mathrm{id} : \mathcal{S}_* \to \mathcal{S}_*$ be the identity functor; we wish to describe the spectrum $\partial_n(\mathrm{id})$ or equivalently the functor $\partial_n(\mathrm{id}) : \mathrm{Sp}^n \to \mathrm{Sp}$. Let $F : \mathcal{S}_*^n \to \mathcal{S}_*$ be the functor

小红书
小红书号:3189205503 qq

given by $F(X_1, \ldots, X_n) = X_1 \amalg \cdots \amalg X_n$, so that the functor $\partial_n(\mathrm{id})$ is given by the derivative of $\mathrm{Red}(F)$. Set $T = \{1, \ldots, n\}$. Using Corollary 6.3.3.16, we obtain an equivalence of functors $\alpha : \partial_n(\mathrm{id}) \simeq \mathrm{tfib}\{\vec{\partial}(F^E)\}_{E \in \mathrm{Equiv}(T)}$. Since the product functor on $\mathcal{S}_*$ preserves pushouts in each variable, it follows from Example 6.2.3.10 that $\mathrm{cored}(F^E)$ is trivial for $E \neq E_\perp$. Moreover, $F^{E_\perp}$ is given by the formula $F^{E_\perp}(X_1, \ldots, X_n) = X_1 \times \cdots \times X_n$, so that $\mathrm{cored}(F^{E_\perp})$ is the iterated smash product functor $\wedge : \mathcal{S}_*^n \to \mathcal{S}_*$ and therefore $\vec{\partial}(F^{E_\perp}) : \mathrm{Sp}^n \to \mathrm{Sp}$ is also given by the iterated smash product (see Example 6.2.3.28). In particular, we have $\vec{\partial}(F^E)(S, S, \ldots, S) \simeq G'(E)$, where $G' : \mathrm{N}(\mathrm{Equiv}(T))^{op} \to \mathrm{Sp}$ denote the functor given by the formula

$$G'(E) = \begin{cases} S & \text{if } E = E_\perp \\ 0 & \text{otherwise.} \end{cases}$$

Evaluating α on the sphere spectrum, we obtain an equivalence of spectra $\partial_n(\mathrm{id}) \simeq \mathrm{tfib}(G')$.

Let $G : \mathrm{N}(\mathrm{Equiv}(T))^{op} \to \mathrm{Sp}$ be the constant functor taking the value S, and let $G'' : \mathrm{N}(\mathrm{Equiv}(T))^{op} \to \mathrm{Sp}$ be given by $G''(E) = \begin{cases} 0 & \text{if } E = E_\perp \\ S & \text{otherwise.} \end{cases}$ so that we have a fiber sequence of functors

$$G' \to G \to G''$$

and therefore a fiber sequence of spectra

$$\partial_n(\mathrm{id}) \to \mathrm{tfib}(G) \to \mathrm{tfib}(G'').$$

Unwinding the definitions, we have equivalences

$$\mathrm{tfib}(G) = \mathrm{fib}(\varprojlim(G) \to \varprojlim(G|\,\mathrm{N}(\mathrm{Equiv}^+(T))) \qquad \mathrm{tfib}(G'') = \mathrm{fib}(\varprojlim(G'') \to \varprojlim(G''|\,\mathrm{N}(\mathrm{Equiv}^+(T))).$$

Note that G'' is a right Kan extension of $G|\,\mathrm{N}(\mathrm{Equiv}^-(T))$, so that

$$\mathrm{tfib}(G'') \simeq \mathrm{fib}(\varprojlim(G|\,\mathrm{N}(\mathrm{Equiv}^-(T))) \to \varprojlim(G|\,\mathrm{N}(\mathrm{Equiv}^{\pm}(T))).$$

We may therefore identify $\partial_n(\mathrm{id})$ with the total fiber of the diagram of spectra

$$\begin{array}{ccc} \varprojlim(G) & \longrightarrow & \varprojlim(G|\,\mathrm{N}(\mathrm{Equiv}^+(T))) \\ \downarrow & & \downarrow \\ \varprojlim(G|\,\mathrm{N}(\mathrm{Equiv}^-(T))) & \longrightarrow & \varprojlim(G|\,\mathrm{N}(\mathrm{Equiv}^{\pm}(T))), \end{array}$$

which is the fiber of the canonical map

$$S^{\mathrm{N}(\mathrm{Equiv}(T))} \to S^{\mathrm{N}(\mathrm{Equiv}^+(T))} \times_{S^{\mathrm{N}(\mathrm{Equiv}^{\pm}(T))}} S^{\mathrm{N}(\mathrm{Equiv}^-(T))}.$$

□

小红书号:3189205503 qq

6.3.4 Differentiation and Reduction

Let $\{\mathcal{C}_s\}_{s \in S}$ be a nonempty finite collection of pointed ∞-categories which admit finite colimits, and let $F : \prod_{s \in S} \mathcal{C}_s \to \mathcal{S}_*$ be a functor which preserves final objects. Our goal in this section is to prove Theorem 6.3.3.14, which asserts that the canonical map

$$d\,\mathrm{Red}(F) \to \mathrm{tfib}\{dF^E\}_{E \in \mathrm{Equiv}(S)}$$

is an equivalence of functors from $\prod_{s \in S} \mathcal{C}_s \to \mathcal{S}_*$ (here dG denotes the differential of a functor G). We can outline our strategy as follows:

(a) Let $\mathcal{C} = \prod_{s \in S} \mathcal{C}_s$. We will show that any functor $F : \mathcal{C} \to \mathcal{S}_*$ can be "approximated" by products of homogeneous functors (Proposition 6.3.4.4).

(b) We show that any homogeneous functor from $\mathcal{C}$ to $\mathcal{D}$ is a product of functors which are homogeneous in each variable (Proposition 6.3.4.11).

(c) Using (a) and (b), we are reduced to proving Theorem 6.3.3.14 for (products of) functors which are homogeneous in each variable. In this case, we will obtain the desired result by combining the classification of homogeneous functors given in §6.1.4 with an analysis of the partially ordered set $\mathrm{Equiv}(S)$ of equivalence relations on S.

To carry out step (a), we need to introduce some terminology.

Definition 6.3.4.1. Let $\mathcal{C}$ be an ∞-category which admits finite colimits and has a final object and let $\mathcal{D}$ be a differentiable ∞-category. We will say that a natural transformation $\alpha : F \to G$ of functors $F, G : \mathcal{C} \to \mathcal{D}$ is a *jet equivalence* if α induces an equivalence $P_n F \to P_n G$ for every integer n.

Remark 6.3.4.2. Let $\mathcal{C}$ be an ∞-category which admits finite colimits and has a final object, let $\mathcal{D}$ be a differentiable ∞-category, and suppose we are given a pullback diagram

$$\begin{array}{ccc} F & \xrightarrow{\alpha} & F' \\ \downarrow & & \downarrow \\ G & \xrightarrow{\beta} & G' \end{array}$$

in the ∞-category $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$. If β is a jet equivalence, then α is also a jet equivalence. This follows from the fact that each of the functors $P_n : \mathrm{Fun}(\mathcal{C}, \mathcal{D}) \to \mathrm{Fun}(\mathcal{C}, \mathcal{D})$ is left exact (Remark 6.1.1.29).

Remark 6.3.4.3. Let $\mathcal{C}$ be an ∞-category which admits finite colimits and has a final object and let $\mathcal{D}$ be a differentiable ∞-category. Assume that $\mathcal{D}$ admits K-indexed colimits, for some simplicial set K. Then the collection of jet equivalences is closed under K-indexed colimits (when regarded as a full subcategory of $\mathrm{Fun}(\Delta^1, \mathrm{Fun}(\mathcal{C}, \mathcal{D}))$). This follows immediately from the observation that $P_n : \mathrm{Fun}(\mathcal{C}, \mathcal{D}) \to \mathrm{Fun}(\mathcal{C}, \mathcal{D})$ is a localization functor.

小红书号:3189205503 qq

The main ingredient in our proof of Theorem 6.3.3.14 is the following general approximation result:

Proposition 6.3.4.4. *Let $\mathcal{C}$ be an ∞-category which admits finite colimits and has a final object, let $F : \mathcal{C} \to \mathcal{S}_*$ be a reduced functor, and let $n \geq 0$ be an integer. Then there exists a simplicial object $F_\bullet$ of $\mathrm{Fun}(\mathcal{C}, \mathcal{S}_*)$ and a jet equivalence $\alpha : |F_\bullet| \to P_n F$ satisfying the following condition:*

($*_n$) *For each integer $p \geq 0$, the functor F_p can be written as a finite product $F_p \simeq \prod_\alpha F_{p,\alpha}$, each each $F_{p,\alpha} : \mathcal{C} \to \mathcal{S}_*$ is k_α-homogeneous for some $1 \leq k_\alpha \leq n$.*

The proof of Proposition 6.3.4.4 will require some preliminaries.

Lemma 6.3.4.5. *Let $\mathcal{C}$ be an ∞-category which admits finite colimits and has a final object, let $\mathcal{D}$ be a pointed differentiable ∞-category, and let $\alpha : F \to G$ be a natural transformation between functors $F, G : \mathcal{C} \to \mathcal{D}$. Assume that:*

(*i*) *The map α induces an equivalence $F(*) \to G(*)$, where $*$ denotes the final object of $\mathcal{C}$.*

(*ii*) *There exists an integer k such that α induces an equivalence of functors $\Omega^k(F) \to \Omega^k(G)$.*

Then α is a jet equivalence.

Proof. We will prove that $P_n(\alpha)$ is an equivalence using induction on n. If $n = 0$, the desired result follows from (*i*). If $n > 0$, we use Theorem 6.1.2.4 to construct a map of fiber sequences

$$\begin{array}{ccccc} P_n F & \longrightarrow & P_{n-1} F & \longrightarrow & RF \\ \downarrow{\scriptstyle P_n(\alpha)} & & \downarrow{\scriptstyle P_{n-1}(\alpha)} & & \downarrow{\scriptstyle R(\alpha)} \\ P_n G & \longrightarrow & P_{n-1} G & \longrightarrow & RG. \end{array}$$

Since $P_{n-1}(\alpha)$ is an equivalence by the inductive hypothesis, it will suffice to show that $R(\alpha)$ is an equivalence. Because the functor R is left exact, condition (*ii*) implies that $R(\alpha)$ induces an equivalence $\Omega^k RF \to \Omega^k RG$ for some integer k. Since the ∞-category $\mathrm{Homog}^n(\mathcal{C}, \mathcal{D})$ is stable (Corollary 6.1.2.8), this implies that $R(\alpha)$ is itself an equivalence. □

Lemma 6.3.4.6. *Let $\mathcal{C}$ be an ∞-category which admits finite colimits and has a final object. Let $n \geq 0$, and let $U : \mathrm{Fun}(\mathrm{N}(\mathbf{\Delta})^{op}, \mathrm{Fun}_*(\mathcal{C}, \mathcal{S}_*)) \to \mathrm{Fun}_*(\mathcal{C}, \mathcal{S}_*)$ be the functor given by the formula $U(F_\bullet) = P_n |F_\bullet|$. Then U preserves finite limits.*

Proof. Since it is clear that U preserves final objects, it will suffice to show that U preserves pullback squares (Corollary HTT.4.4.2.5). Let $\tau_{\geq 1} : \mathcal{S}_* \to \mathcal{S}_*$ be the functor which assigns to each pointed space X the connected component of its base point (so that we have a fiber sequence $\tau_{\geq 1} X \to X \to \pi_0 X$). For every functor $F : \mathcal{C} \to \mathcal{S}_*$, let F^{o} denote the composite functor

$$\mathcal{C} \xrightarrow{F} \mathcal{S}_* \xrightarrow{\tau_{\geq 1}} \mathcal{S}_* .$$

小红书
小红书号:3189205503 qq

There is an evident natural transformation $F^{\circ} \to F$. According to Lemma 6.3.4.5, this natural transformation is a jet equivalence whenever F is reduced (or, more generally, whenever F carries the final object of $\mathcal{C}$ to a connected space). If we are given a simplicial object $F_{\bullet}$ in $\mathrm{Fun}_*(\mathcal{C}, \mathcal{D})$, then we obtain a new simplicial object $F^{\circ}_{\bullet}$, and Remark 6.3.4.3 implies that the induced map $|F^{\circ}_{\bullet}| \to |F_{\bullet}|$ is also a jet equivalence, and therefore induces an equivalence $U(F^{\circ}_{\bullet}) \to U(F_{\bullet})$.

Suppose now that we are given a pullback diagram σ :

$$\begin{array}{ccc} F_{\bullet} & \longrightarrow & F'_{\bullet} \\ \downarrow & & \downarrow \\ G_{\bullet} & \longrightarrow & G'_{\bullet} \end{array}$$

of simplicial objects of $\mathrm{Fun}_*(\mathcal{C}, \mathcal{D})$. We would like to show that $U(\sigma)$ is also a pullback diagram. In view of the above arguments, it will suffice to show that U carries the diagram σ':

$$\begin{array}{ccc} F^{\circ}_{\bullet} & \longrightarrow & F'^{\circ}_{\bullet} \\ \downarrow & & \downarrow \\ G^{\circ}_{\bullet} & \longrightarrow & G'^{\circ}_{\bullet}. \end{array}$$

to a pullback diagram in $\mathrm{Fun}_*(\mathcal{C}, \mathcal{S}_*)$. Let $H_{\bullet}$ be the simplicial functor given by the fiber product $F'^{\circ}_{\bullet} \times_{G'^{\circ}_{\bullet}} G^{\circ}_{\bullet}$. For every integer $k \geq 0$ and every object $X \in \mathcal{C}$, we have a pullback diagram

$$\begin{array}{ccc} F^{\circ}_k(X) & \longrightarrow & H_k(X) \\ \downarrow & & \downarrow \\ \pi_0 F_k(X) & \longrightarrow & \pi_0 F'_k(X) \times_{\pi_0 G'_k(X)} \pi_0 G_k(X) \end{array} ,$$

so that the canonical map $F^{\circ}_k(X) \to H_k(X)$ has nonempty, discrete homotopy fibers (that is, it is a covering map). Using Lemma 6.3.4.5, we deduce that the map $F^{\circ}_k \to H_k$ is a jet equivalence, so that Remark 6.3.4.3 implies that $U(F^{\circ}_{\bullet}) \to U(H_{\bullet})$ is an equivalence. It will therefore suffice to show that the pullback diagram

$$\begin{array}{ccc} H_{\bullet} & \longrightarrow & F'^{\circ}_{\bullet} \\ \downarrow & & \downarrow \\ G^{\circ}_{\bullet} & \longrightarrow & G'^{\circ}_{\bullet} \end{array}$$

remains a pullback diagram after applying the functor U. Because P_n is left exact (Remark 6.1.1.29), we are reduced to proving that the diagram

$$\begin{array}{ccc} |H_{\bullet}| & \longrightarrow & |F'^{\circ}_{\bullet}| \\ \downarrow & & \downarrow \\ |G^{\circ}_{\bullet}| & \longrightarrow & |G'^{\circ}_{\bullet}| \end{array}$$

小红书
小红书号:3189205503 qq

is a pullback square of functors. This is equivalent to the assertion that for every object $X \in \mathcal{C}$, the diagram

$$\begin{array}{ccc} |H_\bullet(X)| & \longrightarrow & |F'^{o}_\bullet(X)| \\ \downarrow & & \downarrow \\ |G^{o}_\bullet(X)| & \longrightarrow & |G'^{o}_\bullet(X)| \end{array}$$

is a pullback square of spaces. This follows from Lemma 5.5.6.17 (note that each $G'^{o}_k(X)$ is connected, by construction). □

Proof of Proposition 6.3.4.4. Let $G : \mathcal{C} \to \mathcal{S}_*$ denote the constant functor taking the value Δ^0, and let $G_\bullet$ be the constant simplicial object of $\mathrm{Fun}(\mathcal{C}, \mathcal{S}_*)$ taking the value G. We proceed by induction on n. When $n = 0$, we can take $F_\bullet = G_\bullet$. Let us therefore assume that $n > 0$. By the inductive hypothesis, we can choose a jet equivalence $\alpha : |F_\bullet| \to P_{n-1}F$ satisfying condition $(*_{n-1})$. Choose a natural transformation $u : G_\bullet \to F_\bullet$, and let $F_{\bullet,\bullet}$ be the Čech nerve of u. For every integer $p \geq 0$, we have an augmentation map

$$v_p : \varinjlim_{[q]} F_{p,q} \to F_p$$

which exhibits $\varinjlim_{[q]} F_{p,q}(X)$ as the base point component of $F_p(X)$, for every object $X \in \mathcal{C}$. Using Lemma 6.3.4.5, we deduce that v_p is a jet equivalence. It follows that the composite map

$$P_m(\varinjlim_{[p],[q]} F_{p,q}) \to P_m|F_\bullet| \simeq P_{n-1}F$$

is also a jet equivalence. Define a simplicial object $F'_\bullet$ of $\mathrm{Fun}(\mathcal{C}, \mathcal{S}_*)$ by the formula $F'_p = F_{p,p}$. Since the ∞-category $\mathrm{N}(\mathbf{\Delta})^{op}$ is sifted, we conclude that the map $|F'_\bullet| \to P_{n-1}F$ is a jet equivalence.

Theorem 6.1.2.4 supplies a fiber sequence of functors

$$P_nF \to P_{n-1}F \to RF,$$

where R is n-homogeneous, and let $F''_\bullet$ denote the simplicial object of $\mathrm{Fun}(\mathcal{C}, \mathcal{S}_*)$ whose pth term is given by the fiber of the composite map

$$F'_p \to P_{n-1}F \to RF.$$

We claim that the evident map $\beta : |F''_\bullet| \to P_nF$ satisfies our requirements. Since colimits in $\mathcal{S}$ are universal, we have a pullback diagram

$$\begin{array}{ccc} |F''_\bullet| & \longrightarrow & |F'_\bullet| \\ \downarrow{\scriptstyle \beta} & & \downarrow{\scriptstyle \gamma} \\ P_nF & \longrightarrow & P_{n-1}F. \end{array}$$

小红书 小红书号:3189205503 qq

For every integer $p \geq 0$, the map $F'_p \to P_{n-1}F \to R$ factors through $F'_0 \simeq G$ and is therefore nullhomotopic. We therefore have an equivalence

$$F''_p \simeq \Omega(RF) \times F'_p \simeq \Omega(RF) \times F_{p,p} \simeq \Omega(RF) \times \Omega(F_p)^p.$$

Because the simplicial object $F_\bullet$ satisfies $(*_{n-1})$ and R is n-homogeneous, we deduce that $F''_\bullet$ satisfies $(*_n)$. □

To apply Proposition 6.3.4.4 in our context, we need to know something about the classification of homogeneous functors with domain $\prod_{s \in S} \mathcal{C}_s$. For this, we need to generalize some of the results of §6.1.4 to the multivariate case. We begin by proving a generalization of Proposition 6.1.3.10.

Proposition 6.3.4.7. *Let $\{\mathcal{C}_s\}_{s \in S}$ be a nonempty finite collection of pointed ∞-categories which admit finite colimits, let $\mathcal{C} = \prod_{s \in S} \mathcal{C}_s$, and let $\mathcal{D}$ be a pointed differentiable ∞-category. Let $F : \prod_{s \in S} \mathcal{C}_s \to \mathcal{D}$ be a functor which is n_s-reduced in the sth argument. Then F is n-reduced (when regarded as a functor from $\mathcal{C}$ to $\mathcal{D}$.*

Lemma 6.3.4.8. *Let $\mathcal{C}_0$ and $\mathcal{C}_1$ be ∞-categories which admit finite colimits and zero objects $*_0$ and $*_1$, let $\mathcal{C} = \mathcal{C}_0 \times \mathcal{C}_1$, and let $\mathcal{D}$ be an ∞-category which admits finite limits. Let ϕ_0 denote the composite functor*

$$\mathcal{C}_0 \simeq \mathcal{C}_0 \times \{*_1\} \hookrightarrow \mathcal{C}_0 \times \mathcal{C}_1 = \mathcal{C},$$

and define $\phi_1 : \mathcal{C}_1 \to \mathcal{C}$ similarly. Then composition with ϕ_0 and ϕ_1 induces an equivalence of ∞-categories

$$\theta : \mathrm{Exc}_*(\mathcal{C}, \mathcal{D}) \to \mathrm{Exc}_*(\mathcal{C}_0, \mathcal{D}) \times \mathrm{Exc}_*(\mathcal{C}_1, \mathcal{D}).$$

Proof. Let $\xi : \mathrm{Exc}_*(\mathcal{C}_0, \mathcal{D}) \times \mathrm{Exc}_*(\mathcal{C}_1, \mathcal{D}) \to \mathrm{Exc}_*(\mathcal{C}_0 \times \mathcal{C}_1, \mathcal{D})$ be the functor given by the formula

$$\xi(F_0, F_1)(X, Y) = F_0(X) \times F_1(Y).$$

It is easy to see that ξ is a homotopy inverse to θ. □

Remark 6.3.4.9. Let $\{\mathcal{C}_s\}_{s \in S}$ be a nonempty finite collection of pointed ∞-categories which admit finite colimits, let $\mathcal{C} = \prod_{s \in S} \mathcal{C}_s$, let $\mathcal{D}$ be a pointed ∞-category which admits finite products. Let $F : \mathcal{C} \to \mathcal{D}$ be a functor and let $\mathrm{cr}_n(F) : \mathcal{C}^n \to \mathcal{D}$ be its nth cross effect. Let $d\,\mathrm{cr}_n(F)$ denote the differential of $\mathrm{cr}_n(F)$ (where we regard $\mathrm{cr}_n(F)$ as a functor of n variables). The proof of Lemma 6.3.4.8 shows that $d\,\mathrm{cr}_n(F)$ can be written as a product of functors given by the composition

$$\mathcal{C}^n \to \prod_{s \in S} \mathcal{C}_s^{n_s} \xrightarrow{d\,\mathrm{cr}_{\vec{n}}(F)} \mathcal{D}$$

where $\vec{n}$ varies over those tuples $\{n_s\}_{s \in S}$ having sum n and the cross effects $\mathrm{cr}_{\vec{n}}$ are defined as in Variant 6.1.3.21.

小红书
小红书号:3189205503 qq

Proof of Proposition 6.3.4.7. If each $n_s = 0$, there is nothing to prove. Assume therefore that $n_s > 0$ for some $s \in S$. Then F is 1-reduced as a functor of its sth argument, and therefore 1-reduced when regarded as a functor from $\mathcal{C}$ to $\mathcal{D}$. According to Proposition 6.1.3.24, it will suffice to show that for $m < n$, the differential $d\,\mathrm{cr}_m(F)$ vanishes. Using Remark 6.3.4.9, we are reduced to proving that the functor

$$d\,\mathrm{cr}_{\vec{m}}(F) : \prod_{s \in S} \mathcal{C}_s^{m_s} \to \mathcal{D}$$

is trivial for every sequence $\{m_s\}_{s \in S}$ satisfying $\sum_{s \in S} m_s < n$. For such a sequence, we must have $m_s < n_s$ for some s. The desired result now follows by applying Remark 6.1.3.23 to F, regarded as a functor from $\mathcal{C}_s$ to $\mathrm{Fun}(\prod_{t \neq s} \mathcal{C}_t, \mathcal{D})$. □

Corollary 6.3.4.10. *Let $\{\mathcal{C}_s\}_{s \in S}$ be a nonempty finite collection of ∞-categories which admit finite colimits and final objects, and let $\mathcal{D}$ be a pointed differentiable ∞-category. For every collection of nonnegative integers $\vec{n} = \{n_s\}_{s \in S}$, let $\mathrm{Homog}^{\vec{n}}(\prod_{s \in S} \mathcal{C}_s, \mathcal{D})$ denote the full subcategory of $\mathrm{Fun}(\prod_{s \in S} \mathcal{C}_s, \mathcal{D})$ spanned by those functors F which are n_s-homogeneous when regarded as a functor from $\mathcal{C}_s$ to $\mathrm{Fun}(\prod_{t \neq s} \mathcal{C}_t, \mathcal{D})$. Then $\mathrm{Homog}^{\vec{n}}(\prod_{s \in S} \mathcal{C}_s, \mathcal{D}) \subseteq \mathrm{Homog}^n(\mathcal{C}, \mathcal{D})$, where $\mathcal{C} = \prod_{s \in S} \mathcal{C}_s$ and $n = \sum_{s \in S} n_s$.*

Proof. Combine Proposition 6.3.4.7 with Proposition 6.1.3.4. □

In the situation of Corollary 6.3.4.10, the ∞-category $\mathrm{Homog}^n(\mathcal{C}, \mathcal{D})$ can be reconstructed from the ∞-categories $\mathrm{Homog}^{\vec{n}}(\prod_{s \in S} \mathcal{C}_s, \mathcal{D})$ as follows:

Proposition 6.3.4.11. *Let $\{\mathcal{C}_s\}_{s \in S}$ be a nonempty finite collection of pointed ∞-categories which admit finite colimits, let $\mathcal{C} = \prod_{s \in S} \mathcal{C}_s$, let $\mathcal{D}$ be a pointed differentiable ∞-category, and let $n \geq 0$ be an integer. For every collection of nonnegative integers $\vec{n} = \{n_s\}_{s \in S}$, let $|\vec{n}| = \sum_{s \in S} n_s$. Consider the functor*

$$\Phi : \prod_{|\vec{n}| = n} \mathrm{Homog}^{(\vec{n})}(\prod_{s \in S} \mathcal{C}_s, \mathcal{D}) \to \mathrm{Homog}^{(n)}(\mathcal{C}, \mathcal{D})$$

given by

$$\Phi(\{F_{\vec{n}}\}) = \prod_{|\vec{n}| = n} F_{\vec{n}}.$$

Then Φ is an equivalence of ∞-categories.

Lemma 6.3.4.12. *Let S be a finite set. Suppose we are given a finite collection of pointed ∞-categories $\{\mathcal{C}_s\}_{s \in S}$ which admit finite colimits, and let $\mathcal{D}$ be an ∞-category which admits finite limits. Let $\mathcal{C} = \prod_{s \in S} \mathcal{C}_s$, and for each $s \in S$, let $\phi_s : \mathcal{C}_s \to \mathcal{C}$ be the functor given by the product of the identity map $\mathrm{id} : \mathcal{C}_s \to \mathcal{C}_s$ with constant functor $\mathcal{C}_s \to \mathcal{C}_t$ carrying $\mathcal{C}_s$ to a zero object of $\mathcal{C}_t$ for $t \neq s$.*

小红书 小红书号:3189205503 qq

Fix an integer $n \geq 0$. For every collection of nonnegative integers $\vec{n} = \{n_s\}_{s \in S}$, set

$$\mathcal{C}^{\vec{n}} = \prod_{s \in S} \mathcal{C}_s^{n_s} \qquad \mathcal{C}^{(\vec{n})} = \prod_{s \in S} \mathcal{C}_s^{(n_s)},$$

where $\mathcal{C}_s^{(n_s)}$ denotes the n_sth extended power of $\mathcal{C}_s$ (see Notation 6.1.4.1). Let $\mathrm{SymFun}^{\vec{n}}(\mathcal{C}, \mathcal{D})$ denote the ∞-category $\mathrm{Fun}(\mathcal{C}^{(\vec{n})}, \mathcal{D})$, and let $\mathrm{SymFun}^{(\vec{n})}_{\mathrm{lin}}(\mathcal{C}, \mathcal{D})$ denote the full subcategory of $\mathrm{SymFun}^{\vec{n}}(\mathcal{C}, \mathcal{D})$ spanned by those functors for which the underlying functor $\prod_{s \in S} \mathcal{C}_s^{n_s} \to \mathcal{D}$ is 1-homogeneous in each variable. Let $U_{\vec{n}}$ denote the composite map

$$U_{\vec{n}} : \mathcal{C}^{\vec{n}} \to \prod_{s \in S} \mathcal{C}^{(n_s)} \to \mathcal{C}^{(n)}.$$

Then the maps $U_{\vec{n}}$ induce an equivalence of ∞-categories

$$\Psi : \mathrm{SymFun}^n_{\mathrm{lin}}(\mathcal{C}, \mathcal{D}) \to \prod_{|\vec{n}| = n} \mathrm{SymFun}^{\vec{n}}_{\mathrm{lin}}(\mathcal{C}, \mathcal{D}).$$

Proof. Using Lemma 6.3.4.8 repeatedly, we obtain an equivalence of ∞-categories

$$\mathrm{Exc}_*(\mathcal{C}^n, \mathcal{D}) \to \prod_{(s_1, \ldots, s_n) \in S^n} \mathrm{Exc}_*(\prod_{1 \leq i \leq n} \mathcal{C}_{s_i}, \mathcal{D}).$$

The desired result is now obtained by extracting homotopy fixed points with respect to the action of the symmetric group Σ_n on each side. □

Remark 6.3.4.13. Let $\mathcal{C} = \prod_{s \in S} \mathcal{C}_s$ and $\mathcal{D}$ be as in Lemma 6.3.4.12, and assume that $\mathcal{D}$ is pointed. Let $F : \mathcal{C} \to \mathcal{D}$ be a functor. For every $\vec{n} = \{n_s\}_{s \in S}$ with $\sum_{s \in S} n_s = n$, we let $\mathrm{cr}_{(\vec{n})}(F) \in \mathrm{SymFun}^{(\vec{n})}(\mathcal{C}, \mathcal{D})$ be the composition of $\mathrm{cr}_{(n)}(F) \in \mathrm{SymFun}^{(n)}(\mathcal{C}, \mathcal{D})$ with the functor $U_{\vec{n}} : \mathcal{C}^{(\vec{n})} \to \mathcal{C}^{(n)}$ in the statement of Lemma 6.3.4.12. Note that the underlying n-ary functor of $\mathrm{cr}_{(\vec{n})}(F)$ is given by the functor $\mathrm{cr}_{\vec{n}}(F) : \prod_{s \in S} \mathcal{C}_s^{n_s} \to \mathcal{D}$ appearing in Variant 6.1.3.21.

Proof of Proposition 6.3.4.11. Suppose we are given two sequences $\vec{m}$ and $\vec{n}$ with $|\vec{m}| = |\vec{n}| = n$. Consider the composite functor

$$U_{\vec{m}, \vec{n}} : \mathrm{Homog}^{\vec{m}}(\prod_{s \in S} \mathcal{C}_s, \mathcal{D}) \subseteq \mathrm{Homog}^n(\mathcal{C}, \mathcal{D}) \overset{\mathrm{cr}_{(n)}}{\to} \mathrm{SymFun}^n_{\mathrm{lin}}(\mathcal{C}, \mathcal{D}) \to \mathrm{SymFun}^{\vec{n}}_{\mathrm{lin}}(\mathcal{C}, \mathcal{D}).$$

If $\vec{m} = \vec{n}$, then iterated application of Theorem 6.1.4.7 shows that $U_{\vec{m}, \vec{n}}$ is an equivalence of ∞-categories. It $\vec{m} \neq \vec{n}$, we claim that $U_{\vec{m}, \vec{n}}$ carries each object $F \in \mathrm{Homog}^{\vec{m}}(\prod_{s \in S} \mathcal{C}_s, \mathcal{D})$ to a zero object of the ∞-category $\mathrm{SymFun}^{\vec{n}}_{\mathrm{lin}}(\mathcal{C}, \mathcal{D})$. Using Remark 6.3.4.13, we are reduced to proving that $\mathrm{cr}_{\vec{m}}(F)$ carries each object of $\prod_{s \in S} \mathcal{C}_s^{m_s}$ to a zero object of $\mathcal{D}$. Since $\sum_{s \in S} m_s = \sum_{s \in S} n_s$, we have $m_s > n_s$ for some $s \in S$, in which case the desired result follows by applying Proposition 6.1.3.22 to the functor $\mathcal{C}_s \to \mathrm{Fun}(\prod_{t \neq s} \mathcal{C}_t, \mathcal{D})$ determined by F.

小红书
小红书号:3189205503 qq

It follows from the above argument that the composite functor

$$\prod_{|\vec{m}|=n} \mathrm{Homog}^{\vec{m}}(\prod_{s\in S} \mathcal{C}_s, \mathcal{D}) \xrightarrow{\Phi} \mathrm{Homog}^n(\mathcal{C},\mathcal{D}) \xrightarrow{\mathrm{cr}_{(n)}} \mathrm{SymFun}^n_{\mathrm{lin}}(\mathcal{C},\mathcal{D}) \xrightarrow{\Psi} \prod_{|\vec{n}|=n} \mathrm{SymFun}^{\vec{n}}_{\mathrm{lin}}(\mathcal{C},\mathcal{D})$$

is an equivalence of ∞-categories, where Ψ is the equivalence of ∞-categories appearing in Lemma 6.3.4.12. Since $\mathrm{cr}_{(n)}$ is an equivalence of ∞-categories by Theorem 6.1.4.7, we conclude that Φ is an equivalence of ∞-categories. □

We now turn to the proof of Theorem 6.3.3.14.

Remark 6.3.4.14. Let $\{\mathcal{C}_s\}$ be a finite collection of pointed ∞-categories which admit finite colimits. Suppose we are given functors $F, F' : \prod_{s\in S} \mathcal{C}_s \to \mathcal{S}_*$ and an element $s \in S$ such that F' is 2-reduced when regarded as a functor from $\mathcal{C}_s$ to $\mathrm{Fun}(\prod_{t\neq s} \mathcal{C}_t, \mathcal{S}_*)$. Form fiber sequences

$$H \to F \to \varprojlim_{E\in \mathrm{Equiv}^+(S)} F^E.$$

$$H' \to F' \to \varprojlim_{E\in \mathrm{Equiv}^+(S)} F'^E.$$

Using Remark 6.1.1.29, we deduce that H' and each of the functors F'^E is also 2-reduced when regarded as a functor $\mathcal{C}_s \to \mathrm{Fun}(\prod_{t\neq s} \mathcal{C}_t, \mathcal{S}_*)$. It follows that the projection maps

$$H \times H' \to H \qquad (F \times F')^E \simeq F^E \times F'^E \to F^E$$

induce equivalences after applying the functor $P_{\vec{1}}$ for $\vec{1} = (1,\ldots,1)$, and therefore equivalences of differentials. Consequently, the conclusion of Theorem 6.3.3.14 is valid for F if and only if it is valid for the product $F \times F'$.

Proof of Theorem 6.3.3.14. Let n be the cardinality of the set S, let $\mathcal{C} = \prod_{s\in S} \mathcal{C}_s$, and let $\mathrm{Exc}_*(\prod_{s\in S} \mathcal{C}_s, \mathcal{S}_*)$ denote the full subcategory of $\mathrm{Fun}(\mathcal{C}, \mathcal{S}_*)$ spanned by those functors which are reduced and excisive in each variable. Note that any functor $F : \prod_{s\in S} \mathcal{C}_s \to \mathcal{D}$ which is 1-homogeneous in each variable is n-homogeneous when regarded as a functor from $\mathcal{C}$ to $\mathcal{D}$ (Corollary 6.1.3.11). It follows that any natural transformation $F' \to F$ which induces an equivalence $P_n F' \to P_n F$ also induces an equivalence of differentials $DF' \to DF$.

Let $F : \prod_{s\in S} \mathcal{C}_s \to \mathcal{S}_*$ be a functor which preserves final objects. For every subset $T \subseteq S$, let $F^T : \mathcal{C} \to \mathcal{S}_*$ be defined as in Construction 6.1.3.15, and note that $(P_n F^T) \simeq P_n(F^T)$. Since P_n is left exact, we conclude that $P_n \mathrm{Red}(F) \simeq \mathrm{Red}(P_n F)$. In particular, we have $D\,\mathrm{Red}(F) \simeq D\,\mathrm{Red}(P_n F)$ and $DF^E \simeq DP_n(F^E) \simeq D(P_n F)^E$ for each equivalence relation E on S. We may therefore replace F by $P_n F$ and thereby reduce to the case where F is n-excisive.

Using Proposition 6.3.4.4, we can choose a jet equivalence $|F_\bullet| \to F$ such that each F_k is a finite product of homogeneous functors from $\mathcal{C}$ to $\mathcal{D}$. Let F' denote the functor $|F_\bullet|$. Note that for every

小红书 小红书号:3189205503 qq

subset $T \subseteq S$, the functor F'^T is given by $|F'^T_\bullet|$ (using the notation of Construction 6.1.3.15). Since geometric realizations in $\mathcal{S}$ commute with products, we deduce that for every equivalence relation E on S, the canonical map $|F'^E_\bullet| \to F'^E$ is an equivalence. Since $F' \to F$ is a jet equivalence, the left exactness of the functors P_m implies that $F'^E \to F^E$ is a jet equivalence for every $E \in \mathrm{Equiv}(S)$, so that we have a jet equivalence $|F'^E_\bullet| \to F^E$. In particular, we obtain an equivalence of differentials $D|F'^E_\bullet| \simeq DF^E$, so that DF^E is the geometric realization of the simplicial object $DF'^E_\bullet$ in the ∞-category $\mathrm{Exc}_*(\prod_{s\in S} \mathcal{C}_s, \mathcal{S}_*)$. Since the ∞-category $\mathrm{Exc}_*(\prod_{s\in S} \mathcal{C}_s, \mathcal{S}_*)$ is stable (see Corollary 6.1.2.8), we deduce that the canonical map

$$|\operatorname{tfib}\{DF'^E_\bullet\}_{E\in \mathrm{Equiv}(S)}| \to \operatorname{tfib}\{|DF'^E_\bullet|\}_{E\in \mathrm{Equiv}(S)}$$

is an equivalence in $\mathrm{Exc}_*(\prod_{s\in S} \mathcal{C}_s, \mathcal{S}_*)$.

Let $H_\bullet$ be the simplicial functor given by $\operatorname{tfib}\{F'^E_\bullet\}_{E\in \mathrm{Equiv}(S)}$, and let $H = \operatorname{tfib}\{F^E\}_{E\in \mathrm{Equiv}(S)}$. It follows from Lemma 6.3.4.6 that the canonical map $|H_\bullet| \to H$ is a jet equivalence, so that $DH \simeq D|H_\bullet|$ is the geometric realization of the simplicial object of the simplicial object $dH_\bullet$ in the ∞-category $\mathrm{Exc}_*(\prod_{s\in S} \mathcal{C}_s, \mathcal{S}_*)$. It follows that the map

$$DH \to \operatorname{tfib}\{DF^E)\}_{E\in \mathrm{Equiv}(S)}$$

can be realized as a colimit of maps $DH_m \to \operatorname{tfib}\{F^E_m\}_{E\in \mathrm{Equiv}(S)}$. We may therefore replace F by F_m and thereby reduce to the case where $F : \mathcal{C} \to \mathcal{S}_*$ is a finite product of reduced homogeneous functors.

Using Proposition 6.3.4.11, we can write F as a finite product $\prod_{\alpha\in A} F_\alpha$, where each $F(\alpha)$ belongs to $\mathrm{Homog}^{\vec{n}_\alpha}(\prod_{s\in S} \mathcal{C}_s, \mathcal{S}_*)$, where $\vec{n}_\alpha = \{n_{\alpha,s}\}_{s\in S}$ is a collection of nonnegative integers with $|\vec{n}_\alpha| = \sum_{s\in S} n_{\alpha,s} > 0$. Let $A_0 \subseteq A$ be the subset consisting of those indices α such that $n_{\alpha,s} \leq 1$ for all $s \in S$. Let $\overline{F} = \prod_{\alpha\in A_0} F(\alpha)$. Applying Remark 6.3.4.14 repeatedly, we can replace F by $\overline{F}$ and thereby reduce to the case where $A_0 = A$. For every subset $T \subseteq S$, let F_T denote the product of those functors F_α for which $\alpha \in A$ satisfies $n_{\alpha,s} = \begin{cases} 1 & \text{if } s \in T \\ 0 & \text{if } s \notin T. \end{cases}$ Then $F \simeq \prod_{\emptyset \neq T \subseteq S} F_T$, where each F_T can be written as a composition

$$\prod_{s\in S} \mathcal{C}_s \to \prod_{s\in T} \mathcal{C}_s \xrightarrow{\widetilde{F}_T} \mathcal{S}_*$$

for some functor $\widetilde{F}_T$ which is reduced and excisive in each variable.

Let $\mathcal{U}$ be a collection of nonempty subsets of S, and set $F_{\mathcal{U}} = \prod_{T\in\mathcal{U}} F_T$. Note that for $E \in \mathrm{Equiv}(S)$, we have $F^E_{\mathcal{U}} = \prod_T F_T$, where the product is taken over all subsets $T \in \mathcal{U}$ which are contained in a single equivalence class of the equivalence relation E. If $T \neq S$, then the collection of equivalence relations $E \in \mathrm{Equiv}^+(S)$ satisfying this condition has a smallest element, and therefore a weakly contractible nerve. It follows that $\varprojlim_{E\in \mathrm{Equiv}^+(S)} F^E_{\mathcal{U}}$ is given by the product $\prod_{T\in\mathcal{U}, T\neq S} F_T$.

小红书
小红书号:3189205503 qq

Form a fiber sequence

$$H_{\mathcal{U}} \to F_{\mathcal{U}} \to \varprojlim_{E \in \mathrm{Equiv}^+(S)} F^E_{\mathcal{U}},$$

so that $H_{\mathcal{U}} \simeq \begin{cases} F_S & \text{if } S \in \mathcal{U} \\ * & \text{otherwise,} \end{cases}$ where $*$ denotes the constant functor $\mathcal{C} \to \mathcal{S}_*$ carrying every object to a single point.

We will prove that for every collection $\mathcal{U}$ of nonempty subsets of S, the canonical map

$$\theta_{\mathcal{U}} : DH_{\mathcal{U}} \to \mathrm{tfib}\{DF^E_{\mathcal{U}}\}_{E \in \mathrm{Equiv}(S)}$$

is an equivalence. Taking $\mathcal{U} = \mathbf{P}(S)$, we obtain a proof of the desired result. Our proof will proceed by induction on the cardinality of $\mathcal{U}$. Let us therefore assume that $\theta_{\mathcal{U}'}$ is an an equivalence for every proper subset $\mathcal{U}' \subsetneq \mathcal{U}$. Since the ∞-category $\mathrm{Exc}_*(\prod_{s \in S} \mathcal{C}_s, \mathcal{S}_*)$ is stable (Corollary 6.1.2.8) and the differentiation functor $d : \mathrm{Fun}(\prod_{s \in S} \mathcal{C}_s, \mathcal{S}_*) \to \mathrm{Exc}_*(\prod_{s \in S} \mathcal{C}_s, \mathcal{S}_*)$ preserves colimits, we deduce that the map

$$\theta' : D(\varinjlim_{\mathcal{U}' \subsetneq \mathcal{U}} H_{\mathcal{U}'}) \to \mathrm{tfib}\{D(\varinjlim_{\mathcal{U}' \subsetneq \mathcal{U}} F^E_{\mathcal{U}'}\}_{E \in \mathrm{Equiv}(S)}$$

For each equivalence relation $E \in \mathrm{Equiv}(S)$, let $G(E)$ denote the cofiber of the canonical map

$$\varinjlim_{\mathcal{U}' \subsetneq \mathcal{U}} F^E_{\mathcal{U}'} \to F^E_{\mathcal{U}}.$$

When $E = E_\perp$ is the discrete equivalence relation on S (that is, $sE_\perp t$ for all $s, t \in S$), we denote $G(E)$ by G. Let H_0 denote the cofiber of the map $\varprojlim_{\mathcal{U}' \subsetneq \mathcal{U}} H_{\mathcal{U}'} \to H_{\mathcal{U}}$. Using the description of the functor $H_{\mathcal{U}}$ given above, we see that

$$H_0 = \begin{cases} F_S & \text{if } \mathcal{U} = \{S\} \\ 0 & \text{otherwise.} \end{cases}$$

We have a fiber sequence

$$\theta' \to \theta_{\mathcal{U}} \to \theta''$$

in the stable ∞-category $\mathrm{Fun}(\Delta^1, \mathrm{Exc}_*(\prod_{s \in S} \mathcal{C}_s, \mathcal{S}_*))$, where θ'' denotes the canonical map

$$dH_0 \to \mathrm{tfib}\{DG(E)\}_{E \in \mathrm{Equiv}(S)}.$$

Consequently, to prove that $\theta_{\mathcal{U}}$ is an equivalence, it will suffice to show that θ'' is an equivalence. If $\mathcal{U} = \{S\}$, then $H_0 \simeq G \simeq F_S$ and $G(E)$ is trivial for $E \in \mathrm{Equiv}^+(S)$. Let us therefore assume that $\mathcal{U} \neq \{S\}$. Then H_0 is trivial, so we are reduced to proving that the canonical map

$$\phi : DG \to \mathrm{tfib}\{DG(E)\}_{E \in \mathrm{Equiv}(S)}$$

小红书
小红书号:3189205503 qq

is an equivalence.

Let $\wedge : \mathcal{S}_* \times \mathcal{S}_* \to \mathcal{S}_*$ denote the smash product functor on pointed spaces (see Example 6.2.3.28). Unwinding the definitions, we see that for each equivalence relation $E \in \mathrm{Equiv}(S)$, the functor $G(E)$ is given by the smash product $\bigwedge_{T \in \mathcal{U}} F_T$ if each element $T \in \mathcal{U}$ is contained in an equivalence class of E, and is trivial otherwise. There are several cases to consider:

(a) Suppose there is some element $s \in S$ which does not belong to any element of $\mathcal{U}$. Then each of the functors $G(E)$ is constant when regarded a functor $\mathcal{C}_s \to \mathrm{Fun}(\prod_{t \neq s} \mathcal{C}_t, \mathcal{S}_*)$, so that the differential $DG(E)$ is a zero object of $\mathrm{Exc}_*(\prod_{s \in S} \mathcal{C}_s, \mathcal{S}_*)$. In this case, ϕ is a map between zero objects of $\mathrm{Exc}_*(\prod_{s \in S} \mathcal{C}_s, \mathcal{S}_*)$, and therefore an equivalence.

(b) Suppose that some element $s \in S$ belongs to $T \cap T'$ for some pair of distinct elements $T, T' \in \mathcal{U}$. Using Proposition 6.1.3.10, we deduce that each of the functors $G(E)$ is 2-reduced when regarded as a functor from $\mathcal{C}_s$ to $\mathrm{Fun}(\prod_{t \neq s} \mathcal{C}_t, \mathcal{S}_*)$, so that the differential $DG(E)$ vanishes (Remark 6.3.4.14). We again see that ϕ is a map between zero objects of $\mathrm{Exc}_*(\prod_{s \in S} \mathcal{C}_s, \mathcal{S}_*)$, and therefore an equivalence.

(c) Suppose that $\mathcal{U} = \{T_1, \ldots, T_k\}$ for some collection of disjoint nonempty subsets $T_1, \ldots, T_k \subseteq S$ satisfying $S = \bigcup T_i$. Let $\mathrm{Equiv}^{++}(S) \subseteq \mathrm{Equiv}^{+}(S)$ be the subset consisting of those equivalence relations such that each T_i is contained in an equivalence class. Our analysis above shows that the functors $G(E)$ are given by the formula

$$G(E) = \begin{cases} G & \text{if } E \in \mathrm{Equiv}^{++}(S) \\ * & \text{otherwise,} \end{cases}$$

so that the diagram $(E \in \mathrm{Equiv}^{+}(S)) \mapsto G(E)$ is a right Kan extension of its restriction to the ∞-category $\mathrm{N}(\mathrm{Equiv}^{++}(S))^{op}$. Consequently, to prove that ϕ is an equivalence, it will suffice to show that the simplicial set $\mathrm{N}(\mathrm{Equiv}^{++}(S))$ is weakly contractible. In fact, the partially ordered set $\mathrm{Equiv}^{++}(S)$ has a smallest element: namely, the equivalence relation whose equivalence classes are precisely the sets T_i (note that this equivalence relation belongs to $\mathrm{Equiv}^{+}(S)$ by virtue of our assumption that $\mathcal{U} \neq \{S\}$).

□

6.3.5 Consequences of Theorem 6.3.3.14

Let $\{\mathcal{C}_s\}_{s \in S}$ be a nonempty finite collection of pointed ∞-categories which admit finite colimits, let $\mathcal{D}$ be a pointed differentiable ∞-category, and let

$$D : \mathrm{Fun}(\prod_{s \in S} \mathcal{C}_s, \mathcal{D}) \to \mathrm{Exc}_*(\prod_{s \in S} \mathcal{C}_s, \mathcal{D})$$

小红书
小红书号:3189205503 qq

be a left adjoint to the inclusion (given by differentiation). When restricted to the full subcategory of $\mathrm{Fun}(\prod_{s \in S} \mathcal{C}_s, \mathcal{D})$ spanned by those functors which are reduced in each variable, the functor D coincides with $P_{\vec{1}}$ of Proposition 6.1.3.6 (with $\vec{1} = (1, 1, \ldots, 1)$), and is therefore left exact. In general D is not left exact. Nevertheless, Theorem 6.3.3.14 implies that D commutes with a very special type of limits. In this section, we will apply Theorem 6.3.3.14 to show that differentiation commutes with a larger class of limits (Theorem 6.3.5.5). We will also obtain a generalization of the chain rule of Theorem 6.2.1.22 to the case of nonreduced functors (Theorem 6.3.5.6).

We begin by formulating a more general version of Theorem 6.3.3.14.

Notation 6.3.5.1. Let $p : S \to T$ be a map of finite sets. For each $t \in T$, we let S_t denote the fiber of $p^{-1}\{t\} \subseteq S$. We let $\mathrm{Equiv}_p(S)$ denote the subset of $\mathrm{Equiv}(S)$ consisting of those equivalence relations E on S such that p is constant on each equivalence class: that is, equivalence relations for which xEy implies $p(x) = p(y)$. If $E \in \mathrm{Equiv}(S)$ and $t \in T$, we let E_t denote the restriction of E to an equivalence relation on $S_t \subseteq S$. Note that the construction $E \mapsto \{E_t\}_{t \in T}$ determines an isomorphism of partially ordered sets $\mathrm{Equiv}_p(S) \simeq \prod_{t \in T} \mathrm{Equiv}(S_t)$. Note that $\mathrm{Equiv}_p(S)$ has a largest element E_p, where xE_py if and only if $p(x) = p(y)$. We let $\mathrm{Equiv}_p^+(S)$ denote the partially ordered set $\mathrm{Equiv}_p(S) - \{E_p\}$.

Proposition 6.3.5.2. *Let $p : S \to T$ be a surjective map of nonempty finite sets. Suppose we are given a collection of pointed ∞-categories $\{\mathcal{C}_s\}_{s \in S}$ which admit finite colimits, a collection of pointed ∞-categories $\{\mathcal{D}_t\}_{t \in T}$, and a pointed presentable differentiable ∞-category $\mathcal{E}$. Let $\{F_t : \prod_{p(s)=t} \mathcal{C}_s \to \mathcal{D}_t\}$ and $G : \prod_{t \in T} \mathcal{D}_t \to \mathcal{E}$ be functors which preserve zero objects. For each $E \in \mathrm{Equiv}_p(S)$, let F^E denote the functor*

$$\prod_{s \in S} \mathcal{C}_s \xrightarrow{\prod_{t \in T} F_t^{E_t}} \prod_{t \in T} \mathcal{D}_t .$$

Then the canonical map

$$D(G \circ \mathrm{tfib}\{F^E\}_{E \in \mathrm{Equiv}_p(S)}) \to \mathrm{tfib}\{D(G \circ F^E)\}_{E \in \mathrm{Equiv}_p(S)}$$

is an equivalence in the ∞-category $\mathrm{Exc}_*(\prod_{s \in S} \mathcal{C}_s, \mathcal{E})$.

Remark 6.3.5.3. In the special case where T has a single element, $\mathcal{E} = \mathcal{S}_*$, and the functor G is an equivalence, Proposition 6.3.5.2 reduces to Theorem 6.3.3.14.

Before giving the proof of Proposition 6.3.5.2, let us describe some of its consequences.

Notation 6.3.5.4. If $\mathcal{C}$ and $\mathcal{D}$ are compactly generated ∞-categories, we let $\mathrm{Fun}^c(\mathcal{C}, \mathcal{D})$ denote the full subcategory of $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$ spanned by those functors which preserve filtered colimits.

小红书
小红书号:3189205503 qq

Theorem 6.3.5.5. *Let S be a nonempty finite set. Suppose we are given compactly generated pointed ∞-categories $\{\mathcal{C}_s\}_{s \in S}$, and $\mathcal{D}$. Let K be a finite simplicial set and suppose we are given a diagram*

$$\alpha : K^{\triangleleft} \to \mathrm{Fun}^{c}(\prod_{s \in S} \mathcal{C}_s, \mathcal{D}),$$

carrying each vertex $v \in K^{\triangleleft}$ to a functor $F_v : \prod_{s \in S} \mathcal{C}_s \to \mathcal{D}$. For every nonempty subset $S' \subseteq S$, let $F_{v,S'}$ denote the restriction of F_v to

$$\prod_{s \in S'} \mathcal{C}_s \simeq \prod_{s \in S'} \mathcal{C}_s \times \prod_{s \in S - S'} \{*_s\} \subseteq \prod_{s \in S} \mathcal{C}_s;$$

here $*_s$ denotes a zero object of $\mathcal{C}_s$ for $s \in S$. Assume that:

(1) *Each of the functors F_v carries zero objects of $\prod_{s \in S} \mathcal{C}_s$ to zero objects of $\mathcal{D}$.*

(2) *For each equivalence relation $E \in \mathrm{Equiv}(S)$, there exists a map of finite simplicial sets $u : K \to \prod_{S' \in S/E} K_{S'}$ satisfying the following conditions:*

   (a) *The map of simplicial sets u is right cofinal.*

   (b) *For each $S' \in S/E$, there exists a limit diagram $\beta_{S'} : K_{S'}^{\triangleleft} \to \mathrm{Fun}^{c}(\prod_{s \in S'} \mathcal{C}_s, \mathcal{D})$ such that the composite map*

$$K^{\triangleleft} \xrightarrow{u} \prod_{S'' \in S/E} K_{S''}^{\triangleleft} \to K_{S'}^{\triangleleft} \xrightarrow{\beta_{S'}} \mathrm{Fun}^{c}(\prod_{s \in S'} \mathcal{C}_s, \mathcal{D})$$

   is given by $v \mapsto F_{v,S'}$.

Let v_0 denote the cone point of $K^{\triangleleft}$. Then the canonical map

$$\phi : \vec{\partial}(F_{v_0}) \to \varprojlim_{v \in K} \vec{\partial}(F_v)$$

is an equivalence in $\mathrm{Exc}_*(\prod_{s \in S} \mathrm{Sp}(\mathcal{C}_s), \mathrm{Sp}(\mathcal{D}))$.

Proof of Theorem 6.3.5.5. For every compact object $D \in \mathcal{D}$, let $J_D : \mathcal{D} \to \mathcal{S}_*$ denote the functor corepresented by D. Then J_D is left exact, so that its derivative $j_D = \partial(J_D) : \mathrm{Sp}(\mathcal{D}) \to \mathrm{Sp}$ is given by pointwise composition with J_D (Example 6.2.1.4). Since $\mathcal{D}$ is compactly generated, the functors j_D are jointly conservative. Consequently, it will suffice to show that each of the induced maps

$$\alpha_G : j_D \circ \vec{\partial}(F_{v_0}) \to \varprojlim j_D \circ \vec{\partial}(F_v)$$

is an equivalence. Using Theorem 6.2.1.22, we can identify α with the map

$$\vec{\partial}(J_D \circ \prod_{s \in S} F_s) \to \varprojlim_{v \in K} \vec{\partial}(J_D \circ F_v).$$

小红书
小红书号:3189205503 qq

We may therefore replace F by $J_D \circ F$ and thereby reduce to the case where $\mathcal{D} = \mathcal{S}_*$.

For each equivalence relation $E \in \mathrm{Equiv}(S)$, let ϕ_E denote the canonical map $\vec{\partial}(F^E_{v_0}) \to \varprojlim_{v \in K} \vec{\partial}(F^E_v)$. We will prove that each of the maps ϕ_E is an equivalence. The proof will proceed by induction. For every equivalence relation E, let $\mathrm{Equiv}_E(S)$ denote the collection of equivalence relations on S that refine E (that is, $\mathrm{Equiv}_E(S) = \{E' \in \mathrm{Equiv}(S) : E' \leq E\}$) and let $\mathrm{Equiv}^+_E(S) = \mathrm{Equiv}_E(S) - \{E\}$. To complete the proof, it will suffice to show that if $E \in \mathrm{Equiv}(S)$ has the property that $\phi_{E'}$ is an equivalence for each $E' \in \mathrm{Equiv}^+_E(S)$, then ϕ_E is an equivalence.

Fix an equivalence relation $E \in \mathrm{Equiv}(S)$ as above, and let $T = S/E$. Let $G : \prod_{t \in T} \mathcal{S}_* \to \mathcal{S}_*$ denote the functor given by iterated Cartesian product. Then ϕ_E can be identified with the upper horizontal map appearing in the diagram σ :

$$\begin{array}{ccc} \vec{\partial}(G \circ \prod_{S' \in T} F_{v_0,S'}) & \longrightarrow & \varprojlim_{v \in K} \vec{\partial}(G \circ \prod_{S' \in T} F_{v,S'}) \\ \downarrow & & \downarrow \\ \varprojlim_{E' \in \mathrm{Equiv}^+_E(S)} \mathrm{Diff}(G \circ \prod_{S' \in T} F^{E'}_{v_0,S'}) & \longrightarrow & \varprojlim_{v \in K} \varprojlim_{E' \in \mathrm{Equiv}^+_E(S)} (\vec{\partial}(G \circ \prod_{S' \in T} F^{E'}_{v,S'})). \end{array}$$

Here the lower horizontal map is an equivalence by the inductive hypothesis. Since $\mathrm{Exc}_*(\prod_{s \in S} \mathrm{Sp}(\mathcal{C}_s), \mathrm{Sp})$ is a stable ∞-category, it will suffice to show that σ induces an equivalence after passing to the fibers of the vertical maps. Using Proposition 6.3.5.2, we are reduced to providing that the map

$$\vec{\partial}(G \circ \prod_{S' \in T} \mathrm{Red}(F_{v_0,S'})) \to \varprojlim_{v \in K} \vec{\partial}(G \circ \prod_{S' \in T} \mathrm{Red}(F_{v,S'}))$$

is an equivalence.

Let $G' : \prod_{t \in T} \mathcal{S}_* \to \mathcal{S}_*$ denote the iterated smash product functor. For each vertex $v \in K$, the canonical map

$$G \circ \prod_{S' \in T} \mathrm{Red}(F_{v,S'}) \to G' \circ \prod_{S' \in T} \mathrm{Red}(F_{v,S'})$$

induces an equivalence of derivatives. It will therefore suffice to show that the canonical map

$$\theta : \vec{\partial}(G' \circ \prod_{S' \in T} \mathrm{Red}(F_{v_0,S'})) \to \varprojlim_{v \in K} \vec{\partial}(G' \circ \prod_{S' \in T} \mathrm{Red}(F_{v,S'}))$$

is an equivalence. Using Theorem 6.2.1.22 and Example 6.2.3.28, we can identify θ with the canonical map

$$\theta' : \otimes_{S' \in T} \vec{\partial}(\mathrm{Red}(F_{v_0,S'})) \to \varprojlim_{v \in K} \otimes_{S' \in T} \vec{\partial}(\mathrm{Red}(F_{v,S'})).$$

Choose a map $u : K \to \prod_{S' \in S/E} K_{S'}$ and maps $\beta_{S'} : K^{\triangleleft}_{S'} \to \mathrm{Fun}^c(\prod_{s \in S'} \mathcal{C}_s, \mathcal{D})$ as in (2). For $S' \in T$, let $v_{0,S'}$ denote the cone point of $K^{\triangleleft}_{S'}$. Using the right cofinality of u, we can identify θ with the canonical map

$$\otimes_{S' \in T} \vec{\partial}\, \mathrm{Red}(\beta_{S'}(v_{0,S'})) \to \varprojlim_{\{v_{S'} \in K_{S'}\}} \otimes_{S' \in T} \vec{\partial}\, \mathrm{Red}(\beta_{S'}(v_{S'})) \simeq \otimes_{S' \in T} \varprojlim_{v_{S'} \in K_{S'}} \vec{\partial}\, \mathrm{Red}(\beta_{S'}(v_{S'})).$$

小红书
小红书号:3189205503 qq

We are therefore reduced to proving that for each $S' \in T$, the canonical map

$$\vec{\partial} \operatorname{Red}(\beta_{S'}(v_{0,S'})) \to \varprojlim_{v_{S'} \in K_{S'}} \vec{\partial} \operatorname{Red}(\beta_{S'}(v_{S'}))$$

is an equivalence. Since differentiation is left exact when restricted to functors which are reduced in each variable, so it suffices to show that $\operatorname{Red}(\beta_{S'}(v_{0,S'})) \simeq \varprojlim_{v_{S'} \in K_{S'}} \operatorname{Red} \beta_{S'}(v_{S'})$ is an equivalence. This follows from our assumption that $\beta_{S'}$ is a limit diagram, since the reduction functor Red is left exact. □

Theorem 6.3.5.6. *Let $p : S \to T$ be a surjective map of nonempty finite sets. Suppose we are given compactly generated pointed ∞-categories $\{\mathcal{C}_s\}_{s \in S}$, $\{\mathcal{D}_t\}_{t \in T}$, and $\mathcal{E}$. Let $G \in \operatorname{Fun}^c(\prod_{t \in T} \mathcal{D}_t, \mathcal{E})$. Let K be a finite simplicial set, and suppose that for each $t \in T$ we are given a diagram*

$$K^{\triangleleft} \to \operatorname{Fun}^c(\prod_{s \in S_t} \mathcal{C}_s, \mathcal{D}_t),$$

carrying each vertex $v \in K^{\triangleleft}$ to a functor $F_{t,v} : \prod_{s \in S_t} \mathcal{C}_s \to \mathcal{D}_t$. Assume that:

(1) *Each of the functors $F_{t,v}$ carries zero objects of $\prod_{s \in S_t} \mathcal{C}_s$ to zero objects of $\mathcal{D}_t$, and G carries zero objects of $\prod_{t \in T} \mathcal{D}_t$ to zero objects of $\mathcal{E}$.*

(2) *For each $E \in \operatorname{Equiv}_p^+(S)$, there exists a map of finite simplicial sets $u : K^{\triangleleft} \to K_E^{\triangleleft}$ satisfying the following conditions:*

   (a) *The underlying map $K \to K_E^{\triangleleft}$ is right cofinal.*

   (b) *For each $t \in T$, the functor $K^{\triangleleft} \to \operatorname{Fun}^c(\prod_{s \in S_t} \mathcal{C}_s, \mathcal{D}_t)$ given by $v \mapsto F_{t,v}^{E_t}$ factors through u.*

   (c) *The map u carries the cone point of $K^{\triangleleft}$ to the cone point of $K_E^{\triangleleft}$.*

Let v_0 denote the cone point of $K^{\triangleleft}$. Then the diagram σ:

$$\begin{array}{ccc} \vec{\partial}(G \circ \prod_{t \in T} F_{t,v_0}) & \longrightarrow & \varprojlim_{v \in K} \vec{\partial}(G \circ \prod_{t \in T} F_{t,v}) \\ \downarrow & & \downarrow \\ \vec{\partial}(G) \circ \prod_{t \in T} \vec{\partial}(F_{t,v_0}) & \longrightarrow & \varprojlim_{v \in K} \vec{\partial}(G) \circ \prod_{t \in T} \vec{\partial}(F_{t,v}) \end{array}$$

is a pullback square in $\operatorname{Fun}(\prod_{s \in S} \operatorname{Sp}(\mathcal{C}_s), \operatorname{Sp}(\mathcal{E}))$.

Proof. For each $E \in \operatorname{Equiv}_p^+(S)$, let $\sigma(E)$ denote the diagram

$$\begin{array}{ccc} \vec{\partial}(G \circ \prod_{t \in T} F_{t,v_0}^{E_t}) & \longrightarrow & \varprojlim_{v \in K} \vec{\partial}(G \circ \prod_{t \in T} F_{t,v}^{E_t}) \\ \downarrow & & \downarrow \\ \vec{\partial}(G) \circ \prod_{t \in T} \vec{\partial}(F_{t,v_0}^{E_t}) & \longrightarrow & \varprojlim_{v \in K} \vec{\partial}(G) \circ \prod_{t \in T} \vec{\partial}(F_{t,v}^{E_t}). \end{array}$$

小红书 小红书号:3189205503 qq

Form a fiber sequence

$$\tau \to \sigma \to \varprojlim_{E \in \mathrm{Equiv}_p^+(S)} \sigma(E).$$

in the stable ∞-category $\mathrm{Fun}(\Delta^1 \times \Delta^1, \mathrm{Exc}_*(\prod_{s \in S} \mathrm{Sp}(\mathcal{C}_s), \mathrm{Sp}(\mathcal{E})))$. To prove that σ is a pullback diagram, it will suffice to show that τ is a pullback diagram and that $\sigma(E)$ is a pullback diagram, for each $E \in \mathrm{Equiv}_p^+(S)$.

We first show that τ is a pullback diagram. Unwinding the definitions, we can write τ as a commutative diagram

$$\begin{array}{ccc} \mathrm{tfib}\{\vec{\partial}(G \circ \prod_t F_{t,v_0}^{E_t})\}_{E \in \mathrm{Equiv}_p(S)} & \longrightarrow & \varprojlim_{v \in K} \mathrm{tfib}\{\vec{\partial}(G \circ \prod_t F_{t,v}^{E_t})\}_{E \in \mathrm{Equiv}_p(S)} \\ \downarrow & & \downarrow \\ \mathrm{tfib}\{\vec{\partial}(G) \circ \prod_t \vec{\partial}(F_{t,v_0}^{E_t})\}_{E \in \mathrm{Equiv}_p(S)} & \longrightarrow & \varprojlim_{v \in K} \mathrm{tfib}\{\vec{\partial}(G) \circ \prod_t \vec{\partial}(F_{t,v}^{E_t})\}_{E \in \mathrm{Equiv}_p(S)}. \end{array}$$

To prove that this diagram is a pullback square, it will suffice to show that the vertical maps are equivalences. Fix a vertex $v \in K^{\triangleleft}$; we will show that the map

$$\theta : \mathrm{tfib}\{\vec{\partial}(G \circ \prod_{t \in T} F_{t,v}^{E_t})\}_{E \in \mathrm{Equiv}_p(S)} \to \mathrm{tfib}\{\vec{\partial}(G) \circ \prod_{t \in T} \vec{\partial}(F_{t,v}^{E_t})\}_{E \in \mathrm{Equiv}_p(S)}$$

is an equivalence. Since the functor $\vec{\partial}(G)$ is left exact in each variable, the right hand side is given by

$$\vec{\partial}(G) \circ \prod_{t \in T} \mathrm{tfib}\{\vec{\partial}(F_{t,v}^{E_t})\}_{E_t \in \mathrm{Equiv}(S_t)}.$$

We have a commutative diagram

$$\begin{array}{ccc} \vec{\partial}(G \circ \prod_{t \in T} \mathrm{tfib}\{F_{t,v}^{E_t}\}_{E_t \in \mathrm{Equiv}(S_t)}) & \longrightarrow & \mathrm{tfib}\{G \circ \prod_{t \in T} F_{t,v}^{E_t}\}_{E \in \mathrm{Equiv}_p(S)} \\ \downarrow{\scriptstyle \theta'} & & \downarrow{\scriptstyle \theta} \\ \vec{\partial}(G) \circ \prod_{t \in T} \vec{\partial}(\mathrm{tfib}\{F_{t,v}^{E_t}\}_{E_t \in \mathrm{Equiv}(S_t)}) & \longrightarrow & \vec{\partial}(G) \circ \prod_{t \in T} \mathrm{tfib}\{\vec{\partial}(F_{t,v}^{E_t})\}_{E_t \in \mathrm{Equiv}(S_t)}. \end{array}$$

The horizontal maps in this diagram are equivalences by Proposition 6.3.5.2. We are therefore reduced to proving that θ' is an equivalence. This follows from Theorem 6.2.1.22, since each of the functors $\mathrm{tfib}\{F_{t,v}^{E_t}\}$ is reduced in each variable. This completes the proof that τ is a pullback square.

Now suppose that $E \in \mathrm{Equiv}_p^+(S)$; we will show that the diagram $\sigma(E)$ is a pullback square. Choose a map $u : K^{\triangleleft} \to K_E^{\triangleleft}$ satisfying the requirements of hypothesis (2). Condition (b) implies that for each $t \in T$, we can choose a diagram $u_t' : K_{t,E}^{\triangleleft} \to \mathrm{Fun}^c(\prod_{s \in S_t} \mathcal{C}_s, \mathcal{D}_t)$ such that the composition of $u_t' \circ u_t$ is given by the formula $v \mapsto F_{t,v}^{E_t}$. Let $K_E^{\triangleleft}$ denote the product $\prod_{t \in T} K_{t,E}^{\triangleleft}$.

小红书 小红书号:3189205503 qq

For each vertex $w \in \{w_t\}_{t \in T}$, let $H_{t,w} : \prod_{s \in S_t} \mathcal{C}_s \to \mathcal{D}_t$ denote the image of w_t under the diagram u'_t. Then we rewrite $\sigma(E)$ as a diagram

$$\begin{array}{ccc} \vec{\partial}(G \circ \prod_{t \in T} H_{t,u_t(v_0)}) & \longrightarrow & \varprojlim_{v \in K} \vec{\partial}(G \circ \prod_{t \in T} H_{t,u_t(v)}) \\ \downarrow & & \downarrow \\ \vec{\partial}(G) \circ \prod_{t \in T} \vec{\partial}(H_{t,u_t(v_0)}) & \longrightarrow & \varprojlim_{v \in K} \vec{\partial}(G) \circ \prod_{t \in T} \vec{\partial}(H_{t,u_t(v)}). \end{array}$$

Let w_0 denote the cone point of $K^{\triangleleft}_E$. Using assumptions (a) and (c), we can rewrite the diagram $\sigma(E)$ again:

$$\begin{array}{ccc} \vec{\partial}(G \circ \prod_{t \in T} H_{t,w_0}) & \longrightarrow & \varprojlim_{w \in K^{\triangleleft}_E} \vec{\partial}(G \circ \prod_{t \in T} H_{t,w}) \\ \downarrow & & \downarrow \\ \vec{\partial}(G) \circ \prod_{t \in T} \vec{\partial}(H_{t,w_0}) & \longrightarrow & \varprojlim_{w \in K^{\triangleleft}_E} \vec{\partial}(G) \circ \prod_{t \in T} \vec{\partial}(H_{t,w}). \end{array}$$

Since $K^{\triangleleft}_E$ contains w_0 as an initial object, the horizontal maps in this diagram are equivalences. $\square$

The proof of Proposition 6.3.5.2 will require a bit of terminology.

Notation 6.3.5.7. Let $\{\mathcal{C}_s\}_{s \in S}$ be a nonempty finite collection of pointed ∞-categories which admit finite colimits, and let $\mathcal{D}$ be a differentiable ∞-category. Suppose we are given functors

$$F : \prod_{s \in S} \mathcal{C}_s \to \mathcal{D} \qquad f : \prod_{s \in S} \mathcal{C}_s \to \mathrm{Sp}(\mathcal{D}).$$

We will say that a natural transformation $\alpha : F \to \Omega^{\infty}_{\mathcal{D}} \circ f$ *exhibits* f *as a predifferential of* F if it exhibits $\Omega^{\infty}_{\mathcal{D}} \circ f$ as a differential of f, in the sense of Definition 6.2.3.1.

Using Proposition 1.4.2.22, we see that $\Omega^{\infty}_{\mathcal{D}}$ induces a trivial Kan fibration

$$\mathrm{Exc}_*(\prod_{s \in S} \mathcal{C}_s, \mathrm{Sp}(\mathcal{D})) \to \mathrm{Exc}_*(\prod_{s \in S} \mathcal{C}_s, \mathcal{D}).$$

It follows from Proposition 6.2.3.13 that for every functor $F : \prod_{s \in S} \mathcal{C}_s \to \mathcal{D}$, there exists a functor $f : \prod_{s \in S} \mathcal{C}_s \to \mathrm{Sp}(\mathcal{D})$ and a natural transformation $\alpha : F \to \Omega^{\infty}_{\mathcal{D}} \circ f$. The functor f is determined by f up to equivalence; we will denote it by $d(F)$.

Example 6.3.5.8. In the situation of Notation 6.3.5.7, let $\Sigma^{\infty}_{\mathcal{D}} : \mathcal{D} \to \mathrm{Sp}(\mathcal{D})$ be a left adjoint to $\Omega^{\infty}_{\mathcal{D}}$ (Proposition 6.2.3.16). Then a natural transformation $\alpha : F \to \Omega^{\infty}_{\mathcal{D}} \circ f$ exhibits f as a predifferential of F if and only if the adjoint map $\Sigma^{\infty}_{\mathcal{D}} \circ F \to f$ exhibits f as a differential of $\Sigma^{\infty}_{\mathcal{D}} \circ F$.

Lemma 6.3.5.9. *Let $p : S \to T$ be a surjective map between nonempty finite sets, and let $\{\mathcal{C}_s\}_{s \in S}$ be a collection of pointed ∞-categories which admit finite colimits. Suppose we are given a collection*

小红书
小红书号:3189205503 qq

of functors $\{F_t : \prod_{p(s)=t} \mathcal{C}_s \to \mathcal{S}_*\}_{t \in T}$ *such that each* $F_t(\{*_s\}_{p(s)=t})$ *is contractible. Let* F *denote the composite functor*

$$\prod_{s \in S} \mathcal{C}_s \overset{\prod F_t}{\to} \prod_{t \in T} \mathcal{S}_* \overset{\times}{\to} \mathcal{S}_* .$$

For each $E \in \mathrm{Equiv}_p(S)$*, let* $F^E_\times$ *denote the composition*

$$\prod_{s \in S} \mathcal{C}_s \overset{\prod F_t^{E_t}}{\longrightarrow} \prod_{t \in T} \mathcal{S}_* \overset{\times}{\to} \mathcal{S}_* .$$

Then the canonical map

$$d\,\mathrm{tfib}\{F^E_\times\}_{E \in \mathrm{Equiv}_p(S)} \to \mathrm{tfib}\{dF^E_\times\}_{E \in \mathrm{Equiv}_p(S)}$$

is an equivalence.

Proof. Let $E \in \mathrm{Equiv}_p(S)$. Since the formation of products in $\mathcal{S}$ preserves colimits separately in each variable, the product functor on $\mathcal{S}_*$ preserves contractible colimits seperately in each variable. It follows that the coreduction of $F^E_\times$ is given by the composition

$$\prod_{s \in S} \mathcal{C}_s \overset{\prod_{t \in T} \mathrm{cored}(F_t^{E_t})}{\longrightarrow} \prod_{t \in T} \mathcal{S}_* \overset{\wedge}{\to} \mathcal{S}_* .$$

Consequently, the functor $\Sigma^\infty \circ \mathrm{cored}(F^E_\times) : \prod_{s \in S} \mathcal{C}_s \to \mathrm{Sp}$ is given by the composition

$$\prod_{s \in S} \mathcal{C}_s \overset{\prod_{t \in T} \mathrm{cored}(F_t^{E_t})}{\longrightarrow} \prod_{t \in T} \mathcal{S}_* \overset{\Sigma^\infty}{\to} \prod_{t \in T} \mathrm{Sp} \overset{\otimes}{\to} \mathrm{Sp},$$

where $\otimes$ denotes the functor given by iterated smash product of spectra. Since the functor $\otimes$ is left exact and preserves sequential colimits in each variable, we have canonical equivalences

$$\begin{aligned} d(F^E_\times) &\simeq d(\mathrm{cored}(F^E_\times)) \\ &\simeq D(\Sigma^\infty \circ \mathrm{cored}(F^E_\times)) \\ &\simeq \otimes_{t \in T} D(\Sigma^\infty \circ \mathrm{cored}(F_t^{E_t})) \\ &\simeq \otimes_{t \in T} d(\mathrm{cored}(F_t^{E_t})) \\ &\simeq \otimes_{t \in T} d(F_t^{E_t}). \end{aligned}$$

It follows that the differential $d(F^E_\times)$ is given by the composition

$$\prod_{s \in S} \mathcal{C}_s \overset{d(F_t^{E_t})}{\longrightarrow} \prod_{t \in T} \mathrm{Sp} \overset{\otimes}{\to} \mathrm{Sp} \overset{\Omega^\infty}{\to} \mathcal{S}_* .$$

小红书
小红书号:3189205503 qq

Since the formation of smash products of spectra is left exact in each variable, Remark 6.3.3.9 implies that the total fiber $\mathrm{tfib}\{D(F^E_\times)\}_{E \in \mathrm{Equiv}_p(S)}$ is given by the composition

$$\prod_{s \in S} \mathcal{C}_s \xrightarrow{\mathrm{tfib}\{d(F_t^{E_t})\}} \prod_{t \in T} \mathrm{Sp} \xrightarrow{\otimes} \mathrm{Sp} \xrightarrow{\Omega^\infty} \mathcal{S}_* .$$

Invoking Theorem 6.3.3.14, we can identify this composition with the functor

$$\prod_{s \in S} \mathcal{C}_s \xrightarrow{\prod_{t \in T} d(\mathrm{Red}(F_t))} \prod_{t \in T} \mathrm{Sp} \xrightarrow{\otimes} \mathrm{Sp} \xrightarrow{\Omega^\infty} \mathcal{S}_*,$$

which is the differential of the functo

$$\prod_{s \in S} \mathcal{C}_s \xrightarrow{\prod_t \mathrm{Red}(F_t)} \prod_{t \in T} \mathcal{S}_* \xrightarrow{\times} \mathcal{S}_* .$$

Using Remark 6.3.3.9 again, we can identify this composition with $\mathrm{tfib}\{F^E_\times\}_{E \in \mathrm{Equiv}_p(S)}$. □

Proof of Proposition 6.3.5.2. It will suffice to show that the natural transformation

$$d(G \circ \mathrm{tfib}\{F^E\}_{E \in \mathrm{Equiv}_p(S)}) \to \mathrm{tfib}\{d(G \circ F^E)\}_{E \in \mathrm{Equiv}_p(S)}$$

is an equivalence in $\mathrm{Fun}(\prod_{s \in S} \mathcal{C}_s, \mathrm{Sp}(\mathcal{E}))$ (we can then deduce the analogous result for differentials by composing with the left exact functor $\Omega^\infty_{\mathcal{E}}$). Replacing G by $\Sigma^\infty_{\mathcal{E}} \circ G$ (and using Example 6.3.5.8), we are reduced to proving Proposition 6.3.3.14 in the special case where the ∞-category $\mathcal{E}$ is stable.

We may assume without loss of generality that the ∞-categories $\mathcal{C}_s$ and $\mathcal{D}_t$ are small. Let $\mathcal{X}$ denote the full subcategory of $\mathrm{Fun}(\prod_{t \in T} \mathcal{D}_t, \mathcal{E})$ spanned by those functors which preserve zero objects. Let us regard the functors $F_t : \prod_{p(s)=t} \mathcal{C}_s \to \mathcal{D}_t$ as fixed, and allow G to vary over objects of $\mathcal{X}$. For each $G \in \mathcal{X}$, let θ_G denote the canonical map

$$D(G \circ \mathrm{tfib}\{F^E\}_{E \in \mathrm{Equiv}_p(S)}) \to \mathrm{tfib}\{D(G \circ F^E)\}_{E \in \mathrm{Equiv}_p(S).}$$

Let $\mathcal{X}_0 \subseteq \mathcal{X}$ denote the full subcategory spanned by those functors $G \in \mathcal{X}$ such that θ_G is an equivalence. We wish to show that $\mathcal{X}_0 = \mathcal{X}$.

For every collection of objects $\vec{D} = \{D_t \in \mathcal{D}_t\}_{t \in T}$ and every object $E \in \mathcal{E}$, let $G_{\vec{D},E} \in \mathcal{X}$ be the functor given by the formula

$$G_{\vec{D},E}(\{D'_t\}_{t \in T}) = (\prod_{t \in T} \mathrm{Map}_{\mathcal{D}_t}(D_t, D'_t)) \wedge E$$

(here $\wedge : \mathcal{S}_* \times \mathcal{E} \to \mathcal{E}$ indicates the action of the ∞-category of pointed spaces on $\mathcal{E}$; see Proposition 4.8.2.11). Let $\mathcal{X}_1$ denote the smallest full subcategory of $\mathcal{X}$ which is closed under small colimits and contains each $G_{\vec{D},E}$. Using the presentability of $\mathcal{E}$, we deduce that $\mathcal{X}_1$ is generated by a small collection of objects under small colimits, and is therefore a presentable ∞-category.

小红书
小红书号:3189205503 qq

Using Corollary HTT.5.5.2.9 , we deduce that the inclusion $\mathcal{X}_1 \to \mathcal{X}$ admits a right adjoint V. We claim that V is conservative (so that $\mathcal{X}_1 = \mathcal{X}$). To prove this, consider a morphism $\alpha : G \to G'$ in $\mathcal{X}$ such that $V(\alpha)$ is an equivalence. Then the composite map

$$\mathrm{Map}_{\mathcal{E}}(E, G(\vec{D})) \simeq \mathrm{Map}_{\mathcal{X}}(G_{\vec{D},E}, G) \to \mathrm{Map}_{\mathcal{X}}(G_{\vec{D},E}, G') \simeq \mathrm{Map}_{\mathcal{E}}(E, G'(\vec{D}))$$

is a homotopy equivalence for every pair $(\vec{D}, E)$, from which it follows that α is an equivalence.

To prove that $\mathcal{X}_0 = \mathcal{X}$, it will suffice to show that $\mathcal{X}_1 \subseteq \mathcal{X}_0$. Using the stability of $\mathcal{E}$, we deduce that the construction $G \mapsto \theta_G$ preserves small colimits. It follows that $\mathcal{X}_0$ is closed under small colimits in $\mathcal{X}$. It will therefore suffice to show that $G_{\vec{D},E} \in \mathcal{X}_1$ for every pair $(\vec{D}, E)$. In other words, we can reduce to the case where the functor G is given by a composition

$$\prod_{t \in T} \mathcal{D}_t \overset{e_{\vec{D}}}{\to} \mathcal{S}_* \overset{\Sigma^\infty}{\to} \mathrm{Sp} \overset{\otimes E}{\to} \mathcal{E}\,.$$

where $e_{\vec{D}}$ denotes the functor corepresented by $\vec{D} \in \prod_{t \in T} \mathcal{D}_t$. Since the last of these functors commutes with small colimits and finite limits, we can replace G by the composition $\Sigma^\infty \circ e_{\vec{D}}$ and $\mathcal{E}$ by the ∞-category of spectra. Using Example 6.3.5.8, we are reduced to proving that the canonical map

$$\psi : d(e_{\vec{D}} \circ \mathrm{tfib}\{F^E\}_{E \in \mathrm{Equiv}_p(S)}) \to \mathrm{tfib}\{d(e_{\vec{D}} \circ F^E)\}_{E \in \mathrm{Equiv}_p(S)}.$$

For each $t \in T$, let $F'_t : \prod_{p(s)=t} \mathcal{C}_s \to \mathcal{S}_*$ denote the composite functor

$$\prod_{p(s)=t} \mathcal{C}_S \overset{F_t}{\to} \mathcal{D}_t \overset{\mathrm{Map}_{\mathcal{D}}(D_t, \bullet)}{\longrightarrow} \mathcal{S}_*\,.$$

Since corepresentable functors preserve limits, we can identify ψ with the canonical map

$$D(\mathrm{tfib}\{F'^E\}_{E \in \mathrm{Equiv}_p(S)}) \to \mathrm{tfib}\{d(F'^E)\}_{E \in \mathrm{Equiv}_p(S)}.$$

The desired result now follows from Lemma 6.3.5.9. □

6.3.6 The Dual Chain Rule

Recall that Theorem 6.3.2.3 asserts that if $q : \mathcal{C}^\otimes \to \Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ is a thin Δ^2-family of ∞-operads satisfying some mild hypotheses, then the stabilization of q is also a thin Δ^2-family of ∞-operads. We will devote the entirety of this section to the proof of Theorem 6.3.2.3. We begin with a simple combinatorial lemma.

Lemma 6.3.6.1. *Let K be a finite product of simplices $\prod_{1 \leq i \leq n} \Delta^{a_i}$, and let v denote the final vertex of K. Let P denote the partially ordered set of nondegenerate simplices of K (ordered by inclusion) and let $P^0 = P - \{v\}$. If at least one of the integers a_i is positive, then $\mathrm{N}(P^0)$ is weakly contractible.*

小红书
小红书号:3189205503 qq

Proof. By omitting those factors Δ^{a_i} where $a_i = 0$, we may assume that each a_i is positive. For $1 \leq i \leq n$, let $P_i \subseteq P$ denote the subset consisting of those simplices $\sigma \subseteq K$ such that the projection map $K \to \Delta^{a_i}$ does not carry σ to the final vertex of Δ^{a_i}. For $I \subseteq \{1, \ldots, n\}$, we let $P_I = \bigcap_{i \in I} P_i$. We will identify each $\mathrm{N}(P_I)$ with a simplicial subset of $\mathrm{N}(P)$. Note that $\mathrm{N}(P_I) = \bigcap_{i \in I} \mathrm{N}(P_i)$ and that $\mathrm{N}(P^0) = \bigcup_{1 \leq i \leq n} \mathrm{N}(P_i)$. It follows that $\mathrm{N}(P^0)$ can be identified with the homotopy colimit of the diagram $I \mapsto \mathrm{N}(P_I)$, where I ranges over the collection of nonempty subsets of $\{1, \ldots, n\}$. To complete the proof, it will suffice to show that each $\mathrm{N}(P_I)$ is weakly contractible.

For every nonempty subset $I \subseteq \{1, \ldots, n\}$, let K_I denote the product

$$\prod_{i \in I} \Delta^{a_i - 1} \times \prod_{i \notin I} \Delta^{a_i} \subseteq K.$$

Let Q_I denote the partially ordered collection of nondegenerate simplices of K_I. Then $\mathrm{N}(Q_I)$ is the barycentric subdivision of K_I, and therefore weakly contractible (since K_I is a product of simplices). The inclusion $\mathrm{N}(Q_I) \to \mathrm{N}(P_I)$ admits a right adjoint, which carries a simplex σ to its intersection with the simplicial subset $K_I \subseteq K$. It follows that $\mathrm{N}(P_I)$ is also weakly contractible, as desired. □

Lemma 6.3.6.2. *Let $S \to T$ be a surjective map of nonempty finite sets, let $\{\mathcal{C}_s\}_{s \in S}$ be a collection of differentiable pointed ∞-categories, $\{\mathcal{D}_t\}$ a collection of differentiable stable ∞-categories, and $\mathcal{E}$ a differentiable stable ∞-category. Suppose that we are given a collection of functors*

$$\{F_t : \prod_{s \in S_t} \mathcal{C}_s \to \mathcal{D}_t\}_{t \in T} \qquad G : \prod_{t \in T} \mathcal{D}_t \to \mathcal{E}\,.$$

Assume that each F_t commutes with sequential colimits, and that G commutes with sequential colimits and is exact in each variable. For each $t \in T$, let $\alpha_t : F_t \to D(F_t)$ be a map which exhibits $D(F_t)$ as a differential of F_t. Then the induced map

$$\alpha : G \circ \prod_{t \in T} F_t \to G \circ \prod_{t \in T} D(F_t)$$

exhibits $G \circ \prod_{t \in T} D(F_t)$ as a differential of $G \circ \prod_{t \in T} F_t$.

Proof. Since the functor G is reduced and right exact in each variable, we the canonical map $G \circ \prod_{t \in T} F_t \to G \circ \prod_{t \in T} \mathrm{cored}(F_t)$ exhibits $G \circ \prod_{t \in T} \mathrm{cored}(F_t)$ as a coreduction of $G \circ \prod_{t \in T} F_t$. We may therefore replace each F_t by $\mathrm{cored}(F_t)$ and thereby reduce to the case the functors F_t are reduced in each variable. Using Corollary 6.2.3.22, we can write each of the functors $D(F_t)$ as a composition

$$\prod_{s \in S_t} \mathcal{C}_s \overset{\Sigma^\infty}{\to} \prod_{s \in S_t} \mathrm{Sp}(\mathcal{C}_s) \overset{\vec{\partial}(F_t)}{\to} \mathrm{Sp}(\mathcal{D}_t) \simeq \mathcal{D}_t$$

小红书
小红书号:3189205503 qq

where $\vec{\partial}(F_t)$ is a multilinear functor, and the map α_t exhibits $\vec{\partial}(F_t)$ as a derivative of F_t. Let $\vec{\partial}G : \prod_{t\in T} \mathrm{Sp}(\mathcal{D}_t) \to \mathrm{Sp}(\mathcal{E})$ denote a derivative of G. Since the ∞-categories $\mathcal{D}_t$ and $\mathcal{E}$ are stable and the functor G is exact in each variable, the diagram

$$\begin{array}{ccc} \prod_{t\in T} \mathrm{Sp}(\mathcal{D}_t) & \xrightarrow{\vec{\partial}G} & \mathrm{Sp}(\mathcal{E}) \\ \downarrow{\scriptstyle \Omega^\infty} & & \downarrow{\scriptstyle \Omega^\infty} \\ \prod_{t\in T} \mathcal{D}_t & \longrightarrow & \mathcal{E} \end{array}$$

commutes (up to canonical homotopy). Using Theorem 6.2.1.22, we conclude that α exhibits the composite map

$$\prod_{s\in S} \mathrm{Sp}(\mathcal{C}_s) \overset{\prod \vec{\partial}(F_t)}{\to} \prod_{t\in T} \mathrm{Sp}(\mathcal{D}_t) \overset{\vec{\partial}G}{\to} \mathrm{Sp}(\mathcal{E})$$

as a derivative of $G \circ \prod_{t\in T} F_t$. It follows from Corollary 6.2.3.24 that α also exhibits $G \circ \prod_{t\in T} D(F_t)$ as a differential of $G \circ \prod_{t\in T} F_t$. □

Proof of Theorem 6.3.2.3. Let $q : \mathcal{C}^\otimes \to \Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ be a thin Δ^2-family of ∞-operads satisfying the following conditions:

(1) Each of the ∞-categories $\mathcal{C}_i$ is pointed and compactly generated.

(2) For every $i \leq j$, each of the induced functors $\mathcal{C}_i^n \to \mathcal{C}_j$ preserves final objects and filtered colimits.

(3) Let $i \in \Delta^2$ be a vertex and $\alpha : \langle m \rangle \to \langle n \rangle$ be an injective map of pointed finite sets. If $\overline{\alpha}$ is a locally q-coCartesian morphism in $\mathcal{C}^\otimes$ lifting the map $(i, \langle m \rangle) \to (i, \langle n \rangle)$ in $\Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$, then $\overline{\alpha}$ is q-coCartesian.

Let $U : \mathrm{Sp}(\mathcal{C})^\otimes \to \mathcal{C}^\otimes$ be a map which exhibits $\mathrm{Sp}(\mathcal{C})^\otimes$ as a stabilization of $\mathcal{C}^\otimes$. We wish to show that $\mathrm{Sp}(\mathcal{C})^\otimes$ is also a thin Δ^2-family of ∞-operads.

Let us regard the canonical map $U^{op} : (\mathrm{Sp}(\mathcal{C})^\otimes)^{op} \to (\mathcal{C}^\otimes)^{op}$ as giving a diagram $\upsilon : [1] \to \mathcal{S}\mathrm{et}_\Delta$, and let $\mathcal{M}$ denote the relative nerve $\mathrm{N}_\upsilon(\Delta^1)^{op}$ (see Definition HTT.3.2.5.2). We have a canonical map $u_0 : \mathcal{M} \to \Delta^1$, whose fibers are given by $\mathcal{M}_0 = \mathcal{C}^\otimes$, $\mathcal{M}_1 = \mathrm{Sp}(\mathcal{C})^\otimes$. Let $\upsilon_0 : [1] \to \mathcal{S}\mathrm{et}_\Delta$ be the constant functor taking the value $\Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$. Since the maps

$$\mathcal{C}^\otimes \to \Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*) \qquad \mathrm{Sp}(\mathcal{C})^\otimes \to \Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$$

are categorical fibrations, the map u_0 lifts to a categorical fibration

$$u : \mathcal{M} = \mathrm{N}_\upsilon(\Delta^1)^{op} \to \mathrm{N}_{\upsilon_0}(\Delta^1)^{op} \simeq \Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*) \times \Delta^1$$

(see Lemma HTT.3.2.5.11).

小红书 小红书号:3189205503 qq

For every object $A = (j, \langle n \rangle) \in \Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$, the forgetful functor $\mathrm{Sp}(\mathcal{C})^{\otimes}_A \to \mathcal{C}^{\otimes}_A$ can be identified with a product of n copies of the forgetful functor $\Omega^{\infty}_{\mathcal{C}_j} : \mathrm{Sp}(\mathcal{C}_j) \to \mathcal{C}_j$, and therefore admits a left adjoint $\Sigma^{\infty}_A : \mathcal{C}^{\otimes}_A \to \mathrm{Sp}(\mathcal{C})^{\otimes}_A$. It follows that u restricts to a coCartesian fibration $u_A : \mathcal{M}_A \to \{A\} \times \Delta^1$. In particular, for every object $X \in \mathcal{C}^{\otimes}_A$, we can choose a locally u-coCartesian morphism $\alpha : X \to \Sigma^{\infty}_A(X)$ in $\mathcal{M}$ which covers the canonical map $(A, 0) \to (A, 1)$ in $\Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*) \times \Delta^1$.

We first prove:

(i) Suppose we are given a locally q-coCartesian morphism $\beta : X' \to X$ in $\mathcal{C}^{\otimes}$, where $X \in \mathcal{C}^{\otimes}_A$ for some $A \in \Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$. Let $\alpha_X : X \to \Sigma^{\infty}_A(X)$ be defined as above. Then $\alpha_X \circ \beta$ is a locally u-coCartesian morphism in $\mathcal{M}$.

To prove (i), let $\beta_0 : A' \to A$ denote the image of β in $\Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$. Fix an object $Y \in \mathrm{Sp}(\mathcal{C})^{\otimes}_A$. Let $\mathrm{Map}^{\alpha_X \circ \beta}_{\mathcal{M}}(X', Y)$ denote the inverse image of $u(\alpha_X \circ \beta)$ in the mapping space $\mathrm{Map}_{\mathcal{M}}(X', Y)$. We wish to show that composition with $\alpha_X \circ \beta$ induces a homotopy equivalence

$$\xi : \mathrm{Map}_{\mathrm{Sp}(\mathcal{C})^{\otimes}_A}(\Sigma^{\infty}_A(X), Y) \to \mathrm{Map}^{\alpha_X \circ \beta}_{\mathcal{M}}(X', Y).$$

Using the definition of Σ^{∞}_A and of the ∞-category $\mathcal{M}$, we can identify ξ with the map

$$\mathrm{Map}_{\mathcal{C}^{\otimes}_A}(X, U(Y)) \to \mathrm{Map}^{\beta}_{\mathcal{C}^{\otimes}}(X', U(Y))$$

given by composition with β. The desired result now follows from the fact that β is locally q-coCartesian.

Using (i), we next prove the following:

(ii) The map $u : \mathcal{M} \to \Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*) \times \Delta^1$ is a locally coCartesian fibration.

To prove this, suppose we are given a morphism $\gamma_0 : (j', \langle n' \rangle, i') \to (j, \langle n \rangle, i)$ in $\Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*) \times \Delta^1$ and an object $X' \in \mathcal{M}$ lying over $(j', \langle n' \rangle, i')$. We wish to show that γ can be lifted to a locally u-coCartesian morphism $\gamma : X' \to Y$ in $\mathcal{M}$. If $i = i'$, then the desired result follows from the fact that $q : \mathcal{C}^{\otimes} \to \Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ and $(q \circ U) : \mathrm{Sp}(\mathcal{C})^{\otimes} \to \Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ are locally coCartesian fibrations. Let us therefore assume that $i' = 0$ and $i = 1$. In this case, γ_0 factors as a composition

$$(j', \langle n' \rangle, 0) \xrightarrow{\beta_0} (j, \langle n \rangle, 0) \xrightarrow{\alpha_0} (j, \langle n \rangle, 1).$$

Since q is a locally coCartesian fibration, we can choose a locally q-coCartesian morphism $\beta : X' \to X$ lifting β_0. Let $\alpha_X : X \to \Sigma^{\infty}_{(j, \langle n \rangle)} X$ be as above. It follows from (i) that the composition $\alpha_X \circ \beta$ is a locally u-coCartesian morphism lifting γ.

Fix an integer $n \geq 1$ and let $S = \{1, \ldots, n\}$. Let $T = \Delta^2 \mathrm{N}(\mathcal{F}\mathrm{in}_*)$. Then T contains objects $t = (0, \langle n \rangle)$ and $t' = (2, \langle 1 \rangle)$. Let $\chi : \mathrm{Part}(S) \to \mathbf{\Delta}^{t,t'}_T$ be as in Notation 6.3.2.11, and let $\theta : \mathrm{N}(\mathbf{\Delta}^{t,t'}_T) \to \mathrm{Fun}(\mathrm{Sp}(\mathcal{C})^{\otimes}_{(0, \langle n \rangle)}, \mathrm{Sp}(\mathcal{C})_2)$ be the spray associated to the locally coCartesian fibration

小红书 小红书号:3189205503 qq

$(q \circ U) : \mathrm{Sp}(\mathcal{C})^{\otimes} \to \mathrm{N}(\mathcal{F}\mathrm{in}_*) \times \Delta^2$. To prove that $\mathrm{Sp}(\mathcal{C})^{\otimes}$ is thin, we must show that the composite map

$$\phi : \mathrm{N}(\mathrm{Part}^0(S))^{\triangleleft} \simeq \mathrm{N}(\mathrm{Part}(S)) \xrightarrow{\chi} \mathrm{N}(\mathbf{\Delta}_T^{t,t'}) \xrightarrow{\theta} \mathrm{Fun}(\mathrm{Sp}(\mathcal{C})^{\otimes}_{(0,\langle n \rangle)}, \mathrm{Sp}(\mathcal{C})_2)$$

is a limit diagram in the ∞-category $\mathrm{Fun}(\mathrm{Sp}(\mathcal{C})^{\otimes}_{(0,\langle n \rangle)}, \mathrm{Sp}(\mathcal{C})_2)$. Note that ϕ takes values in the full subcategory of $\mathrm{Fun}(\mathrm{Sp}(\mathcal{C})^{\otimes}_{(0,\langle n \rangle)}, \mathrm{Sp}(\mathcal{C})_2)$ spanned by those maps which correspond to functors $\mathrm{Sp}(\mathcal{C}_0)^n \to \mathrm{Sp}(\mathcal{C}_2)$ which are excisive in each variable and commute with filtered colimits. Using Theorem 6.2.3.21, we are reduced to showing that the composite map

$$\phi' : \mathrm{N}(\mathrm{Part}(S)) \xrightarrow{\phi} \mathrm{Fun}(\mathrm{Sp}(\mathcal{C})^{\otimes}_{(0,\langle n \rangle)}, \mathrm{Sp}(\mathcal{C})_2) \to \mathrm{Fun}(\mathcal{C}_0^n, \mathrm{Sp}(\mathcal{C})_2)$$

is a limit diagram, where the second map is given by composition with the functor

$$\mathcal{C}_0^n \xrightarrow{\Sigma^{\infty}_{\mathcal{C}_0}} \mathrm{Sp}(\mathcal{C}_0)^n \simeq \mathrm{Sp}(\mathcal{C})^{\otimes}_{(0,\langle n \rangle)}.$$

Set $T^+ = \Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*) \times \Delta^1$, so that T^+ contains objects $t^+ = (0, \langle n \rangle, 0)$ and $t'^+ = (2, \langle 1 \rangle, 1)$. Let $\mathcal{U} \subseteq \mathrm{Equiv}(S)$ be a downward-closed subset (that is, if an equivalence relation E on S belongs to $\mathcal{U}$, then any finer equivalent relation also belongs to $\mathcal{U}$). We define a functor $\chi_{\mathcal{U}} : \mathrm{Part}(S) \to \mathbf{\Delta}_{T^+}^{t^+,t'^+}$ as follows. To every chain of equivalence relations $(E_1 \subseteq \cdots \subseteq E_k)$ on S, $\chi_{\mathcal{U}}$ assigns the $(k+1)$-simplex of T^+ given by the chain of morphisms

$$(0, \langle n \rangle, 0) \to (1, (S/E_1)_*, i_1) \to (1, (S/E_2)_*, i_2) \to \cdots \to (1, (S/E_k)_*, i_k) \to (2, \langle 1 \rangle, 1),$$

where

$$i_j = \begin{cases} 0 & \text{if } E_j \in \mathcal{U} \\ 1 & \text{if } E_j \notin \mathcal{U}\,. \end{cases}$$

Let $\chi' : \mathrm{Part}(S) \to \mathbf{\Delta}_{T^+}^{t^+,t'^+}$ be the functor which carries a chain of equivalence relations $(E_1 \subseteq \cdots \subseteq E_k)$ to the $(k+2)$-simplex of T^+ given by the chain of morphisms

$$(0, \langle n \rangle, 0) \to (0, \langle n \rangle, 1) \to (1, (S/E_1)_*, 1) \to (1, (S/E_2)_*, 1) \to \cdots \to (1, (S/E_k)_*, 1) \to (2, \langle 1 \rangle, 1),$$

Let $\theta^+ : \mathrm{N}(\mathbf{\Delta}_{T^+}^{t^+,t'^+}) \to \mathrm{Fun}(\mathcal{C}_0^n, \mathrm{Sp}(\mathcal{C})_2)$ be the functor obtained by combining the equivalence $\mathcal{C}_0^n \simeq \mathcal{C}^{\otimes}_{(0,\langle n \rangle)}$ with the spray associated to the locally coCartesian fibration u. Unwinding the definition, we can identify ϕ' with the composition $\theta^+ \circ \chi'$. For every downward closed subset $\mathcal{U} \subseteq \mathrm{Equiv}(S)$, we let $\phi_{\mathcal{U}}$ denote the composite map

$$\mathrm{N}(\mathrm{Part}(S)) \xrightarrow{\chi_{\mathcal{U}}} \mathrm{N}(\mathbf{\Delta}_{T^+}^{t^+,t'^+}) \xrightarrow{\theta^+} \mathrm{Fun}(\mathcal{C}_0^n, \mathrm{Sp}(\mathcal{C})_2).$$

Let $D : \mathrm{Fun}(\mathcal{C}_0^n, \mathrm{Sp}(\mathcal{C})_2) \to \mathrm{Exc}_*(\mathcal{C}_0^n, \mathrm{Sp}(\mathcal{C})_2)$ be a left adjoint to the inclusion, given by the differentiation construction described in §6.2.3. We have an evident natural transformation $\chi_{\emptyset} \to \chi'$ of functors from $\mathrm{Part}(S)$ into $\mathbf{\Delta}_{T^+}^{t^+,t'^+}$, which induces a natural transformation $\iota : \phi_{\emptyset} \to \phi'$. Since ϕ'

小红书
小红书号:3189205503 qq

takes values in the full subcategory $\mathrm{Exc}_*(\mathcal{C}_0^n, \mathrm{Sp}(\mathcal{C})_2)$, ι induces a map $D \circ \phi_\emptyset \to \phi'$. Using Lemma 6.3.6.2, we deduce that this map is an equivalence: that is, for every chain of equivalence relations $\vec{E} = (E_1 \subseteq \cdots \subseteq E_k) \in \mathrm{Part}(S)$, the map $\iota_{\vec{E}} : \phi_\emptyset(\vec{E}) \to \phi'(\vec{E})$ exhibits $\phi'(\vec{E})$ as a differential of $\phi_\emptyset(\vec{E})$. We will deduce that ϕ' is a limit diagram from the following more general assertion:

(*iii*) For every downward-closed $\mathcal{U} \subseteq \mathrm{Equiv}(S)$, the composition $D \circ \phi_{\mathcal{U}}$ determines a limit diagram

$$\mathrm{N}(\mathrm{Part}(S)) \to \mathrm{Exc}_*(\mathcal{C}_0^n, \mathrm{Sp}(\mathcal{C})_2).$$

The proof of (*iii*) proceeds by descending induction on the cardinality of $\mathcal{U}$. Our base case is the following:

(*iv*) If $\mathcal{U} = \mathrm{Equiv}(S)$, then the functor $D \circ \phi_{\mathcal{U}}$ determines a limit diagram $\mathrm{N}(\mathrm{Part}(S)) \to \mathrm{Exc}_*(\mathcal{C}_0^n, \mathrm{Sp}(\mathcal{C})_2)$.

To carry out the inductive step, we will prove the following:

(*v*) Let $\mathcal{U} \subsetneq \mathrm{Equiv}(S)$ be a proper downward closed subset. Let E be an equivalence relation on S which is minimal among those elements which does not belong to $\mathcal{U}$, let $\mathcal{U}' = \mathcal{U} \cup \{E\}$, and assume that $D \circ \phi_{\mathcal{U}'}$ is a limit diagram in $\mathrm{Exc}_*(\mathcal{C}_0^n, \mathrm{Sp}(\mathcal{C})_2)$. Then $D \circ \phi_{\mathcal{U}}$ is a limit diagram in $\mathrm{Exc}_*(\mathcal{C}_0^n, \mathrm{Sp}(\mathcal{C})_2)$.

We now prove (*iv*). Let $\theta^- : \mathrm{N}(\mathbf{\Delta}_T^{t,t'}) \to \mathrm{Fun}(\mathcal{C}^{\otimes}_{\langle n \rangle, 0}, \mathcal{C}_2)$ be the spray associated to the locally coCartesian fibration $q : \mathcal{O}^{\otimes} \to T$, and let $\Sigma^\infty_{\mathcal{C}_2} : \mathcal{C}_2 \to \mathrm{Sp}(\mathcal{C})_2$ be a left adjoint to the functor $\mathrm{Sp}(\mathcal{C})_2 \to \mathcal{C}_2$ determined by p. Using (*i*), we deduce that $\phi_{\mathrm{Equiv}(S)}$ is equivalent to the composition

$$\mathrm{N}(\mathrm{Part}(S)) \xrightarrow{\psi} \mathrm{Fun}(\mathcal{C}_0^n, \mathcal{C}_2) \xrightarrow{\Sigma^\infty_{\mathcal{C}_2} \circ} \mathrm{Fun}(\mathcal{C}_0^n, \mathrm{Sp}(\mathcal{C})_2),$$

where ψ denotes the composition

$$\mathrm{N}(\mathrm{Part}(S)) \xrightarrow{\chi} \mathrm{N}(\mathbf{\Delta}_T^{t,t'}) \xrightarrow{\theta^-} \mathrm{Fun}(\mathcal{C}^{\otimes}_{\langle n \rangle, 0}, \mathcal{C}_2) \simeq \mathrm{Fun}(\mathcal{C}_0^n, \mathcal{C}_2).$$

Let $D' : \mathrm{Fun}(\mathcal{C}_0^n, \mathcal{C}_2) \to \mathrm{Exc}_*(\mathcal{C}_0^n, \mathcal{C}_2)$ be a left adjoint to the inclusion. The commutative diagram of ∞-categories

$$\begin{array}{ccc} \mathrm{Exc}_*(\mathcal{C}_0^n, \mathrm{Sp}(\mathcal{C})_2) & \xrightarrow{\Omega^\infty_{\mathcal{C}_2} \circ} & \mathrm{Exc}_*(\mathcal{C}_0^n, \mathcal{C}_2) \\ \downarrow & & \downarrow \\ \mathrm{Fun}(\mathcal{C}_0^n, \mathrm{Sp}(\mathcal{C})_2) & \xrightarrow{\Omega^\infty_{\mathcal{C}_2} \circ} & \mathrm{Fun}(\mathcal{C}_0^n, \mathcal{C}_2) \end{array}$$

determines a commutative diagram of left adjoint functors

$$\begin{array}{ccc} \mathrm{Exc}_*(\mathcal{C}_0^n, \mathrm{Sp}(\mathcal{C})_2) & \longleftarrow & \mathrm{Exc}_*(\mathcal{C}_0^n, \mathcal{C}_2) \\ {\scriptstyle D}\uparrow & & \uparrow{\scriptstyle D'} \\ \mathrm{Fun}(\mathcal{C}_0^n, \mathrm{Sp}(\mathcal{C})_2) & \xleftarrow[\Sigma^\infty_{\mathcal{C}_2} \circ]{} & \mathrm{Fun}(\mathcal{C}_0^n, \mathcal{C}_2), \end{array}$$

小红书 小红书号:3189205503 qq

where the upper horizontal map is an equivalence by virtue of Proposition 1.4.2.22. Consequently, to show that $D \circ \phi_{\mathrm{Equiv}(S)} \simeq D \circ \Sigma^{\infty}_{\mathcal{C}_2}(\psi)$ is a limit diagram in $\mathrm{Exc}_*(\mathcal{C}_0^n, \mathrm{Sp}(\mathcal{C})_2)$, it will suffice to show that $D' \circ \psi$ is limit diagram in $\mathrm{Exc}_*(\mathcal{C}_0^n, \mathcal{C}_2)$. Using Corollary 6.2.3.24, we are reduced to proving that the diagram $\vec{\partial} \circ \psi$ is a limit diagram in $\mathrm{Exc}_*(\mathrm{Sp}(\mathcal{C}_0)^n, \mathrm{Sp}(\mathcal{C})_2)$. We will prove this by verifying the hypotheses of Theorem 6.3.5.5. Fix an equivalence relation E on S. We let $\mathrm{Equiv}_E(S)$ denote the subset of $\mathrm{Equiv}(S)$ spanned by those equivalence relations E' on S which refine E. We have a canonical isomorphism of partially ordered sets

$$\mathrm{Equiv}_E(S) = \prod_{S' \in S/E} \mathrm{Equiv}(S'),$$

where the product is taken over all equivalence classes in S (which we regard as subsets of S). The inclusion $\mathrm{Equiv}_E(S) \hookrightarrow \mathrm{Equiv}(S)$ admits a right adjoint, which we can identify with the map

$$\eta : \mathrm{Equiv}(S) \to \prod_{S' \in S/E} \mathrm{Equiv}(S')$$

given by restricting an equivalence relation on S to each of the subsets $S' \in S/E$. Composing with η gives a map $\gamma : \mathrm{Part}(S) \to \prod_{S' \in S/E} \mathrm{Part}(S')$. We first verify:

(*a*) The map u restricts to a right cofinal map $\mathrm{Part}^0(S) \to \prod_{S' \in S/E} \mathrm{Part}^0(S')$. According to Theorem HTT.4.1.3.1 , this is equivalent to the assertion that for every element $\{X_{S'}\}_{S' \in S/E} \in \prod_{S' \in S/E} \mathrm{Part}^0(S')$, the partially ordered set $P = \{X \in \mathrm{Part}^0(S) : \gamma(X) \leq \{X_{S'}\}\}$ has weakly contractible nerve.

We can identify each $X_{S'}$ with a nondegenerate simplex in $\mathrm{N}(\mathrm{Equiv}(S'))$. Unwinding the definitions, we see that the simplicial set $\mathrm{N}(P)$ is isomorphic to the barycentric subdivision of the simplicial set $Q = \mathrm{N}(\mathrm{Equiv}(S)) \times_{\prod_{S' \in S/E} \mathrm{N}(\mathrm{Equiv}(S'))} \prod_{S' \in S/E} X_{S'}$, which is a full subcategory of $\mathrm{N}(\mathrm{Equiv}(S))$. Let Q_0 denote the full subcategory of Q spanned by those equivalence relations on S which refine E. The inclusion $Q_0 \hookrightarrow Q$ admits a right adjoint and is therefore a weak homotopy equivalence. We are therefore reduced to proving that Q_0 is weakly contractible. It now suffices to observe that the projection map $Q_0 \to \prod_{S' \in S/E} X_{S'}$ is an isomorphism, so that Q_0 is a product of simplices.

For each $S' \in S/E$, let $t_{S'} = (0, S'_*) \in T$, let $\theta_{S'} : \mathrm{N}(\mathbf{\Delta}_T^{t_{S'}, t'}) \to \mathrm{Fun}(\mathcal{C}^{\otimes}_{(0,S'_*)}, \mathcal{C}_2)$ be the spray associated to the locally coCartesian fibration q. Composing with the functor $\mathrm{Part}(S') \to \mathrm{N}(\mathbf{\Delta}_T^{t_{S'}, t'})$ and using the identification $\mathcal{C}^{\otimes}_{(0,S'_*)} \simeq \mathcal{C}_0^{S'}$, we obtain a map $\psi^{S'} : \mathrm{N}(\mathrm{Part}(S')) \to \mathrm{Fun}(\mathcal{C}_0^{S'}, \mathcal{C}_2)$. Using (3), we see that the composite map

$$\mathrm{N}(\mathrm{Part}(S)) \to \mathrm{N}(\mathrm{Part}(S')) \xrightarrow{\psi^{S'}} \mathrm{Fun}(\mathcal{C}_0^{S'}, \mathcal{C}_2)$$

小红书
小红书号:3189205503 qq

is given by composing the functor $\psi : \mathrm{N}(\mathrm{Part}(S)) \to \mathrm{Fun}(\mathcal{C}_0^S, \mathcal{C}_2)$ with the map $\mathrm{Fun}(\mathcal{C}_0^S, \mathcal{C}_2) \to \mathrm{Fun}(\mathcal{C}_0^E, \mathcal{C}_2)$ determined by the inclusion

$$\mathcal{C}_0^{S'} \simeq \prod_{s \in S'} \mathcal{C}_0 \times \prod_{s \in S - S'} \{*\} \subseteq \mathcal{C}_0^n,$$

where $*$ denotes a zero object of $\mathcal{C}_0$ (see Remark 6.3.2.4).

To complete the verification of the hypotheses of Theorem 6.3.5.5, it suffices to observe the following:

(b) Each of the functors $\psi^{S'} \to \mathrm{N}(\mathrm{Part}(S')) \to \mathrm{Fun}(\mathcal{C}_0^{S'}, \mathcal{C}_2)$ is a limit diagram.

This follows immediately from our assumption that the corepresentable Δ^2-family of ∞-operads $\mathcal{O}^{\otimes} \to \mathrm{N}(\mathcal{F}\mathrm{in}_*) \times \Delta^2$ is thin.

We now prove (v). Let $\mathcal{U} \subsetneq \mathrm{Equiv}(S)$ be a downward closed subset, let E be a minimal element of $\mathrm{Equiv}(S) - \mathcal{U}$, let $\mathcal{U}' = \mathcal{U} \cup \{E\}$, and assume that $D \circ \phi_{\mathcal{U}'}$ is a limit diagram. We wish to prove that $D \circ \phi_{\mathcal{U}}$ is a limit diagram. We define a functor

$$\chi_{\mathcal{U},\mathcal{U}'} : \mathrm{Part}(S) \to \mathbf{\Delta}_{T^+}^{t^+,t'^+}$$

as follows. If $\vec{E} = (E_1 \subseteq \cdots \subseteq E_k)$ is a chain of equivalence relations on S which does not contain the equivalence relation E, then we set $\chi_{\mathcal{U},\mathcal{U}'}(\vec{E}) = \chi_{\mathcal{U}}(\vec{E}) = \chi_{\mathcal{U}'}(\vec{E})$. Otherwise, there is a unique integer $p \leq k$ such that $E_p = E$. We define $\chi_{\mathcal{U},\mathcal{U}'}(J)$ to be the simplex of T^+ given by the chain of morphisms

$$\begin{aligned}
(0, \langle n \rangle, 0) &\to (1, (S/E_1)_*, 0) \\
&\to \cdots \\
&\to (1, (S/E_p)_*, 0) \\
&\to (1, (S/E_p)_*, 1) \\
&\to \cdots \\
&\to (1, (S/E_k)_*, 1) \\
&\to (2, \langle 1 \rangle, 1).
\end{aligned}$$

Composing with θ^+, we obtain a functor $\phi_{\mathcal{U},\mathcal{U}'} : \mathrm{N}(\mathrm{Part}(S)) \to \mathrm{Fun}(\mathcal{C}_0^n, \mathrm{Sp}(\mathcal{C})_2)$. Moreover, we have evident natural transformations $\chi_{\mathcal{U}} \to \chi_{\mathcal{U},\mathcal{U}'} \leftarrow \chi_{\mathcal{U}'}$, which induce natural transformations

$$\phi_{\mathcal{U}} \xrightarrow{\epsilon} \phi_{\mathcal{U},\mathcal{U}'} \xleftarrow{\epsilon'} \phi_{\mathcal{U}'}.$$

Using (i), we deduce that the map ϵ is an equivalence. Consequently, to complete the proof of (v), it will suffice to show that $D \circ \phi_{\mathcal{U},\mathcal{U}'}$ is a limit diagram.

小红书
小红书号:3189205503 qq

Let $P \subseteq [1] \times \mathrm{Part}(S)$ be the subset consisting of those pairs $(i, \vec{E})$ where either $i = 0$ or $\vec{E}$ contains E. We define a map $\chi_P : P \to \mathbf{\Delta}^{t^+, t'^+}_{T^+}$ by the formula

$$\chi_P(i, \vec{E}) = \begin{cases} \chi_{\mathcal{U},\mathcal{U}'}(\vec{E}) & \text{if } i = 1 \\ \chi_{\mathcal{U}'}(\vec{E}) & \text{otherwise.} \end{cases}$$

Note that composition with θ^+ determines a map $\phi_P : \mathrm{N}(P) \to \mathrm{Fun}(\mathcal{C}_0^n, \mathrm{Sp}(\mathcal{C})_2)$. Let P^0 denote the partially ordered subset of P obtained by removing the least element $(0, \emptyset)$. By assumption, the restriction of $D \circ \phi_P$ to $\mathrm{N}(\{0\} \times \mathrm{Part}(S))$ is a limit diagram. The inclusion $\mathrm{N}(\{0\} \times \mathrm{Part}^0(S)) \hookrightarrow \mathrm{N}(P^0)$ admits a right adjoint (given by the projection $P^0 \to \mathrm{Part}^0(S)$) and is therefore right cofinal. It follows that $D \circ \phi_P$ is a limit diagram.

Define partially ordered subsets $P'' \subseteq P' \subseteq P$ as follows:

- A pair $(i, \vec{E}) \in P$ belongs to P' if either $i = 1$ or $\vec{E}$ does not contain E as a least element.
- A pair $(i, \vec{E}) \in P$ belongs to P'' if either $i = 1$ or $\vec{E}$ does not contain E.

Set $P'^0 = P' \cap P^0$ and $P''^0 = P'' \cap P^0$. Note that the projection map $P'' \to \mathrm{Part}(S)$ is an isomorphism of partially ordered sets, and that the restriction of ϕ_P to $\mathrm{N}(P'')$ coincides with $\phi_{\mathcal{U},\mathcal{U}'}$. To complete the proof, it will suffice to show that the restriction of $D \circ \phi_P$ to $\mathrm{N}(P'')$ is a limit diagram. The inclusion $\mathrm{N}(P''^0) \to \mathrm{N}(P'^0)$ admits a right adjoint (given by $(i, \vec{E}) \mapsto \begin{cases} (0, \vec{E} - \{E\}) & \text{if } i = 0 \\ (1, \vec{E}) & \text{if } i = 1. \end{cases}$), and is therefore right cofinal. We are therefore reduced to proving that the restriction of $D \circ \phi_P$ to $\mathrm{N}(P')$ is a limit diagram. Since $D \circ \phi_P$ is a limit diagram, this is a consequence of the following assertion:

(vi) The diagram $D \circ \phi_P$ is a right Kan extension of its restriction to $\mathrm{N}(P')$.

To prove (vi), fix an object $(0, \vec{E}) \in P - P'$; we will show that $D \circ \phi_P$ is a right Kan extension of $(D \circ \phi_P)|\mathrm{N}(P')$ at $(0, \vec{E})$. We can identify $\vec{E}$ with a chain of equivalence relations

$$E = E_0 \subseteq E_1 \subseteq \cdots \subseteq E_k$$

on S. Let $P'_{\geq \vec{E}} = \{(i, \vec{E}') \in P' : \vec{E} \subseteq \vec{E}'\}$. We wish to prove that the canonical map

$$D(\phi_P(0, \vec{E})) \to \varprojlim_{(i, \vec{E}') \in P'_{\geq \vec{E}'}} D(\phi_P(i, \vec{E}'))$$

is an equivalence. Let $Q \subseteq P'_{\geq \vec{E}}$ be the partially ordered subset spanned by those pairs $(i, \vec{E}')$, where $\vec{E}' \cap \{E' \in \mathrm{Equiv}(S) : E \subseteq E'\} = \vec{E}$. The construction $(i, \vec{E}') \mapsto (i, \vec{E}' - \{E' \in \mathrm{Equiv}(S) : E \subseteq E' \notin$

小红书号:3189205503 qq

$\vec{E}\}$) determines a right adjoint to the inclusion $Q \hookrightarrow P'_{\geq \vec{E}}$, so that the inclusion $\mathrm{N}(Q) \to \mathrm{N}(P'_{\geq \vec{E}})$ is right cofinal. It will therefore suffice to prove that the canonical map

$$D(\phi_P(0, \vec{E})) \to \varprojlim_{(i,\vec{E}') \in Q} D(\phi_P(i, \vec{E}'))$$

is an equivalence.

Let $\mathrm{Part}'(S)$ denote the subset of $\mathrm{Part}(S)$ consisting of those linearly ordered subsets of $\mathrm{Equiv}(S)$ which contain E as a largest element. The construction $\vec{E}' \mapsto \vec{E}' \cup \vec{E}$ induces a bijection from $\mathrm{Part}'(S)$ to the subset of $\mathrm{Part}(S)$ consisting of those chains which contain $\vec{E}$ as a final segment. Let $\mathrm{Part}'^0(S)$ denote the subset of $\mathrm{Part}'(S)$ consisting of linearly ordered subsets which have at least two elements. Unwinding the definitions, we are reduced to proving that the diagram σ :

$$\begin{array}{ccc} D\phi_P(0, \vec{E}) & \longrightarrow & \varprojlim_{\vec{E}' \in \mathrm{Part}'^0(S)} D\phi_P(0, \vec{E}' \cup \vec{E}) \\ \downarrow & & \downarrow \\ D\phi_P(1, \vec{E}) & \longrightarrow & \varprojlim_{\vec{E}' \in \mathrm{Part}'^0(S)} D\phi_P(1, \vec{E}' \cup \vec{E}) \end{array}$$

is a pullback square in the ∞-category $\mathrm{Fun}(\mathcal{C}_0^n, \mathrm{Sp}(\mathcal{C})_2)$.

Let t'' denote the vertex $(1, (S/E)_*)$ of $\Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$. The locally coCartesian fibration $q : \mathcal{C}^{\otimes} \to \Delta^2 \times \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ determines a spray $\hat{\theta} : \mathrm{N}(\mathbf{\Delta}_T^{t,t''}) \to \mathrm{Fun}(\mathcal{C}^{\otimes}_{(0,\langle n \rangle)}, \mathcal{C}^{\otimes}_{(1,(S/\sim)_*)})$. Let $\chi'' : \mathrm{Part}'(S) \to \mathbf{\Delta}_T^{t,t''}$ be the map which carries a chain of equivalence relations

$$E'_0 \subseteq E'_1 \subseteq \cdots \subseteq E'_{k'} = E$$

to the simplex corresponding to the chain of maps

$$t = (0, \langle n \rangle) \to (1, (S/E'_0)_*) \to \cdots \to ((S/E'_{k'})_*, 1).$$

Composing χ'' and $\hat{\theta}$ and using the identifications $\mathcal{C}^{\otimes}_{(0,\langle n \rangle)} \simeq \mathcal{C}_0^n$ and $\mathcal{C}^{\otimes}_{(1,(S/E)_*)} \simeq \mathcal{C}_1^{S/E}$, we we obtain a diagram $\psi_E : \mathrm{N}(\mathrm{Part}'(S)) \to \mathrm{Fun}(\mathcal{O}_0^n, \mathcal{O}_1^{S/E})$.

For every nonempty subset $S' \subseteq S$, let $E_{S'}$ denote the restriction of the equivalence relation E to S', and let $\mathrm{Part}'(S')$ denote the subset of $\mathrm{Part}(S')$ consisting of those linearly ordered subsets of $\mathrm{Equiv}(E)$ which contain $E_{S'}$ as a maximal element. Consider the vertices $t_{S'} = (0, S'_*)$ and $t''_{S'} = (1, \langle 1 \rangle)$ of T, and let $\hat{\theta}_{S'} : \mathrm{N}(\mathbf{\Delta}_T^{t_E, t''_E}) \to \mathrm{Fun}(\mathcal{C}^{\otimes}_{(0,S'_*)}, \mathcal{C}_1)$ be the spray associated to the locally coCartesian fibration $q : \mathcal{C}^{\otimes} \to T$. Let $\chi_{S'} : \mathrm{Part}'(S') \to \mathbf{\Delta}_T^{t_E, t''_E}$ be the functor which carries a chain of equivalence relations

$$E'_0 \subseteq E'_1 \subseteq \cdots \subseteq E'_{k'}$$

to the simplex given by the chain of maps

$$t_E = (0, S'_*) \to (1, (S'/E'_0)_*) \to \cdots \to (1, (S'/E'_{k'})_*).$$

小红书
小红书号:3189205503 qq

Composing $\chi_{S'}$ and $\theta_{S'}$, we obtain a functor $\psi_{S'} : \mathrm{N}(\mathrm{Part}'(S')) \to \mathrm{Fun}(\mathcal{C}_0^{S'}, \mathcal{C}_1)$. The inclusion $S' \hookrightarrow S$ determines a map $\mathrm{Equiv}(S) \to \mathrm{Equiv}(S')$, which induces a restriction map $r_{S'} : \mathrm{Part}'(S) \to \mathrm{Part}'(S')$. Unwinding the definitions, we see that ψ_E is equivalent to the composition

$$\mathrm{N}(\mathrm{Part}'(S)) \overset{\prod_{S' \in S/E} r_{S'}}{\longrightarrow} \prod_{S' \in S/E} \mathrm{N}(\mathrm{Part}'(S')) \overset{\prod_{S' \in S/E} \psi_{S'}}{\longrightarrow} \prod_{S' \in S/E} \mathrm{Fun}(\mathcal{C}_0^{S'}, \mathcal{C}_1) \to \mathrm{Fun}(\mathcal{C}_0^n, \mathcal{C}_1^{S/E}).$$

We now divide the proof into two cases. Suppose first that $k = 0$, so that $\vec{E} = \{E\}$. The edge $(1, (S/E)_*) \to (2, \langle 1 \rangle)$ of T determines a functor $G : \mathcal{C}_1^{S/E} \to \mathcal{C}_2$. Unwinding the definitions, we obtain canonical equivalences

$$\phi_P(0, \vec{E}' \cup \vec{E}) \simeq \Sigma^\infty_{\mathcal{C}_2} \circ G \circ \prod_{S' \in S/E} \psi_{S'}(r_{S'} \vec{E}')$$

$$\phi_P(1, \vec{E}' \cup \vec{E}) \simeq \vec{\partial}(G) \circ \prod_{S' \in S/E} \Sigma^\infty_{\mathcal{C}_1} \circ \psi_{S'}(r_{S'} \vec{E}').$$

To prove that σ is a pullback diagram, it will suffice to show that the square

$$\begin{array}{ccc} \vec{\partial}(G \circ \prod_{S' \in S/E} (\psi_{S'} \circ r'_S)(\{E\})) & \longrightarrow & \varprojlim_{\vec{E}' \in \mathrm{Part}'^0(S)} \vec{\partial}(G \circ \prod_{S' \in S/E} (\psi_{S'} \circ r_{S'})(\vec{E})) \\ \downarrow & & \downarrow \\ \vec{\partial}(G) \circ \prod_{S' \in S/E} \vec{\partial}((\psi_{S'} \circ r_{S'})(\{E\})) & \longrightarrow & \varprojlim_{\vec{E}' \in \mathrm{Part}'^0(S)} \vec{\partial}(G) \circ \prod_{S' \in S/E} \vec{\partial}(\psi_{S'} \circ r_{S'})(\vec{E}) \end{array}$$

is a pullback square in $\mathrm{Exc}_*(\mathrm{Sp}(\mathcal{C}_0)^n, \mathrm{Sp}(\mathcal{C}_2))$. We will deduce this from Theorem 6.3.5.6.

Choose an equivalence relation $E' \subsetneq E$ on S. If $S' \subseteq S$, we let $E'_{S'}$ denote the restriction of the equivalence relation E' to S'. Unwinding the definitions, we see that for each $S' \in S/E$ and each $\vec{E} \in \mathrm{Part}'(S)$, the functor $(\psi_{S'} \circ r_{S'})(\vec{E}')^{E'_{S'}}$ canonically equivalent to the composition

$$\mathcal{C}_0^{S'} \simeq \prod_{S'' \in S'/E'_{S'}} \mathcal{C}_0^{E'} \overset{\prod (\psi_{S''} \circ r_{S''})(\vec{E}')}{\to} \mathcal{C}_1^{S'/E'_{S'}} \overset{\times}{\to} \mathcal{C}_1,$$

where the final functor is given by the iterated product. To satisfy the hypotheses of Theorem 6.3.5.6, it will suffice to verify the following:

(*vii*) The restriction maps $r_{S''}$ determine a right cofinal map $\mathrm{N}(\mathrm{Part}'^0(S)) \to \prod_{S'' \in S/E'} \mathrm{N}(\mathrm{Part}'(S''))$.

Fix elements $\{\vec{E}'_{S''} \in \mathrm{Part}'(S'')\}$ for $S'' \in S/E'$. Let $\mathrm{Part}''^0(S)$ denote the subset of $\mathrm{Part}'^0(S)$ consisting of those elements $\vec{E}'$ such that $r_{S''}(\vec{E}') \subseteq \vec{E}'_{S'}$ for $S'' \in S/E'$. According to Theorem HTT.4.1.3.1 , it will suffice to show that the partially ordered set $\mathrm{Part}''^0(S)$ has weakly contractible nerve.

小红书 小红书号:3189205503 qq

Let $\mathrm{Equiv}_E(S)$ denote the subset of $\mathrm{Equiv}(S)$ consisting of equivalence relations which refine E, and define $\mathrm{Equiv}_{E'}(S) \subseteq \mathrm{Equiv}_E(S)$ similarly. For every downward-closed subset $\mathcal{V} \subseteq \mathrm{Equiv}_E(S) - (\{E\} \cup \mathrm{Equiv}_{E'}(S))$, we let $\mathrm{Part}''^0_{\mathcal{V}}(S)$ denote the subset of $\mathrm{Part}''^0(S)$ consisting of those linearly ordered subsets $\vec{E}' \subseteq \mathrm{Equiv}(S)$ which do not intersect $\mathcal{V}$. We will prove that $\mathrm{Part}''^0_{\mathcal{V}}(S)$ has weakly contractible nerve by descending induction on the cardinality of $\mathcal{V}$. Taking $\mathcal{V} = \emptyset$, this will complete the proof of (vi). We first treat the base case $\mathcal{V} = \mathrm{Equiv}_E(S) - (\{E\} \cup \mathrm{Equiv}_{E'}(S))$ Let R denote the subset of $\mathrm{Part}''^0_{\mathcal{V}}(S)$ consisting of those subsets $\vec{E}' \subseteq \mathrm{Equiv}(S)$ which contain E'. The inclusion $R \subseteq \mathrm{Part}''^0_{\mathcal{V}}(S)$ admits a left adjoint, given by $\vec{E}' \mapsto \vec{E}' \cup \{E'\}$. It will therefore suffice to show that $\mathrm{N}(R)$ is weakly contractible. This is clear, since R contains a least element (given by the linearly ordered subset $\{E' \subsetneq E\} \subseteq \mathrm{Equiv}(S)$).

We now carry out the inductive step. Assume that $\mathrm{Part}''^0_{\mathcal{V}}(S)$ has weakly contractible nerve for some nonempty subset $\mathcal{V} \subseteq \mathrm{Equiv}_E(S) - (\{E\} \cup \mathrm{Equiv}_{E'}(S))$. Let E'' be a maximal element of $\mathcal{V}$ and let $\mathcal{V}' = \mathcal{V} - \{E''\}$. We will prove that $\mathrm{Part}''^0_{\mathcal{V}'}(S)$ has weakly contractible nerve by showing that the inclusion

$$i : \mathrm{N}(\mathrm{Part}''^0_{\mathcal{V}}(S)) \hookrightarrow \mathrm{N}(\mathrm{Part}''^0_{\mathcal{V}'}(S))$$

is a weak homotopy equivalence. Let R denote the subset of $\mathrm{Part}''^0_{\mathcal{V}'}(S)$ consisting of those linearly ordered subsets $\vec{E}' \subseteq \mathrm{Equiv}(S)$ with the following property: if E'' belongs to $\vec{E}'$, then the common refinement $E' \cap E''$ belongs to $\vec{E}'$. Then the inclusion map i factors as a composition

$$\mathrm{N}(\mathrm{Part}''^0_{\mathcal{V}}(S)) \overset{i'}{\hookrightarrow} \mathrm{N}(R) \overset{i''}{\hookrightarrow} \mathrm{N}(\mathrm{Part}''^0_{\mathcal{V}'}(S)).$$

Here i' admits a right adjoint and i'' admits a left adjoint. It follows that i' and i'' are weak homotopy equivalences, so that i is a weak homotopy equivalence. This completes the proof of (vii).

We now return to the proof of (vi) in the case where $k > 0$. Let $W = S/E_1$. Given an element $w \in W$, let S_w denote its inverse image in S and let E_w be the restriction of E to S_w. The map of pointed finite sets $(S/E)_* \to W_*$ determines functors

$$G_w : \prod_{E \in S_w/E} \mathcal{C}_1 \to \mathcal{C}_1$$

. Let $H : \mathrm{Sp}(\mathcal{C})_1^W \to \mathrm{Sp}(\mathcal{C})_2$ be the functor given by the composition

$$\mathrm{Sp}(\mathcal{C})_1^{S/E_1} \to \mathrm{Sp}(\mathcal{C})_1^{S/E_2} \to \cdots \to \mathrm{Sp}(\mathcal{C})_1^{S/\sim_k} \to \mathrm{Sp}(\mathcal{C})_2$$

determined by $\vec{E}$. Unwinding the definitions, we obtain canonical equivalences

$$\phi_P(0, \vec{E}' \cup \vec{E}) \simeq H \circ \prod_{w \in W} (\Sigma^\infty_{\mathcal{C}_1} \circ G_w) \circ \prod_{S' \in S_w/E_w} \psi_{S'}(r_{S'} \vec{E}')$$

$$\phi_P(1, \vec{E}' \cup \vec{E}) \simeq H \circ \prod_{w \in W} (\vec{\partial}(G_w)) \circ \prod_{S' \in S_w/E_w} \Sigma^\infty_{\mathcal{C}_1} \circ \circ \psi_{S'}(r_{S'}(\vec{E}))$$

小红书
小红书号:3189205503 qq

for $\vec{E}' \in \mathrm{Part}'(S)$. Since $\mathrm{Sp}(\mathcal{C})^{\otimes}$ is a stable Δ^2-family of ∞-operads, the functor H is exact in each variable. Using Lemma 6.3.6.2 and Corollary 6.2.3.24, we see that σ is a pullback diagram if and only if the diagram

$$\begin{array}{ccc} & H \circ \prod_{w \in W} \vec{\partial}(G_w \circ \prod_{S' \in S_w/E_w} (\psi_{S'} \circ r_{S'})(\{E\})) & \\ \swarrow & & \searrow \\ \varprojlim_{\vec{E}' \in \mathrm{Part}'^0(S)} H \circ \prod_{w \in W} \vec{\partial}(G_w \circ \prod_{S' \in S_w/E_w} (\psi_{S'} \circ r_{S'})(\vec{E})) & & \\ & \searrow & H \circ \prod_{w \in W} \vec{\partial}(G_w) \circ \prod_{S' \in S_w/E_w} \vec{\partial}(\psi_{S'} \circ r_{S'})(\{E\}) \\ & & \swarrow \\ & \varprojlim_{\vec{E}' \in \mathrm{Part}'^0(S)} H \circ \prod_{w \in W} \vec{\partial}(G_w) \circ \prod_{S' \in S_w/E_w} \vec{\partial}(\psi_E \circ r_E)(I) & \end{array}$$

is a pullback square in $\mathrm{Exc}_*(\mathrm{Sp}(\mathcal{C})_0^n, \mathrm{Sp}(\mathcal{C})_2)$.

Define $F, F' : \mathrm{N}(\mathrm{Part}'(S)) \to \mathrm{Exc}_*(\mathrm{Sp}(\mathcal{C})_0^n, \mathrm{Sp}(\mathcal{C})_2)$ by the formulae

$$F(\vec{E}) = H \circ \prod_{w \in W} \vec{\partial}(G_w \circ \prod_{S' \in S_w/E_w} (\psi_{S'} \circ r_{S'})(\vec{E})) \qquad F'(\vec{E}) = H \circ \prod_{w \in W} \vec{\partial}(G_w) \circ \prod_{S' \in S_w/E_w} \mathrm{Diff}(\psi_{S'} \circ r_{S'})(\vec{E}).$$

We wish to prove that the evident natural transformation $F \to F'$ induces an equivalence $\mathrm{tfib}(F) \to \mathrm{tfib}(F')$ in the stable ∞-category $\mathrm{Exc}_*(\mathrm{Sp}(\mathcal{C})_0^n, \mathrm{Sp}(\mathcal{C})_2)$. To study this map, we need the following observation:

(*viii*) Let $(\prod_{w \in W} \mathrm{Part}'(S_w))^0$ denote the subset of $(\prod_{w \in W} \mathrm{Part}'(S_w))$ obtained by removing the least element. Then the restriction maps The restriction maps $\{r_{S_w} : \mathrm{Part}'(S) \to \mathrm{Part}'(S_w)\}$ induce a right cofinal functor

$$\mathrm{N}(\mathrm{Part}'^0(S)) \to \mathrm{N}(\prod_{w \in W} \mathrm{Part}'(S_w))^0.$$

To prove (*viii*), let us fix an element $\{\vec{E}'_w\}_{w \in W}$ of $\prod_{w \in W} \mathrm{Part}'(S_w)$ which is not the least element. Using the criterion of Theorem HTT.4.1.3.1 , we are reduced to proving that the partially ordered set $Z = \{\vec{E}' \in \mathrm{Part}'^0(S) : (\forall w \in W)[r_{S_w}(\vec{E}') \subseteq \vec{E}_w]\}$ has weakly contractible nerve. Let $Z'' \subseteq \mathrm{Part}(S)$ be the subset consisting of those nonempty chains $\vec{E}' = (E'_0 \subseteq \ldots \subseteq E'_{k'}) \in \mathrm{Part}(S)$ such that $E'_{k'} \subseteq E$ and $r_{S_w}(\vec{E}') \subseteq \vec{E}'_w$ for each $w \in W$, and let $Z' \subseteq Z''$ be the subset obtained by removing the one-element chain $\{E\}$. The inclusion $Z \hookrightarrow Z'$ has a left adjoint (given by the construction $\vec{E}' \mapsto \vec{E}' \cup \{E\}$) and therefore induces a weak homotopy equivalence $\mathrm{N}(Z) \to \mathrm{N}(Z')$. We are therefore reduced to proving that $\mathrm{N}(Z')$ is weakly contractible. Note that each

小红书 小红书号:3189205503 qq

$\vec{E}'_w$ determines an embedding $\Delta^{a_w} \hookrightarrow \mathrm{Equiv}(S_w)$. Since $\{\vec{E}'_w\}_{w \in W}$ is not the least element of $\prod_{w \in W} \mathrm{Part}'(S_w)$, at least one of the integers a_w is nonzero. Unwinding the definitions, we can identify $\mathrm{N}(Z'')$ with the barycentric subdivision of the product $\prod_{w \in W} \Delta^{a_w}$. The weak contractibility of $\mathrm{N}(Z')$ now follows from Lemma 6.3.6.1.

For every subset $S' \subseteq S_w$, we let $r^w_{S'} : \mathrm{Part}'(S_w) \to \mathrm{Part}'(S')$ denote the evident restriction map. Define functors $F_w, F'_w : \mathrm{N}(\mathrm{Part}'(S_w)) \to \mathrm{Fun}(\mathrm{Sp}(\mathcal{C})^n_0, \mathrm{Sp}(\mathcal{C})_1)$ by the formulae

$$F_w(\vec{E}'_w) = \vec{\partial}(G_w \circ \prod_{S' \in S_w/E_w} (\psi_{S'} \circ r^w_{S'})(\vec{E}'_w)) \qquad F'_w(\{\vec{E}'_w\}) = \vec{\partial}(G_w) \circ \prod_{S' \in S_w/E_w} \vec{\partial}(\psi_{S'} \circ r^w_{S'})(\vec{E}'_w).$$

Let

$$F_0 : \prod_{w \in W} \mathrm{N}(\mathrm{Part}'(S_w)) \to \mathrm{Fun}(\mathrm{Sp}(\mathcal{C})^n_0, \mathrm{Sp}(\mathcal{C})_2)$$

be given by the formula $F_0(\{\vec{E}_w\}) = H \circ \prod_{w \in W} F_w(\vec{E}_w)$, and define F'_0 similarly. Then we can recover F and F' as the composite functors

$$\mathrm{Part}'(S) \to \prod_{w \in W} \mathrm{Part}'(S_w) \xrightarrow{F_0} \mathrm{Fun}(\mathrm{Sp}(\mathcal{C})^n_0, \mathrm{Sp}(\mathcal{C})_2)$$

$$\mathrm{Part}'(S) \to \prod_{w \in W} \mathrm{Part}'(S_w) \xrightarrow{F'_0} \mathrm{Fun}(\mathrm{Sp}(\mathcal{C})^n_0, \mathrm{Sp}(\mathcal{C})_2).$$

We have an evident commutative diagram

$$\begin{array}{ccc} \mathrm{tfib}\, F_0 & \longrightarrow & \mathrm{tfib}\, F'_0 \\ \downarrow & & \downarrow \\ \mathrm{tfib}\, F & \longrightarrow & \mathrm{tfib}\, F', \end{array}$$

and assertion $(viii)$ guarantees that the vertical maps are equivalences. We are therefore reduced to proving that the map $\rho : \mathrm{tfib}\, F_0 \to \mathrm{tfib}\, F'_0$ is an equivalence. Since the functor H is exact in each variable, we can identify ρ with the canonical map $H \circ \prod_{w \in W} \{\mathrm{tfib}\, F_w\}_{w \in W} \to H \circ \prod_{w \in W} \{\mathrm{tfib}\, F'_w\}_{w \in W}$. It will therefore suffice to show that for each $w \in W$, the map $\mathrm{tfib}\, F_w \to \mathrm{tfib}\, F'_w$ is an equivalence. Equivalently, we wish to show that the diagram

$$\begin{array}{ccc} \vec{\partial}(G \circ \prod_{S' \in S_w/E_w} (\psi_{S'} \circ r^w_{S'})(\{E_w\})) & \longrightarrow & \varprojlim_{\vec{E}'_w \in \mathrm{Part}'^0(S_w)} \vec{\partial}(G \circ \prod_{S' \in S_w/E_w} (\psi_{S'} \circ r^w_E)(\vec{E}'_w)) \\ \downarrow & & \downarrow \\ \vec{\partial}(G) \circ \prod_{S' \in S_w/E_w} \vec{\partial}((\psi_{S'} \circ r^w_{S'})(\{E_w\})) & \longrightarrow & \varprojlim_{\vec{E}'_w \in \mathrm{Part}'^0(S_w)} \vec{\partial}(G) \circ \prod_{S' \in S_w/E_w} \vec{\partial}(\psi_{S'} \circ r^w_{S'})(\vec{E}'_w) \end{array}$$

is a pullback square in $\mathrm{Fun}(\mathrm{Sp}(\mathcal{C})^n_0, \mathrm{Sp}(\mathcal{C})_1)$. The proof now proceeds exactly as in the case $k = 0$ (with some minor changes in notation). $\square$

Chapter 7

Algebra in the Stable Homotopy Category

Let Sp denote the ∞-category of spectra. In §4.8.2, we saw that Sp admits a symmetric monoidal structure (the *smash product* symmetric monoidal structure) which is characterized up to equivalence by the requirement that the sphere spectrum $S \in \mathrm{Sp}$ is the unit object and the tensor product functor $\otimes : \mathrm{Sp} \times \mathrm{Sp} \to \mathrm{Sp}$ preserves colimits separately in each variable. This operation can be regarded as a homotopy theoretic analogue of the usual tensor product of abelian groups. In this chapter, we will undertake a systematic study of commutative and noncommutative algebra in the ∞-category Sp.

We begin in §7.1 by introducing the notion of an $\mathbb{E}_k$*-ring*, for $0 \leq k \leq \infty$. To guide the reader's intuition, we offer the following table of analogies:

Ordinary Algebra	∞-Categorical Algebra
Set	Space
Abelian group	Spectrum
Tensor product of abelian groups	Smash product of spectra
Associative Ring	$\mathbb{E}_1$-Ring
Commutative Ring	$\mathbb{E}_\infty$-Ring

Our goal in §7.2 is to show that these analogies are fairly robust, in the sense that many of the basic tools used in commutative and noncommutative algebra can be generalized to the setting of structured ring spectra.

小红书
小红书号:3189205503 qq

The remainder of this chapter is devoted to studying the deformation theory of $\mathbb{E}_k$-rings. In §7.3, we will introduce a general formalism describing the *relative cotangent complex* $L_{B/A}$ of a morphism $\phi : A \to B$ in a presentable ∞-category $\mathcal{C}$. When $\mathcal{C}$ is the ∞-category of $\mathbb{E}_\infty$-rings, then we can identify $L_{B/A}$ with an object of the ∞-category $\mathrm{Mod}_B(\mathrm{Sp})$ of *B-module spectra*. In §7.4, we will see that many questions about a map $\phi : A \to B$ of $\mathbb{E}_\infty$-rings can be reduced to questions about $L_{B/A}$: that is, to problems in *stable* homotopy theory. In §7.5, we will apply this technology to obtain a classification of étalemorphisms between structured ring spectra.

Warning 7.0.0.1. Let R be an associative ring, and let M and N be right and left modules over R, respectively. Then we can regard R as a discrete $\mathbb{E}_1$-algebra in the ∞-category of spectra, and M and N as discrete module spectra over R. Consequently, we can compute the tensor product $M \otimes_R N$ either in the ∞-category of spectra or in the ordinary category of abelian groups. Unless otherwise specified, the notation $M \otimes_R N$ will indicate the relative tensor product in the ∞-category of spectra. We will denote the ordinary algebraic tensor product by $\mathrm{Tor}_0^R(M, N)$. These are generally different from one another: for example, the spectrum $M \otimes_R N$ need not be discrete. In fact, in §7.2 we will see that there are canonical isomorphisms $\pi_i(M \otimes_R N) \simeq \mathrm{Tor}_i^R(M, N)$ (Corollary 7.2.1.22). In particular, the algebraic tensor product $\mathrm{Tor}_0^R(M, N)$ can be realized as the 0th homotopy group of the spectrum $M \otimes_R N$.

In cases where the groups $\mathrm{Tor}_i^R(M, N)$ vanish for $i > 0$ (for example, if either M or N is a projective module over R), we will generally not distinguish in notation between $M \otimes_R N$ and $\mathrm{Tor}_0^R(M, N)$.

Remark 7.0.0.2. The theory of structured ring spectra plays an important role in modern stable homotopy theory. There is a vast literature on the subject, which we will not attempt to review here. We refer the readers to [51] for a foundational approach using the language of model categories, rather than the language of ∞-categories which we employ in this book.

7.1 Structured Ring Spectra

In this section, we introduce homotopy-theoretic analogues of some elementary notions from commutative and noncommutative algebra. Our starting point is the following:

Definition 7.1.0.1. Let $0 \leq k \leq \infty$, and let Sp denote the ∞-category of spectra (which we regard as endowed with the smash product monoidal structure of §4.8.2). Let $\mathbb{E}_k^\otimes$ denote the ∞-operad of little k-cubes (Definition 5.1.0.2). An *$\mathbb{E}_k$-ring* is an $\mathbb{E}_k$-algebra object of Sp. We let $\mathrm{Alg}^{(k)}$ denote the ∞-category $\mathrm{Alg}_{\mathbb{E}_k}(\mathrm{Sp})$ of $\mathbb{E}_k$-rings.

In the special case $k = \infty$, we will agree that $\mathbb{E}_k^\otimes$ denotes the commutative ∞-operad $\mathrm{Comm}^\otimes = \mathrm{N}(\mathcal{F}\mathrm{in}_*)$ (see Corollary 5.1.1.5) and we let CAlg denote the ∞-category $\mathrm{CAlg}(\mathrm{Sp}) = \mathrm{Alg}_{\mathbb{E}_\infty}(\mathrm{Sp})$ of $\mathbb{E}_\infty$-rings.

小红书
小红书号:3189205503 qq

Remark 7.1.0.2. The terminology of Definition 7.1.0.1 is somewhat nonstandard. What we call $\mathbb{E}_k$-rings are often called *$\mathbb{E}_k$-ring spectra*. In the special case $k = \infty$, the term *commutative ring spectrum* is sometimes used, though some authors reserve this term for commutative algebra objects in the homotopy category hSp (that is, spectra which are equipped with a multiplication which is commutative and associative up to homotopy, rather than up to coherent homotopy). In the special case $k = 1$, many authors refer to $\mathbb{E}_1$-rings as *associative ring spectra* or *A_∞-ring spectra*.

Remark 7.1.0.3. Let R be an $\mathbb{E}_k$-ring for $0 \leq k \leq \infty$. We will say that R is *discrete* if its underlying spectrum is discrete: that is, if $\pi_i R \simeq 0$ for $i \neq 0$. The ∞-category of discrete $\mathbb{E}_k$-rings can be identified with the ∞-category of $\mathbb{E}_k$-algebra objects of $\mathrm{Sp}^\heartsuit$, which is equivalent to the nerve of the ordinary category of abelian groups. It follows that when $k = 1$, the ∞-category of discrete $\mathbb{E}_1$-rings is equivalent to the nerve of the category of associative rings. Using Corollary 5.1.1.7, we see that the ∞-category of discrete $\mathbb{E}_k$-rings is equivalent to the nerve of the category of commutative rings whenever $k \geq 2$.

Remark 7.1.0.4. If R is an $\mathbb{E}_k$-ring, then we can view R as an $\mathbb{E}_{k'}$-ring for any $k' \leq k$. More precisely, the sequence of maps

$$\mathbb{E}_0^\otimes \hookrightarrow \mathbb{E}_1^\otimes \to \cdots \to \mathbb{E}_\infty^\otimes = \mathrm{Comm}^\otimes$$

induces forgetful functors

$$\mathrm{CAlg} \to \cdots \to \mathrm{Alg}^{(2)} \to \mathrm{Alg}^{(1)} \to \mathrm{Alg}^{(0)}\,.$$

If $R \in \mathrm{Alg}^{(k)}$, we will generally abuse notation by identifying R with its image in $\mathrm{Alg}^{(k')}$ for $k' \leq k$.

Remark 7.1.0.5. Using Remark 4.8.2.22, we can identify the ∞-category $\mathrm{Alg}^{(1)}$ of $\mathbb{E}_1$-rings with the full subcategory of $\mathrm{Alg}(\mathrm{Fun}(\mathrm{Sp}, \mathrm{Sp}))$ spanned by those monads T on Sp which preserve small colimits.

We will begin our study of $\mathbb{E}_k$-rings by considering the case $k = 1$. According to Example 5.1.0.7, we can identify the ∞-category $\mathrm{Alg}^{(1)}$ of $\mathbb{E}_1$-rings with the ∞-category $\mathrm{Alg} = \mathrm{Alg}(\mathrm{Sp})$. In other words, we can think of an $\mathbb{E}_1$-ring as a spectrum A equipped with a multiplication $A \otimes A \to A$, which is associative up to coherent homotopy. The technology of Chapter 4 provides us with a robust theory of (left and right) modules over $\mathbb{E}_1$-rings, which we study in §7.1.1.

For any $\mathbb{E}_1$-ring A, the ∞-category $\mathrm{LMod}_A = \mathrm{LMod}_A(\mathrm{Sp})$ is stable and compactly generated. In §7.1.2 we will prove a converse to this statement (due to Schwede and Shipley): if $\mathcal{C}$ is a presentable stable ∞-category which is generated by a single compact object $\mathbf{1} \in \mathcal{C}$, then we can describe $\mathcal{C}$ as the ∞-category of left modules over the endomorphism object $R = \mathrm{End}_{\mathcal{C}}(\mathbf{1})$ (see Theorem 7.1.2.1). Moreover, we show that promoting R to an $\mathbb{E}_{k+1}$-ring is equivalent to promoting $\mathcal{C}$ to an $\mathbb{E}_k$-monoidal ∞-category (having $\mathbf{1}$ as unit object). In this case, it makes sense to consider $\mathbb{E}_k$-algebra objects of $\mathcal{C}$, which we refer to as *$\mathbb{E}_k$-algebras over R*. In §7.1.3, we will study the theory

小红书
小红书号:3189205503 qq

of $\mathbb{E}_k$-algebras over an $\mathbb{E}_{k+1}$-ring R, and prove a technical result (Theorem 7.1.3.1) which implies that many natural constructions are compatible with change of R.

Using Theorem 4.1.8.4, we conclude that $\mathrm{Alg}^{(1)}$ is equivalent to the underlying ∞-category of strictly associative monoids in any sufficiently nice monoidal model category of spectra (see Example 4.1.8.6). If we are interested in studying algebras over a *discrete* $\mathbb{E}_\infty$-ring R, then much more concrete models are available. In §7.1.4, we will show that the theory of $\mathbb{E}_1$-algebras over R is equivalent to the theory of differential graded algebras (Proposition 7.1.4.6). When R contains the field $\mathbf{Q}$ of rational numbers, there is a similar description of the ∞-category of $\mathbb{E}_\infty$-algebras over R (Proposition 7.1.4.11).

7.1.1 $\mathbb{E}_1$-Rings and Their Modules

Let $R \in \mathrm{Alg}^{(1)}$ be an $\mathbb{E}_1$-ring. In this section, we will introduce the theory of *R-module spectra*. This can be regarded as a generalization of homological algebra: if R is an ordinary ring (regarded as a discrete $\mathbb{E}_1$-ring via Proposition 7.1.3.18), then the homotopy category of R-module spectra coincides with the classical *derived category* of R (Proposition 7.1.1.15); in particular, the theory of R-module spectra is a generalization of the usual theory of R-modules.

Notation 7.1.1.1. According to Example 5.1.0.7, there is a trivial Kan fibration of ∞-operads $q : \mathbb{E}_1^{\otimes} \to \mathrm{Assoc}^{\otimes}$. We will fix a section of q. For any symmetric monoidal ∞-category $\mathcal{C}$, composition with this section induces an equivalence of ∞-categories $\theta : \mathrm{Alg}_{\mathbb{E}_1}(\mathcal{C}) \to \mathrm{Alg}(\mathcal{C})$. We will generally abuse notation by identifying an $\mathbb{E}_1$-algebra object $A \in \mathrm{Alg}_{\mathbb{E}_1}(\mathcal{C})$ with its image in $\mathrm{Alg}(\mathcal{C})$. In particular, we will denote the ∞-categories $\mathrm{LMod}_{\theta(A)}(\mathcal{C})$ and $\mathrm{RMod}_{\theta(A)}(\mathcal{C})$ defined in §4.2.1 by $\mathrm{LMod}_A(\mathcal{C})$ and $\mathrm{RMod}_A(\mathcal{C})$, respectively.

If A is an $\mathbb{E}_\infty$-ring, then we let Mod_A denote the ∞-category $\mathrm{Mod}_A^{\mathbb{E}_\infty}(\mathrm{Sp})$, so that we have canonical equivalences

$$\mathrm{LMod}_A \leftarrow \mathrm{Mod}_A \to \mathrm{RMod}_A$$

(see Proposition 4.5.1.4).

Definition 7.1.1.2. Let R be an $\mathbb{E}_1$-ring. We let LMod_R denote the ∞-category $\mathrm{LMod}_R(\mathrm{Sp})$. We will refer to LMod_R as the *∞-category of left R-module spectra*. Similarly, we let RMod_R denote the ∞-category $\mathrm{RMod}_R(\mathrm{Sp})$ of *right R-module spectra*.

Remark 7.1.1.3. If R is an $\mathbb{E}_1$-ring, we will often refer to (left or right) R-module spectra simply as (left or right) *R-modules*.

For the sake of definiteness, we will confine our attention to the study of left module spectra throughout this section; the theory of right module spectra can be treated in an entirely parallel way.

Our first goal is to prove that the ∞-category of modules over an $\mathbb{E}_1$-ring is stable. This is a consequence of the following more general assertion:

小红书
小红书号:3189205503 qq

Proposition 7.1.1.4. *Let $\mathcal{C}$ be an ∞-category equipped with a monoidal structure and a left action on an ∞-category $\mathcal{M}$. Assume that $\mathcal{M}$ is a stable ∞-category, and let $R \in \mathrm{Alg}(\mathcal{C})$ be such that the functor $M \mapsto R \otimes M$ is exact. Then $\mathrm{LMod}_R(\mathcal{M})$ is a stable ∞-category. Moreover, if $\mathcal{N}$ is an arbitrary stable ∞-category, then a functor $\mathcal{N} \to \mathrm{LMod}_R(\mathcal{M})$ is exact if and only if the composite functor $\mathcal{N} \to \mathrm{LMod}_R(\mathcal{M}) \to \mathcal{M}$ is exact. In particular, the forgetful functor $\mathrm{LMod}_R(\mathcal{M}) \to \mathcal{M}$ is exact.*

Proof. This is a special case of Proposition 4.2.3.4. □

Corollary 7.1.1.5. *Let R be an $\mathbb{E}_1$-ring. Then the ∞-categories LMod_R and RMod_R are stable.*

We next consider connectivity properties of $\mathbb{E}_1$-rings and their modules. Let R be an $\mathbb{E}_1$-ring. We will generally not distinguish notationally between R and its underlying spectrum. In particular, for each $n \in \mathbf{Z}$, we let $\pi_n R$ denote the nth homotopy group of the underlying spectrum. We observe that $\pi_n R$ can be identified with the set $\pi_0 \mathrm{Map}_{\mathrm{Sp}}(S[n], R)$, where S denotes the sphere spectrum. Since S is the identity for the smash product, there is a canonical equivalence $S \otimes S \simeq S$; using the fact that $\otimes$ is exact in each variable, we deduce the existence of equivalences $S[n] \otimes S[m] \simeq S[n+m]$ for all $n, m \in \mathbf{Z}$. The multiplication map

$$\mathrm{Map}_{\mathrm{Sp}}(S[n], R) \times \mathrm{Map}_{\mathrm{Sp}}(S[m], R) \to \mathrm{Map}_{\mathrm{Sp}}(S[n] \otimes S[m], R \otimes R) \to \mathrm{Map}_{\mathrm{Sp}}(S[n+m], R)$$

determines a bilinear map $\pi_n R \times \pi_m R \to \pi_{n+m} R$. It is not difficult to see that these maps endow $\pi_* R = \bigoplus_n \pi_n R$ with the structure of a graded associative ring, which depends functorially on R. In particular, $\pi_0 R$ is an ordinary associative ring, and each $\pi_n R$ has the structure of a $\pi_0 R$-bimodule.

Remark 7.1.1.6. If R admits the structure of an $\mathbb{E}_k$-ring for $k \geq 2$, we can say a bit more. In this case, the multiplication on R is commutative (up to homotopy). It follows that the multiplication on $\pi_* R$ is *graded commutative*. That is, for $x \in \pi_n R$ and $y \in \pi_m R$, we have $xy = (-1)^{nm} yx$. Here the sign results from the fact that the composition

$$S[n+m] \simeq S[n] \otimes S[m] \overset{\sigma}{\simeq} S[m] \otimes S[n] \simeq S[n+m]$$

is given by the sign $(-1)^{nm}$. In particular, the homotopy group $\pi_0 R$ is equipped with the structure of a commutative ring, and every other homotopy group $\pi_n R$ has the structure of a module over $\pi_0 R$.

We will need the following basic result:

Lemma 7.1.1.7. *The t-structure on the ∞-category Sp determined by the class of connective objects is compatible with the smash product symmetric monoidal structure (in the sense of Example 2.2.1.3). In other words, the full subcategory $\mathrm{Sp}^{\mathrm{cn}} \subseteq \mathrm{Sp}$ spanned by the connective objects is closed under smash products and contains the unit object. Consequently, the monoidal structure on Sp determines a monoidal structure on $\mathrm{Sp}^{\mathrm{cn}}$.*

小红书
小红书号:3189205503 qq

Proof. The ∞-category $\mathrm{Sp}^{\mathrm{cn}}$ is the smallest full subcategory of Sp which contains the sphere spectrum $S \in \mathrm{Sp}$ and is stable under colimits and extensions. Let $\mathcal{C}$ be the full subcategory of Sp spanned by those spectra X such that, for all $Y \in \mathrm{Sp}^{\mathrm{cn}}$, $X \otimes Y$ is connective. We wish to prove that $\mathrm{Sp}^{\mathrm{cn}} \subseteq \mathcal{C}$. Since the smash product preserves colimits separately in each variable, we conclude that $\mathcal{C}$ is closed under colimits and extensions in Sp. It will therefore suffice to prove that $S \in \mathcal{C}$. This is clear, since S is the unit object of Sp. $\square$

Recall that a spectrum X is said to be *connective* if $\pi_n X \simeq 0$ for $n < 0$. We will say that an $\mathbb{E}_k$-ring R is *connective* if its underlying spectrum is connective. We let $\mathrm{Alg}^{(k),\mathrm{cn}}$ denote the full subcategory of $\mathrm{Alg}^{(k)}$ spanned by the connective $\mathbb{E}_k$-rings. We can equivalently define $\mathrm{Alg}^{(k),\mathrm{cn}}$ to be the ∞-category $\mathrm{Alg}_{\mathbb{E}_k}(\mathrm{Sp}^{\mathrm{cn}})$, where $\mathrm{Sp}^{\mathrm{cn}}$ denotes the full subcategory of Sp spanned by the connective spectra (the full subcategory $\mathrm{Sp}^{\mathrm{cn}} \subset \mathrm{Sp}$ inherits a symmetric monoidal structure in view of Proposition 2.2.1.1 and Lemma 7.1.1.7). In the special case $k = \infty$, we will denote this ∞-category $\mathrm{CAlg}_{\mathbb{E}_k}(\mathrm{Sp}^{\mathrm{cn}})$ by $\mathrm{CAlg}^{\mathrm{cn}}$.

Let M be a left R-module spectrum for some $\mathbb{E}_1$-ring R. We will generally abuse notation by identifying M with its image in Sp. In particular, we define the homotopy groups $\{\pi_n M\}_{n \in \mathbf{Z}}$ of M to be the homotopy groups of the underlying spectrum. The action map $R \otimes M \to M$ induces bilinear maps $\pi_n R \times \pi_m M \to \pi_{n+m} M$, which endow the sum $\pi_* M = \bigoplus_{n \in \mathbf{Z}} \pi_n M$ with the structure of a graded left module over $\pi_* R$. We will say that M is *connective* if its underlying spectrum is connective; that is, if $\pi_n M \simeq 0$ for $n < 0$.

Remark 7.1.1.8. When restricted to connective $\mathbb{E}_k$-rings, the functor Ω^∞ detects equivalences: if $f : A \to B$ is a morphism in $\mathrm{Alg}^{(k),\mathrm{cn}}$ such that $\Omega^\infty(f)$ is an equivalence, then f is an equivalence. We observe that the functor $\Omega^\infty : \mathrm{Alg}^{(k),\mathrm{cn}} \to \mathcal{S}$ is a composition of a pair of functors $\mathrm{Alg}_{\mathbb{E}_k}(\mathrm{Sp}^{\mathrm{cn}}) \to \mathrm{Sp}^{\mathrm{cn}} \to \mathcal{S}$, both of which preserve sifted colimits (Corollaries 3.2.3.2 and 1.4.3.9) and admit left adjoints. It follows from Theorem 4.7.3.5 that $\mathrm{Alg}^{(k),\mathrm{cn}}$ can be identified with the ∞-category of modules over a suitable monad on $\mathcal{S}$. In other words, we can view connective $\mathbb{E}_k$-rings as spaces equipped with some additional structures. Roughly speaking, these additional structures consist of an addition and multiplication which satisfy the axioms for a ring (commutative if $k \geq 2$), up to coherent homotopy.

The functor $\Omega^\infty : \mathrm{Alg}^{(k)} \to \mathcal{S}$ is not conservative: a map of $\mathbb{E}_k$-rings $f : A \to B$ which induces a homotopy equivalence of underlying spaces need not be an equivalence in $\mathrm{Alg}^{(k)}$. We observe that f is an equivalence of $\mathbb{E}_k$-rings if and only if it is an equivalence of spectra; that is, if and only if $\pi_n(f) : \pi_n A \to \pi_n B$ is an isomorphism of abelian groups for all $n \in \mathbf{Z}$. However, $\Omega^\infty(f)$ is a homotopy equivalence of spaces provided only that $\pi_n(f)$ is an isomorphism for $n \geq 0$; this is generally a weaker condition.

Remark 7.1.1.9. Roughly speaking, if we think of an $\mathbb{E}_1$-ring R as a space equipped with the structure of an associative ring up to coherent homotopy, then a left R-module can be thought of as another space which has an addition and a left action of R, up to coherent homotopy in the

小红书
小红书号:3189205503 qq

same sense. This intuition is really only appropriate in the case where R and M are connective, since the homotopy groups in negative degree have no simple interpretation in terms of underlying spaces.

If R is a connective $\mathbb{E}_1$-ring, the formation of homotopy groups of a left R-module M can be interpreted in terms of an appropriate t-structure on LMod_R.

Notation 7.1.1.10. If R is an $\mathbb{E}_1$-ring, we let $\mathrm{LMod}_R^{\geq 0}$ be the full subcategory of LMod_R spanned by those left R-modules M for which $\pi_n M \simeq 0$ for $n < 0$, and $\mathrm{LMod}_R^{\leq 0}$ the full subcategory of LMod_R spanned by those R-modules M for which $\pi_n M \simeq 0$ for $n > 0$.

Notation 7.1.1.11. Let R be an $\mathbb{E}_1$-ring, and let M and N be left R-modules. We let $\mathrm{Ext}_R^i(M, N)$ denote the abelian group $\pi_0 \mathrm{Map}_{\mathrm{LMod}_R}(M, N[i])$.

Remark 7.1.1.12. Suppose that R is an associative ring, regarded as a discrete $\mathbb{E}_1$-ring, and let M and N be discrete left R-modules. Then the abelian groups $\mathrm{Ext}_R^i(M, N)$ of Notation 7.1.1.11 can be identified with the usual Yoneda Ext-groups, computed in the abelian category of (discrete) left R-modules. This is a consequence of Proposition 7.1.1.15, proven below.

Proposition 7.1.1.13. *Let R be a connective $\mathbb{E}_1$-ring. Then:*

(1) *The full subcategory $\mathrm{LMod}_R^{\geq 0} \subseteq \mathrm{LMod}_R$ is the smallest full subcategory which contains R (regarded as an R-module in the natural way; see Example 4.2.1.17) and is stable under small colimits.*

(2) *The subcategories $\mathrm{LMod}_R^{\geq 0}, \mathrm{LMod}_R^{\leq 0}$ determine an accessible t-structure on LMod_R (see §1.2.1).*

(3) *The t-structure described in (2) is both left and right complete, and the functor π_0 determines an equivalence of the heart $\mathrm{LMod}_R^{\heartsuit}$ with the (nerve of the) ordinary category of (discrete) $\pi_0 R$-modules.*

(4) *The subcategories $\mathrm{LMod}_R^{\geq 0}, \mathrm{LMod}_R^{\leq 0} \subseteq \mathrm{LMod}_R$ are stable under small products and small filtered colimits.*

Proof. According to Proposition 1.4.4.11, there exists an accessible t-structure $(\mathrm{LMod}_R', \mathrm{LMod}_R'')$ with the following properties:

(a) An object $M \in \mathrm{LMod}_R$ belongs to LMod_R'' if and only if $\mathrm{Ext}_R^i(R, M) \simeq 0$ for $i < 0$.

(b) The ∞-category LMod_R' is the smallest full subcategory of LMod_R which contains the object R and is stable under extensions and small colimits.

小红书
小红书号:3189205503 qq

Corollary 4.2.4.8 implies that R (regarded as an object of LMod_R) corepresents the composition $\mathrm{LMod}_R \to \mathrm{Sp} \xrightarrow{\Omega^\infty} \mathcal{S}$. It follows that $\mathrm{LMod}_R'' = \mathrm{LMod}_R^{\leq 0}$. Because the forgetful functor $\mathrm{LMod}_R \to \mathrm{Sp}$ preserves small colimits (Corollary 4.2.3.5), we conclude that $\mathrm{LMod}_R^{\geq 0}$ is stable under extensions and small colimits. Since R is connective, $R \in \mathrm{LMod}_R^{\geq 0}$, so that $\mathrm{LMod}_R' \subseteq \mathrm{LMod}_R^{\geq 0}$. Let $\mathcal{C}$ be the smallest full subcategory of LMod_R which contains R and is stable under small colimits, so that $\mathcal{C} \subseteq \mathrm{LMod}_R'$. We will complete the proof of (1) and (2) by showing that $\mathcal{C} = \mathrm{LMod}_R^{\geq 0}$.

Let $M \in \mathrm{LMod}_R^{\geq 0}$. We will construct a diagram

$$M(0) \to M(1) \to M(2) \to \ldots$$

in $(\mathrm{LMod}_R)_{/M}$ with the following properties:

(*i*) Let $i \geq 0$, and let $K(i)$ be a fiber of the map $M(i) \to M$. Then $\pi_j K(i) \simeq 0$ for $j < i$.

(*ii*) The R-module $M(0)$ is a coproduct of copies of R.

(*iii*) For $i \geq 0$, there is a pushout diagram

$$\begin{array}{ccc} F[i] & \longrightarrow & 0 \\ \downarrow & & \downarrow \\ M(i) & \longrightarrow & M(i+1), \end{array}$$

where F is a coproduct of copies of R.

We begin by choosing $M(0)$ to be any coproduct of copies of R equipped with a map $M(0) \to M$ which induces a surjection $\pi_0 M(0) \to \pi_0 M$; for example, we can take $M(0)$ to be a coproduct of copies of R indexed by $\pi_0 M$. Let us now suppose that the map $f : M(i) \to M$ has been constructed, with $K(i) = \mathrm{fib}(f)$ such that $\pi_j K(i) \simeq 0$ for $j < i$. We now choose F to be a coproduct of copies of R and a map $g : F[i] \to K(i)$ which induces a surjection $\pi_0 F \to \pi_i K(i)$. Let h denote the composite map $F[i] \to K(i) \to M(i)$, and let $M(i+1) = \mathrm{cofib}(h)$. The canonical nullhomotopy of $K(i) \to M(i) \to M$ induces a factorization

$$M(i) \to M(i+1) \xrightarrow{f'} M$$

of f. We observe that there is a canonical equivalence $\mathrm{fib}(f') \simeq \mathrm{cofib}(g)$, so that $\pi_j \mathrm{fib}(f') \simeq 0$ for $j \leq i$.

Let $M(\infty)$ be the colimit of the sequence $\{M(i)\}$, and let K be the fiber of the canonical map $M(\infty) \to M$. Then K can be identified with a colimit of the sequence $\{K(i)\}_{i \geq 0}$. Since the formation of homotopy groups is preserves filtered colimits, we conclude that $\pi_j K \simeq \mathrm{colim}\, \pi_j K(i) \simeq 0$. Thus $M(\infty) \simeq M$, so that $M \in \mathcal{C}$ as desired.

Assertion (4) follows from the corresponding result for Sp, since the forgetful functor $\mathrm{LMod}_R \to \mathrm{Sp}$ preserves all limits and colimits (Corollaries 4.2.3.3 and 4.2.3.5). Since $\mathrm{LMod}_R \to \mathrm{Sp}$ is a

小红书
小红书号:3189205503 qq

conservative functor, an R-module M is zero if and only if $\pi_n M$ is zero for all $n \in \mathbf{Z}$. It follows from Proposition 1.2.1.19 that LMod_R is both right and left complete.

Let F be the functor from $\mathrm{LMod}_R^{\geq 0}$ to the (nerve of the) ordinary category of left $\pi_0 R$-modules, given by $M \mapsto \pi_0 M$. It is easy to see that F preserves colimits, and that the restriction of F to $\mathrm{LMod}_R^{\heartsuit}$ is an exact functor. We wish to prove that $F_0 = F | \mathrm{LMod}_R^{\heartsuit}$ is an equivalence. We first show that the restriction of F_0 is fully faithful. Fix $N \in \mathrm{LMod}_R^{\heartsuit}$, and let $\mathcal{D}$ be the full subcategory of $\mathrm{LMod}_R^{\geq 0}$ spanned by those objects M for which the map $\pi_0 \mathrm{Map}_{\mathrm{LMod}_R}(M, N) \to \mathrm{Hom}(F(\tau_{\leq 0} M), F(N))$ is bijective, where the right hand side indicates the group of $\pi_0 R$-module homomorphims. It is easy to see that $\mathcal{D}$ is stable under colimits and contains R. The first part of the proof shows that $\mathcal{D} = \mathrm{LMod}_R^{\geq 0}$. In particular, F_0 is fully faithful.

It remains to show that F_0 is essentially surjective. Since F_0 is fully faithful and exact, the essential image of F_0 is closed under the formation of cofibers. It will therefore suffice to show that every free left $\pi_0 R$-module belongs to the essential image of F_0. Since F_0 preserves coproducts, it will suffice to show that $\pi_0 R$ itself belongs to the essential image of F_0. We now conclude by observing that $F_0(\tau_{\leq 0} R) \simeq \pi_0 R$. □

Warning 7.1.1.14. Let R be an associative ring, which we can identify with a discrete $\mathbb{E}_1$-ring (Proposition 7.1.3.18). The theory of R-module spectra (Definition 7.1.1.2) does *not* agree with the usual theory of R-modules. Instead, Proposition 7.1.1.13 allows us to identify the usual category of R-modules with the ∞-category of *discrete* R-module spectra.

Let R be a connective $\mathbb{E}_1$-ring, let $\mathcal{A}$ be the abelian category of left modules over the (ordinary) ring $\pi_0 R$. Then $\mathcal{A}$ has enough projective objects, so we can consider the derived ∞-category $\mathcal{D}^-(\mathcal{A})$ described in §1.3.2. Part (3) of Proposition 7.1.1.13 determines an equivalence $\mathrm{N}(\mathcal{A}) \simeq \mathrm{LMod}_R^{\heartsuit}$. Using Proposition 1.3.3.12, we deduce the existence of an (essentially unique) right t-exact functor $\theta : \mathcal{D}^-(\mathcal{A}) \to \mathrm{LMod}_R$.

Proposition 7.1.1.15. *Let R be a connective $\mathbb{E}_1$-ring, and let $\theta : \mathcal{D}^-(\mathcal{A}) \to \mathrm{LMod}_R$ be the functor constructed above. The following conditions are equivalent:*

(1) *The $\mathbb{E}_1$-ring R is discrete. That is, $\pi_i R \simeq 0$ for $i > 0$.*

(2) *The functor θ is fully faithful, and induces an equivalence of $\mathcal{D}^-(\mathcal{A})$ with the ∞-category of right bounded objects of LMod_R.*

Proof. Let $P \in \mathcal{A}$ be the projective object corresponding to the free left $\pi_0 R$-module on one generator. Then, for $M \in \mathcal{D}^-(\mathcal{A})$, we have a canonical isomorphism $\mathrm{Ext}^0_{\mathcal{D}^-(\mathcal{A})}(P, M) \simeq \pi_0 M$. If (2) is satisfied, then we deduce the existence of a canonical isomorphisms

$$\mathrm{Ext}^0_R(\theta(P), M) \simeq \pi_0 M \simeq \mathrm{Ext}^0_R(R, M)$$

for $M \in \mathrm{LMod}_R^{\geq 0}$. Thus $\theta(P)$ and R are isomorphic in the homotopy category hLMod_R. Since $\theta(P)$ is discrete, we conclude that R is discrete, which proves (1).

小红书
小红书号:3189205503 qq

For the converse, let us suppose that R is discrete. Let us regard (the nerve of) $\mathcal{A}$ as a full subcategory of both $\mathcal{D}^-(\mathcal{A})$ and LMod_R. For $M, N \in \mathcal{A}$, let $\mathrm{Ext}^i_{\mathcal{A}}(M,N)$ denote the abelian group $\pi_0 \mathrm{Map}_{\mathcal{D}^-(\mathcal{A})}(M, N[i])$ (in other words, $\mathrm{Ext}^i_{\mathcal{A}}(M,N)$ is the classical Yoneda Ext-group computed in the abelian category $\mathcal{A}$). We claim that the canonical map $\mathrm{Ext}^i_{\mathcal{A}}(M,N) \to \mathrm{Ext}^i_R(M,N)$ is an isomorphism. For $i < 0$, both sides vanish. The proof in general goes by induction on i, the case $i = 0$ being trivial. For $i > 0$, we choose an exact sequence

$$0 \to K \to P \to M \to 0$$

in $\mathcal{A}$, where P is a free $\pi_0 R$-module. We have a commutative diagram of abelian groups with exact rows

$$\begin{array}{ccccccc} \mathrm{Ext}^{i-1}_{\mathcal{A}}(P,N) & \longrightarrow & \mathrm{Ext}^{i-1}_{\mathcal{A}}(K,N) & \longrightarrow & \mathrm{Ext}^{i}_{\mathcal{A}}(M,N) & \longrightarrow & \mathrm{Ext}^{i}_{\mathcal{A}}(P,N) \\ \downarrow{\scriptstyle \psi_1} & & \downarrow{\scriptstyle \psi_2} & & \downarrow{\scriptstyle \psi_3} & & \downarrow \\ \mathrm{Ext}^{i-1}_{R}(P,N) & \longrightarrow & \mathrm{Ext}^{i-1}_{R}(K,N) & \longrightarrow & \mathrm{Ext}^{i}_{R}(M,N) & \longrightarrow & \mathrm{Ext}^{i}_{R}(P,N). \end{array}$$

We wish to show that ψ_3 is an isomorphism. Since ψ_1 and ψ_2 are bijective by the inductive hypothesis, it will suffice to show that $\mathrm{Ext}^i_{\mathcal{A}}(P,N) \simeq 0 \simeq \mathrm{Ext}^i_R(P,N)$. The first equivalence follows from the fact that P is a projective object of $\mathcal{A}$. For the second, we observe that as an object of LMod_R, P coincides with a coproduct of copies of R (in virtue of assumption (1)). Consequently, $\mathrm{Ext}^i_R(P,N)$ can be identified with a product of copies of $\pi_{-i}N$, which vanishes since $i > 0$ and $N \in \mathrm{LMod}_R^{\geq 0}$.

Now suppose that $M \in \mathcal{A}$, and consider the full subcategory $\mathcal{C} \subseteq \mathcal{D}^-(\mathcal{A})$ spanned by those objects N for which the canonical map $\mathrm{Ext}^i_{\mathcal{D}^-(\mathcal{A})}(M,N) \to \mathrm{Ext}^i_R(\theta(M), \theta(N))$ is an isomorphism for all $i \in \mathbf{Z}$. Applying the five lemma to the relevant long exact sequences, we conclude that $\mathcal{C}$ is stable under extensions in $\mathcal{D}^-(\mathcal{A})$. The above argument shows that $\mathcal{C}$ contains the heart of $\mathcal{D}^-(\mathcal{A})$; it therefore contains the full subcategory $\mathcal{D}^b(\mathcal{A})$ of bounded object of $\mathcal{D}^-(\mathcal{A})$.

Now let $\mathcal{C}' \subseteq \mathcal{D}^-(\mathcal{A})$ spanned by those objects M having the property that for *every* $N \in \mathcal{D}^b(\mathcal{A})$, the canonical map $\mathrm{Ext}^i_{\mathcal{D}^-(\mathcal{A})}(M,N) \to \mathrm{Ext}^i_R(\theta(M), \theta(N))$ is an isomorphism for $i \in \mathbf{Z}$. Repeating the above argument, we conclude that $\mathcal{D}^b(\mathcal{A}) \subseteq \mathcal{C}'$. In particular, the restriction $\theta | \mathcal{D}^b(\mathcal{A})$ is fully faithful.

We claim that the essential image of $\theta | \mathcal{D}^b(\mathcal{A})$ consists of precisely the t-bounded objects of LMod_R. Let $M \in \mathrm{LMod}_R$ be a t-bounded object. We wish to prove that M belongs to the essential image of θ. Without loss of generality, we may suppose that $M \in \mathrm{LMod}_R^{\geq 0}$. Since M is t-bounded, we have also $M \in \mathrm{LMod}_R^{\leq n}$ for some $n \geq 0$. We now work by induction on n. If $n = 0$, then M belongs to the heart of LMod_R and the result is obvious. If $n > 0$, then we have a fiber sequence

$$\tau_{\geq n} M \to M \to \tau_{\leq n-1} M.$$

Since θ is exact and fully faithful, it will suffice to show that $\tau_{\geq n} M[-n]$ and $\tau_{\leq n-1} M$ belong to the essential image of θ, which follows from the inductive hypothesis.

小红书
小红书号:3189205503 qq

The preceding argument shows that θ induces an equivalence $\mathcal{D}^b(\mathcal{A}) \to \mathrm{LMod}_R^b$ between the full subcategories of bounded objects. We now conclude by observing that both $\mathcal{D}^-(\mathcal{A})$ and LMod_R are left complete. □

Remark 7.1.1.16. Let R and $\mathcal{A}$ be as in Proposition 7.1.1.15, and assume that R is discrete. Let $\mathcal{D}(\mathcal{A})$ be the unbounded derived ∞-category of $\mathcal{A}$ (Definition 1.3.5.8), so that Proposition 1.3.5.24 allows us to identify $\mathcal{D}^-(\mathcal{A})$ with the full subcategory of $\mathcal{D}(\mathcal{A})$ spanned by the right bounded objects. Since $\mathcal{D}(\mathcal{A})$ and LMod_R are both right complete (Propositions 1.3.5.21 and 7.1.1.13), the fully faithful embedding $\mathcal{D}(\mathcal{A})^- \to \mathrm{LMod}_R$ induces an equivalence of ∞-categories $\mathcal{D}(\mathcal{A}) \simeq \mathrm{LMod}_R$. In other words, the ∞-category of left R-module spectra can be identified with the derived ∞-category of the abelian category of (discrete) R-modules.

7.1.2 Recognition Principles

Let R be a commutative ring and let $\mathcal{A}$ denote the abelian category of (discrete) R-modules. We will regard R as a discrete E_∞-ring, and let Mod_R denote the ∞-category of R-module spectra as in Notation 7.1.1.1. According to Remark 7.1.1.16, we can identify Mod_R with the derived ∞-category $\mathcal{D}(\mathcal{A})$ of chain complexes of R-modules. Since R is commutative, we can regard Mod_R as a symmetric monoidal ∞-category. In this section, we will show that the symmetric monoidal structure on Mod_R is determined by the symmetric monoidal structure on the ordinary category $\mathrm{Ch}(\mathcal{A})$ of chain complexes with values in $\mathcal{A}$.

We begin with a much more general question. Given a stable ∞-category $\mathcal{C}$ (such as the derived ∞-category $\mathcal{D}(\mathcal{A})$ of an abelian category $\mathcal{A}$), under what circumstances can $\mathcal{C}$ be realized as the ∞-category RMod_R of right modules over an $\mathbb{E}_1$-ring R? This question is addressed by the following result of Schwede and Shipley:

Theorem 7.1.2.1. *[Schwede-Shipley [129]] Let $\mathcal{C}$ be a stable ∞-category. Then $\mathcal{C}$ is equivalent to RMod_R, for some $\mathbb{E}_1$-ring R, if and only if $\mathcal{C}$ is presentable and there exists a compact object $C \in \mathcal{C}$ which generates $\mathcal{C}$ in the following sense: if $D \in \mathcal{C}$ is an object having the property that $\mathrm{Ext}^n_{\mathcal{C}}(C, D) \simeq 0$ for all $n \in \mathbf{Z}$, then $D \simeq 0$.*

Proof. Suppose first that $\mathcal{C} \simeq \mathrm{RMod}_R$, and let $C = R$ (regarded as a left module over itself). Then $\mathcal{C}$ is presentable, C is a compact object of $\mathcal{C}$, and $\mathrm{Ext}^n_{\mathcal{C}}(C, D) \simeq \pi_{-n} D$ for every object $D \in \mathcal{C}$. It follows that $D \simeq 0$ if and only if $\mathrm{Ext}^n_{\mathcal{C}}(C, D) \simeq 0$ for all integers n, so that C generates $\mathcal{C}$.

Conversely, suppose that $\mathcal{C}$ is presentable and let $C \in \mathcal{C}$ be a compact generator. Let $\mathcal{P}\mathrm{r}^{\mathrm{L}}$ denote the symmetric monoidal ∞-category of presentable ∞-categories, so that we can regard $\mathcal{C}$ as a right module over the ∞-category Sp (see Proposition 4.8.2.18). We will complete the proof by showing that the pair $(\mathcal{C}, C)$ lies in the image of the fully faithful embedding $\mathrm{Alg}(\mathrm{Sp}) \to \mathrm{Mod}_{\mathrm{Sp}}(\mathcal{P}\mathrm{r}^{\mathrm{L}})_{\mathrm{Sp}/}$ of Proposition 4.8.5.8. Corollary HTT.5.5.2.9 guarantees that the functor $F : \mathrm{Sp} \to \mathcal{C}$ given by $X \mapsto X \otimes C$ admits a right adjoint G. According to Proposition 4.8.5.8, it will suffice to show the following:

小红书 小红书号:3189205503 qq

(a) The functor G preserves geometric realizations of simplicial objects.

(b) The functor G is conservative.

(c) For every object $D \in \mathcal{C}$ and every spectrum $X \in \mathrm{Sp}$, the canonical map $\theta_X : X \otimes G(D) \to G(X \otimes D)$ is an equivalence of spectra.

To prove (a), it suffices to show that G preserves all small colimits. Since G is exact, this is equivalent to the requirement that G preserves small filtered colimits, which follows from our assumption that C is compact. To prove (b), suppose we are given a map $\alpha : D \to D'$ such that $G(\alpha)$ is an equivalence. Let D'' be the cofiber of α. Since G is exact, we deduce that $G(D'') \simeq 0$, so that $\pi_n G(D'') \simeq \mathrm{Ext}_{\mathcal{C}}^{-n}(C, D'')$ vanishes for every integer n. Our assumption that C generates $\mathcal{C}$ implies that $D'' \simeq 0$, so that α is an equivalence.

It remains to prove (c). Fix an object $D \in \mathcal{C}$, and let $\mathcal{X} \subseteq \mathrm{Sp}$ be the full subcategory spanned by those spectra X for which the map θ_X is an equivalence. Since G preserves small colimits, the ∞-category $\mathcal{X} \subseteq \mathrm{Sp}$ is stable under small colimits. To prove that $\mathcal{X} = \mathrm{Sp}$, it suffices to show that $S[n] \in \mathcal{X}$ for every integer n, where S denotes the sphere spectrum. Since the functor G is exact, we can reduce to the case $n = 0$, where the result is obvious. □

Remark 7.1.2.2. Let $\mathcal{C}$ be a stable ∞-category, and let $X \in \mathcal{C}$ be an object. Then it is possible to extract from $\mathcal{C}$ an $\mathbb{E}_1$-ring spectrum $\mathrm{End}_{\mathcal{C}}(X)$ with the property that $\pi_n \mathrm{End}_{\mathcal{C}}(X) \simeq \mathrm{Ext}_{\mathcal{C}}^{-n}(X, X)$ for all $n \in \mathbf{Z}$, and the ring structure on $\pi_* \mathrm{End}_{\mathcal{C}}(X)$ is given by composition in the triangulated category $\mathrm{h}\mathcal{C}$. We will describe the argument in the case where $\mathcal{C}$ is presentable (the general case can be reduced to this case by first replacing $\mathcal{C}$ by a small subcategory which contains X, and then enlarging $\mathcal{C}$ by formally adjoining filtered colimits). According to Remark 4.8.2.20, the ∞-category $\mathcal{C}$ is naturally left-tensored over Sp. Proposition 4.2.1.33 implies that $\mathcal{C}$ is also enriched over Sp, so that there exists a morphism object $\mathrm{Mor}_{\mathcal{C}}(X, X)$. The object $\mathrm{End}_{\mathcal{C}}(X) = \mathrm{Mor}_{\mathcal{C}}(X, X)$ can be lifted to a final object of the monoidal ∞-category $\mathcal{C}^+[X]$, and can therefore be lifted to $\mathrm{Alg}(\mathrm{Sp}) \simeq \mathrm{Alg}_{\mathbb{E}_1}(\mathrm{Sp})$. The identification of the homotopy groups of $\mathrm{End}_{\mathcal{C}}(X)$ follows from the homotopy equivalence $\mathrm{Map}_{\mathrm{Sp}}(S[n], \mathrm{End}_{\mathcal{C}}(X)) \simeq \mathrm{Map}_{\mathcal{C}}(S[n] \otimes X, X)$.

Remark 7.1.2.3. Let $\mathcal{C}$ be a presentable stable ∞-category containing an object C. The $\mathbb{E}_1$-ring R appearing in the proof of Theorem 7.1.2.1 can be identified with the endomorphism algebra $\mathrm{End}_{\mathcal{C}}(C)$ described in Remark 7.1.2.2.

In the situation of Theorem 7.1.2.1, the $\mathbb{E}_1$-ring R is determined up to equivalence by the pair $(\mathcal{C}, C)$, but not by the ∞-category $\mathcal{C}$ alone. As in classical Morita theory, an equivalence between module categories RMod_R and $\mathrm{RMod}_{R'}$ need not result from an equivalence between R and R'. However, every equivalence between RMod_R and $\mathrm{RMod}_{R'}$ is obtained by tensor product with a suitable R-R'-bimodule spectrum. In fact, we have the following more general result:

小红书
小红书号:3189205503 qq

Proposition 7.1.2.4. *Let R and R' be $\mathbb{E}_1$-rings, and let $\mathrm{LFun}(\mathrm{RMod}_R, \mathrm{RMod}_{R'})$ be the ∞-category of functors from RMod_R to $\mathrm{RMod}_{R'}$ which preserve small colimits. Then the relative tensor product functor $\otimes_R : \mathrm{RMod}_R \times {}_R\mathrm{BMod}_{R'}(\mathrm{Sp}) \to \mathrm{RMod}_{R'}$ induces an equivalence of ∞-categories*

$$ {}_R\mathrm{BMod}_{R'}(\mathrm{Sp}) \to \mathrm{LFun}(\mathrm{RMod}_R, \mathrm{RMod}_{R'}).$$

Proof. Combine Proposition 4.8.2.18, Theorem 4.8.4.1, and Theorem 4.3.2.7. □

If we wish to recover the $\mathbb{E}_1$-ring from the ∞-category RMod_R of right R-modules, we should consider not only RMod_R but also the distinguished object R (regarded as a right module over itself), whose endomorphism algebra can be identified with R. More generally, for any $k \geq 1$, we can recover an $\mathbb{E}_k$-ring R from the ∞-category of right R-modules, regarded as an $\mathbb{E}_{k-1}$-monoidal ∞-category. Before stating the precise result, we need to introduce a bit of terminology.

Notation 7.1.2.5. Fix a section s of the trivial Kan fibration $\mathbb{E}_1^{\otimes} \to \mathrm{Assoc}^{\otimes}$ of Example 5.1.0.7, so that composition with s determines a map of ∞-operads $\mathcal{RM}^{\otimes} \to \mathbb{E}_1^{\otimes}$ and therefore a bifunctor of ∞-operads $\mathcal{RM}^{\otimes} \times \mathbb{E}_{k-1}^{\otimes} \to \mathbb{E}_k^{\otimes}$ for each $k > 0$. If $\mathcal{C}$ is an $\mathbb{E}_k$-monoidal ∞-category and $R \in \mathrm{Alg}_{/\mathbb{E}_k}(\mathcal{C})$, then we let $\mathrm{RMod}_R(\mathcal{C})$ denote the fiber product $\mathrm{Alg}_{\mathcal{RM}/\mathbb{E}_k}(\mathcal{C}) \times_{\mathrm{Alg}_{\mathrm{Assoc}/\mathbb{E}_k}} \{R\}$. If we assume that $\mathcal{C}$ admits geometric realizations of simplicial objects and that the tensor product on $\mathcal{C}$ preserves geometric realizations of simplicial objects, then the constructions of §4.8.3 show that $\mathrm{RMod}_R(\mathcal{C})$ inherits the structure of an $\mathbb{E}_{k-1}$-monoidal ∞-category.

Proposition 7.1.2.6. *Let $k \geq 1$. The construction $R \mapsto \mathrm{RMod}_R^{\otimes}$ determines a fully faithful embedding from the ∞-category $\mathrm{Alg}^{(k)}$ of $\mathbb{E}_k$-rings to the ∞-category $\mathrm{Alg}_{\mathbb{E}_{k-1}}(\mathcal{P}\mathrm{r}^{\mathrm{L}})$ of $\mathbb{E}_{k-1}$-monoidal presentable ∞-categories. An $\mathbb{E}_{k-1}$-monoidal ∞-category $\mathcal{C}^{\otimes} \to \mathbb{E}_{k-1}^{\otimes}$ belongs to the essential image of this embedding if and only if the following conditions are satisfied:*

(1) *The ∞-category $\mathcal{C}$ is stable and presentable, and if $k > 1$ then the tensor product functor $\otimes : \mathcal{C} \times \mathcal{C} \to \mathcal{C}$ preserves small colimits separately in each variable.*

(2) *The unit object $\mathbf{1} \in \mathcal{C}$ is compact.*

(3) *The object $\mathbf{1}$ generates $\mathcal{C}$ in the following sense: if $C \in \mathcal{C}$ is an object such that $\mathrm{Ext}^i_{\mathcal{C}}(\mathbf{1}, C) \simeq 0$ for all integers i, then $C \simeq 0$.*

Proof. The full faithfulness follows from Corollary 5.1.2.6 and Proposition 4.8.2.18. The description of the essential image follows as in the proof of Theorem 7.1.2.1. □

Proposition 7.1.2.6 is also valid (with the same proof) in the the limiting case $k = \infty$:

Proposition 7.1.2.7. *The construction $R \mapsto \mathrm{Mod}_R^{\otimes}$ determines a fully faithful embedding from the ∞-category CAlg of $\mathbb{E}_\infty$-rings to the ∞-category $\mathrm{CAlg}(\mathcal{P}\mathrm{r}^{\mathrm{L}})$ of presentable symmetric monoidal ∞-categories. A symmetric monoidal ∞-category $\mathcal{C}^{\otimes}$ belongs to the essential image of this embedding if and only if the following conditions are satisfied:*

小红书
小红书号:3189205503 qq

(1) *The ∞-category $\mathcal{C}$ is stable and presentable and the tensor product functor $\otimes : \mathcal{C} \times \mathcal{C} \to \mathcal{C}$ preserves small colimits separately in each variable.*

(2) *The unit object $\mathbf{1} \in \mathcal{C}$ is compact.*

(3) *The object $\mathbf{1}$ generates $\mathcal{C}$ in the following sense: if $C \in \mathcal{C}$ is an object such that $\mathrm{Ext}^i_{\mathcal{C}}(\mathbf{1}, C) \simeq 0$ for all integers i, then $C \simeq 0$.*

Our next goal is to use Proposition 7.1.2.7 to address the question raised at the beginning of this section. Suppose that R is a commutative ring, and let $\mathcal{A}$ be the category of chain complexes of R-modules. We will show that the equivalence of ∞-categories $\mathcal{D}(\mathcal{A}) \simeq \mathrm{Mod}_R$ provided by Remark 7.1.1.16 can be promoted to an equivalence of symmetric monoidal ∞-categories. To formulate this result more precisely, we need to define a suitable symmetric monoidal structure on $\mathcal{D}(\mathcal{A})$. Roughly speaking, it is given by the tensor product of chain complexes over R. To analyze this tensor product more explicitly, it is convenient to introduce an appropriate model structure on $\mathrm{Ch}(\mathcal{A})$.

Proposition 7.1.2.8. *Let R be an associative ring and let $\mathcal{A}$ be the abelian category of (discrete) right R-modules. Then the category $\mathrm{Ch}(\mathcal{A})$ admits a left proper combinatorial model structure, which can be described as follows:*

(W) *A map of chain complexes $f : M_* \to N_*$ is a weak equivalence if it is a quasi-isomorphism: that is, if it induces an isomorphism on homology.*

(F) *A map of chain complexes $f : M_* \to N_*$ is a fibration if each of the maps $M_i \to N_i$ is surjective.*

(C) *A map of chain complexes $f : M_* \to N_*$ is a cofibration if and only if it has the left lifting property with respect to every map g which is simultaneously a fibration and a weak equivalence.*

Proof. For every integer n, we let $E(n)_*$ denote the chain complex

$$\cdots \to 0 \to R \xrightarrow{\mathrm{id}} R \to 0 \to \cdots$$

which is nontrivial only in degrees n and $n-1$, and we let $\partial E(n)_*$ denote the subcomplex consisting of the module R concentrated in degree $n-1$. Let C_0 be the collection of all monomorphisms of chain complexes $\{\partial E(n)_* \hookrightarrow E(n)_*\}_{n \in \mathbf{Z}}$. Let C be the smallest weakly saturated collection of morphisms containing C_0. We first show that that there is a model structure on $\mathrm{Ch}(\mathcal{A})$ whose class of cofibrations is given by C and whose weak equivalences are quasi-isomorphisms. For this, it suffices to verify the hypotheses of Proposition HTT.A.2.6.15 .

Note that every morphism in C is a cofibration with respect to the model structure of Proposition 1.3.5.3. It follows from Proposition 1.3.5.3 that the class of weak equivalences in $\mathrm{Ch}(\mathcal{A})$ is perfect

小红书
小红书号:3189205503 qq

and is stable under pushouts by morphisms in C. It therefore suffices to show that if $f : M_* \to N_*$ is a morphism which has the right lifting property with respect to every morphism in C_0, then f is a quasi-isomorphism. Unwinding the definitions, our assumption guarantees that if $x \in N_i$ and $y \in M_{i-1}$ satisfy $f(y) = dx$, then there exists an element $\overline{x} \in M_i$ with $d\overline{x} = y$ and $f(\overline{x}) = x$. Taking x to be an arbitrary cycle and $y = 0$, we deduce that f induces a surjection $\mathrm{H}_i(M) \to \mathrm{H}_i(N)$. To prove injectivity, choose a homology class $\eta \in \mathrm{H}_i(M)$ represented by $y \in M_i$, and suppose that the image of η in $\mathrm{H}_i(N)$ vanishes. Then $f(y) = dx$ for some $x \in M_{i+1}$, and our hypothesis guarantees the existence of an element $\overline{x} \in M_{i+1}$ with $d\overline{x} = y$, so that $\eta = 0$ as desired.

To complete the proof, it suffices to show that the model structure we have constructed satisfies the requirements of Proposition 7.1.2.8: that is, we must show that a map $f : M_* \to N_*$ is a fibration if and only if it is degreewise surjective. Assume first that f is a fibration. We wish to show that for every integer n, f has the right lifting property with respect to the inclusion $g : 0 \hookrightarrow E(n)_*$. The map g is clearly a quasi-isomorphism. Moreover, g can be obtained as a composition of maps

$$0 \xrightarrow{g'} \partial\, E(n)_* \xrightarrow{g''} E(n)_*$$

where g'' belongs to C_0 and g' is a pushout of the morphism $\partial\, E(n-1)_* \to E(n-1)_*$ belonging to C_0. It follows that g is a trivial cofibration, so that f has the right lifting property with respect to g by virtue of our assumption that f is a fibration.

Now suppose that $f : M_* \to N_*$ is degreewise surjective; we wish to show that f is a fibration. Let $g : P_* \to Q_*$ be a trivial cofibration in $\mathrm{Ch}(\mathcal{A})$. For every pair of chain complexes of right R-modules X_* and Y_*, let $\mathrm{Map}(X_*, Y_*)$ be the chain complex of abelian groups given by Definition 1.3.2.1. We wish to show that the map

$$\phi : \mathrm{Map}(Q_*, M_*)_* \to \mathrm{Map}(P_*, M_*)_* \times_{\mathrm{Map}(P_*, N_*)_*} \mathrm{Map}(Q_*, N_*)_*$$

is surjective on 0-cycles. Since g is a trivial cofibration, each of the maps $P_n \to Q_n$ is a split monomorphism, and each quotient $F_n = Q_n / P_n$ is a projective right R-module. We therefore obtain a diagram of exact sequences (of chain complexes of abelian groups)

$$\begin{array}{ccccccccc} 0 & \longrightarrow & \mathrm{Map}(F_*, M_*)_* & \longrightarrow & \mathrm{Map}(Q_*, M_*)_* & \longrightarrow & \mathrm{Map}(P_*, M_*)_* & \longrightarrow & 0 \\ & & \downarrow{\scriptstyle \theta} & & \downarrow & & \downarrow & & \\ 0 & \longrightarrow & \mathrm{Map}(F_*, N_*)_* & \longrightarrow & \mathrm{Map}(Q_*, N_*)_* & \longrightarrow & \mathrm{Map}(P_*, N_*)_*. & \longrightarrow & 0 \end{array}$$

Since F_* is degreewise projective and f is degreewise surjective, the map θ is an epimorphism. It follows from a diagram chase that the map ϕ degreewise surjective, and that $\ker(\phi) \simeq \ker(\theta)$. Let $K_* = \ker(\phi)$, so that $K_* \simeq \mathrm{Map}(F_*, \ker(f))$. Let x be a 0-cycle in $\mathrm{Map}(P_*, M_*)_* \times_{\mathrm{Map}(P_*, N_*)_*} \mathrm{Map}(Q_*, N_*)_*$, and write $x = \phi(\widetilde{x})$ for $\widetilde{x} \in \mathrm{Map}(Q_*, M_*)_0$. Then $d\widetilde{x}$ is a (-1)-cycle of K. If we can write $d\widetilde{x} = dy$ for some $y \in K_0$, then $\widetilde{x} - y$ is a 0-cycle of $\mathrm{Map}(Q_*, M_*)$ lifting x. It will therefore

小红书 小红书号:3189205503 qq

suffice to show that the chain complex K_* is acyclic. For this, it suffices to show that the chain complex F_* has a contracting homotopy.

We will prove the following more general assertion: for every cofibrant object $Z_* \in \mathrm{Ch}(\mathcal{A})$ and every map of chain complexes $u : Z_* \to F_*$, where exists a nullhomotopy for u: that is, a collection of maps $h : Z_m \to F_{m+1}$ satisfying $dh + hd = u$. Taking u to be the identity map id_{F_*}, we will obtain the desired result. Without loss of generality we may assume that Z_* is the colimit of a transfinite sequence of chain complexes

$$0 = Z(0)_* \to Z(1)_* \to Z(2)_* \to \cdots$$

where each of the maps $Z(\alpha)_* \to Z(\alpha+1)_*$ is the pushout of an inclusion $\partial E(n_\alpha)_* \hookrightarrow E(n_\alpha)_*$. We construct a compatible family of maps $h_\alpha : Z(\alpha)_m \to F_{m+1}$ satisfying $dh_\alpha + h_\alpha d = u|Z(\alpha)_m$ using induction on α. When α is a limit ordinal (including the case $\alpha = 0$), there is nothing to prove. Let us therefore assume that h_α has been constructed, and explain how to define $h_{\alpha+1}$. By assumption, the chain complex $Z(\alpha+1)_*$ is freely generated by $Z(\alpha)_*$ together with an additional element x in degree n_α, satisfying $dx = y \in Z(\alpha)_{n_\alpha - 1}$. The element $u(x) - h_\alpha(y) \in F_{n_\alpha}$ satisfies

$$d(u(x) - h_\alpha(y)) = u(dx) - dh_\alpha(y) - h_\alpha(dy) = u(y) - u(y) = 0,$$

so that $u(x) - h_\alpha(y)$ is a cycle. Since $g : P_* \to Q_*$ is a trivial cofibration, the chain complex F_* is acyclic. We may therefore find an element $z \in F_{n_\alpha + 1}$ with $dz = u(x) - h_\alpha(y)$. We now complete the construction by defining $h_{\alpha+1}$ so that $h_{\alpha+1}(x) = z$ and $h_{\alpha+1}|Z(\alpha)_* = h_\alpha$. □

Remark 7.1.2.9. Let R be an associative ring and $\mathcal{A}$ the abelian category of (discrete) R-modules. We will refer to the model structure on $\mathrm{Ch}(\mathcal{A})$ described in Proposition 7.1.2.8 as the *projective model structure* on the category $\mathrm{Ch}(\mathcal{A})$. It generally does *not* agree with the model structure of Proposition 1.3.5.3. However, these model structures have the same weak equivalences. It follows that the underlying ∞-category of $\mathrm{Ch}(\mathcal{A})$ does not depend on which model structure we consider (it is the ∞-category obtained from $\mathrm{Ch}(\mathcal{A})$ by formally inverting all weak equivalences). We will denote this ∞-category by $\mathcal{D}(\mathcal{A})$ in what follows.

Remark 7.1.2.10. Let R be a field (not necessarily commutative). Then for every monomorphism $M \to N$ of right R-modules, the inclusion of the chain complex

$$\cdots \to 0 \to M \to N \to 0 \to \cdots$$

into

$$\cdots \to 0 \to N \xrightarrow{\mathrm{id}} N \to 0 \to \cdots$$

is a pushout of coproducts of generating cofibrations appearing in Proposition 7.1.2.8. It follows that the model structures of Propositions 1.3.5.3 and 7.1.2.8 coincide. In particular, every object of $\mathrm{Ch}(\mathcal{A})$ is cofibrant with respect to the projective model structure.

小红书
小红书号:3189205503 qq

Proposition 7.1.2.11. *Let R be a commutative ring, let $\mathcal{A}$ denote the abelian category of (discrete) R-modules, and regard $\mathrm{Ch}(\mathcal{A})$ as a symmetric monoidal category via the tensor product of chain complexes (see Remark 1.2.3.21). Then $\mathrm{Ch}(\mathcal{A})$ is a symmetric monoidal model category, with respect to the projective model structure of Proposition 7.1.2.8.*

Proof. It is easy to see that the unit object of $\mathrm{Ch}(\mathcal{A})$ (given by the module R, considered as a chain complex concentrated in degree zero) is cofibrant. Suppose we are given cofibrations $f : M_* \to M'_*$ and $g : N_* \to N'_*$; we must show that the induced map

$$f \wedge g : (M_* \otimes N'_*) \coprod_{M_* \otimes N_*} (M'_* \otimes N_*) \to M'_* \otimes N'_*$$

is a cofibration, which is trivial if either f or g is trivial. We first show that $f \wedge g$ is a cofibration. Without loss of generality, we may assume that both f and g are generating cofibrations, having the form

$$\partial\, E(m)_* \to E(m)_* \qquad \partial\, E(n)_* \to E(n)_*$$

for some integers m and n (for an explanation of this notation, see the proof of Proposition 7.1.2.8). Unwinding the definitions, we see that $f \wedge g$ is a pushout of the generating cofibration $\partial\, E(m+n)_* \to E(m+n)_*$, and therefore a cofibration.

Now suppose that f is a trivial cofibration; we wish to show that $f \wedge g$ is a trivial cofibration. If we regard f as fixed, then the collection of morphisms g for which $f \wedge g$ is a trivial cofibration is weakly saturated. We may therefore assume that g is a generating trivial cofibration of the form $\partial\, E(n)_* \to E(n)_*$. In this case, the map $f \wedge g$ is an injection whose cokernel is isomorphic (after a shift) to the cokernel of f. Since f is a quasi-isomorphism which is degreewise injective, the chain complex $\mathrm{coker}(f)$ is acyclic, so that $f \wedge g$ is also a quasi-isomorphism. □

Remark 7.1.2.12. Combining Proposition 7.1.2.11 with Example 4.1.7.6, we conclude that if $\mathcal{A}$ is the abelian category of modules over a commutative ring R, then the derived ∞-category $\mathcal{D}(\mathcal{A})$ inherits a symmetric monoidal structure. This symmetric monoidal structure is determined uniquely (up to equivalence) by the requirement that the functor $\mathrm{N}(\mathrm{Ch}(\mathcal{A})^{\circ}) \to \mathcal{D}(\mathcal{A})$ can be promoted to a symmetric monoidal functor; here $\mathrm{Ch}(\mathcal{A})^{\circ}$ denotes the full subcategory of $\mathrm{Ch}(\mathcal{A})$ spanned by those objects which are cofibrant with respect to the model structure of Proposition 7.1.2.8.

We are now ready to address the question raised at the beginning of this section.

Theorem 7.1.2.13. *Let R be a commutative ring, let $\mathcal{A}$ denote the abelian category of R-modules, and regard R as a discrete $\mathbb{E}_\infty$-ring. Then there is a canonical equivalence of symmetric monoidal ∞-categories $\mathrm{Mod}_R \to \mathcal{D}(\mathcal{A})$; here we regard $\mathcal{D}(\mathcal{A})$ as a symmetric monoidal ∞-category as in Remark 7.1.2.12.*

小红书
小红书号:3189205503 qq

Proof. The ∞-category $\mathcal{D}(\mathcal{A})$ is presentable by Proposition 1.3.4.22, and the tensor product on $\mathcal{D}(\mathcal{A})$ preserves colimits separately in each variable since it is induced by a left Quillen bifunctor. The ∞-category $\mathcal{D}(\mathcal{A})$ is stable by Remark 7.1.2.9 and the results of §1.3.2. Let R be the unit object of $\mathcal{D}(\mathcal{A})$. For any $M_* \in \mathcal{D}(\mathcal{A})$, we have canonical equivalences $\mathrm{H}_n(M) \simeq \mathrm{Ext}^{-n}_{\mathcal{D}(\mathcal{A})}(R, M_*)$. It follows that R is a compact generator for $\mathcal{D}(\mathcal{A})$, so that Proposition 7.1.2.7 yields a symmetric monoidal equivalence $\mathcal{D}(\mathcal{A}) \simeq \mathrm{Mod}_A$ for some $\mathbb{E}_\infty$-ring A. Here we can regard A as the endomorphism algebra of $R \in \mathcal{D}(\mathcal{A})$, so that

$$\pi_n A \simeq \mathrm{Ext}^{-n}_{\mathcal{D}(\mathcal{A})}(R, R) \simeq \begin{cases} R & \text{if } n = 0 \\ 0 & \text{otherwise.} \end{cases}$$

In particular, we deduce that A is a discrete $\mathbb{E}_\infty$-ring which can be identified with R, so that we have a symmetric monoidal equivalence $\mathcal{D}(\mathcal{A}) \simeq \mathrm{Mod}_R$. □

7.1.3 Change of Ring

Let $\mathcal{A}b$ denote the category of abelian groups and let $R \in \mathrm{CAlg}(\mathcal{A}b)$ be a commutative ring. Suppose that A is an R-algebra: that is, an associative ring equipped with a map $\phi : R \to A$ whose image is contained in the center of A. Suppose that M is a left A-module. We may then regard M as an R-module (via the homomorphism ϕ). The action of A on M is determined by a map of abelian groups $\phi : A \otimes M \to M$. This map is R-bilinear: for every triple of elements $a \in A$, $x \in M$, and $\lambda \in R$, we have

$$\lambda(ax) = (\lambda a)x = (a\lambda)x = a(\lambda x).$$

It follows that the map ϕ factors through the relative tensor product $A \otimes_R M$. We can rephrase this statement more categorically as follows: the associative ring A can be regarded as an associative algebra object of the category $\mathrm{Mod}_R(\mathcal{A}b)$ of R-modules, and M can be regarded as a left A-module object of the category $\mathrm{Mod}_R(\mathcal{A}b)$.

We begin this section by generalizing this observation to the ∞-categorical setting. Let $\mathcal{C}$ be a symmetric monoidal ∞-category and let $R \in \mathrm{CAlg}(\mathcal{C})$ be a commutative algebra object of $\mathcal{C}$. Under some mild assumptions, the ∞-category $\mathrm{Mod}_R(\mathcal{C})$ of R-module objects of $\mathcal{C}$ inherits the structure of a symmetric monoidal ∞-category. Moreover, the forgetful functor $\mathrm{Mod}_R(\mathcal{C}) \to \mathcal{C}$ is lax symmetric monoidal. It follows that every algebra object $A \in \mathrm{Alg}(\mathrm{Mod}_R(\mathcal{C}))$ determines an algebra $A' \in \mathrm{Alg}(\mathcal{C})$, and we have a forgetful functor $\mathrm{LMod}_A(\mathrm{Mod}_R(\mathcal{C})) \to \mathrm{LMod}_{A'}(\mathcal{C})$. We will show that this forgetful functor is an equivalence of ∞-categories. In fact, we do not even need to assume that the tensor product on $\mathcal{C}$ is fully commutative.

Theorem 7.1.3.1. *Let $\mathcal{C}$ be an $\mathbb{E}_2$-monoidal ∞-category. Assume that $\mathcal{C}$ admits geometric realizations of simplicial objects and that the tensor product on $\mathcal{C}$ preserves geometric realizations separately in each variable. Let $R \in \mathrm{Alg}_{/\mathbb{E}_2}(\mathcal{C}) \simeq \mathrm{Alg}_{/\mathbb{E}_1}(\mathrm{Alg}_{/\mathbb{E}_1}(\mathcal{C}))$, so that the ∞-category $\mathrm{LMod}_R(\mathcal{C})$ inherits an $\mathbb{E}_1$-monoidal structure. For every algebra object $A \in \mathrm{Alg}_{/\mathbb{E}_1}(\mathrm{LMod}_R(\mathcal{C}))$ having image*

小红书
小红书号:3189205503 qq

$A' \in \mathrm{Alg}_{\mathbb{E}_1/\mathbb{E}_2}(\mathcal{C})$, *the forgetful functor* $\theta : \mathrm{LMod}_A(\mathrm{LMod}_R(\mathcal{C})) \to \mathrm{LMod}_{A'}(\mathcal{C})$ *is an equivalence of* ∞*-categories.*

Remark 7.1.3.2. With a bit more care, the conclusion of Theorem 7.1.3.1 remains valid for an arbitrary fibration of ∞-operads $p : \mathcal{C}^{\otimes} \to \mathbb{E}_2^{\otimes}$: we do not need to assume that p is a coCartesian fibration or that p is compatible with $\mathrm{N}(\mathbf{\Delta})^{\mathrm{op}}$-indexed colimits. This more general statement can be reduced to the statement of Theorem 7.1.3.1 by first replacing p by its $\mathbb{E}_2$-monoidal envelope (see §2.2.4) and then using Proposition 4.8.1.10.

Proof. In what follows, it will be convenient to think of the $\mathbb{E}_2$-monoidal structure on $\mathcal{C}$ as giving determining two tensor product operations $\otimes, \boxtimes : \mathcal{C} \times \mathcal{C} \to \mathcal{C}$, which are coherently associative and commute with one another. The operations $\otimes$ and $\boxtimes$ can be identified with one another by the Eckmann-Hilton argument (see Example 5.1.2.4), but the argument will be clearer if we do not exploit this.

We have a diagram of forgetful functors

$$\begin{array}{ccc} \mathrm{LMod}_A(\mathrm{LMod}_R(\mathcal{C})) & \xrightarrow{\theta} & \mathrm{LMod}_{A'}(\mathcal{C}) \\ & {\scriptstyle G} \searrow \quad \swarrow {\scriptstyle G'} & \\ & \mathcal{C} & \end{array}$$

To show that θ is an equivalence of ∞-categories, it will suffice to show that this diagram satisfies the hypotheses of Corollary 4.7.3.16. Using Corollaries 4.2.3.2 and 4.2.3.5, we deduce that G and G' are conservative and preserve geometric realizations of simplicial objects. Corollary 4.2.4.8 implies that G' admits a left adjoint F', given informally by $M \mapsto A' \otimes M$. The functor G factors as a composition

$$\mathrm{LMod}_A(\mathrm{LMod}_R(\mathcal{C})) \xrightarrow{G_1} \mathrm{LMod}_R(\mathcal{C}) \xrightarrow{G_2} \mathcal{C}\,.$$

Using Corollary 4.2.4.8 again, we deduce that these functors admit left adjoints F_1 and F_2. The functor F_2 is given by $M \mapsto R \boxtimes M$, and Lemma 4.8.3.15 shows that the functor F_1 is given by $N \mapsto R \boxtimes_{R \otimes R} (A \otimes N)$. It follows that G admits a left adjoint $F = F_1 \circ F_2$. To complete the proof, it will suffice to show that for each $M \in \mathcal{C}$, the canonical map $F'(M) \to \theta F(M)$ is an equivalence in $\mathrm{LMod}_{A'}(\mathcal{C})$. Unwinding the definitions, we must show that the canonical map

$$\alpha : A \otimes M \to R \boxtimes_{R \otimes R} (A \otimes (R \boxtimes N))$$

is an equivalence in $\mathcal{C}$. We note that α factors as a composition of equivalences

$$A \otimes M \simeq R \boxtimes_R (A \otimes M) \simeq R \boxtimes_{R \otimes \mathbf{1}} (A \otimes (\mathbf{1} \boxtimes M)) \simeq R \boxtimes_{R \otimes R} (A \otimes (R \boxtimes M)).$$

□

The equivalences in Theorem 7.1.3.1 are compatible with the formation of relative tensor products:

小红书 小红书号:3189205503 qq

Proposition 7.1.3.3. *Let $\mathcal{C}$ be an $\mathbb{E}_2$-monoidal ∞-category. Assume that $\mathcal{C}$ admits geometric realizations of simplicial objects and that the tensor product on $\mathcal{C}$ preserves geometric realizations separately in each variable. Let $R \in \mathrm{Alg}_{/\mathbb{E}_2}(\mathcal{C}) \simeq \mathrm{Alg}_{/\mathbb{E}_1}(\mathrm{Alg}_{/\mathbb{E}_1}(\mathcal{C}))$, so that the ∞-category $\mathrm{LMod}_R(\mathcal{C})$ inherits an $\mathbb{E}_1$-monoidal structure. Let $\theta : \mathrm{LMod}_R(\mathcal{C}) \to \mathcal{C}$ denote the forgetful functor. Suppose we are given an algebra object $A \in \mathrm{Alg}_{/\mathbb{E}_1}(\mathrm{LMod}_R(\mathcal{C}))$, and let A' be the image of A in $\mathrm{Alg}_{\mathbb{E}_1/\mathbb{E}_2}(\mathcal{C})$, so that θ induces forgetful functors $\theta_L : \mathrm{LMod}_A(\mathrm{LMod}_R(\mathcal{C})) \to \mathrm{LMod}_A(\mathcal{C})$ and $\theta_R : \mathrm{RMod}_A(\mathrm{LMod}_R(\mathcal{C})) \to \mathrm{RMod}_A(\mathcal{C})$ (which are equivalences of ∞-categories by Proposition 7.1.3.1). For every pair of objects $M \in \mathrm{RMod}_A(\mathrm{LMod}_R(\mathcal{C}))$, $N \in \mathrm{LMod}_A(\mathrm{LMod}_R(\mathcal{C}))$, the canonical map*

$$\phi_{M,N} : \theta_R(M) \otimes_{A'} \theta_L(N) \to \theta(M \otimes_A N)$$

is an equivalence in $\mathcal{C}$.

Proof. Let us regard $N \in \mathrm{LMod}_A(\mathrm{LMod}_R(\mathcal{C}))$ as fixed, and let $\mathcal{X} \subseteq \mathrm{RMod}_A(\mathrm{LMod}_R(\mathcal{C}))$ be the full subcategory spanned by those objects for which the map ϕ is an equivalence. Since the forgetful functor θ and the relative tensor product functors commute with geometric realization, we conclude that $\mathcal{X}$ is stable under geometric realizations in $\mathrm{RMod}_A(\mathrm{LMod}_R(\mathcal{C}))$. Using Proposition 4.7.3.14, we are reduced to proving that $\mathcal{X}$ contains the essential image of the functor F appearing in the proof of Theorem 7.1.3.1. Unwinding the definitions, we must show that if $M_0 \in \mathcal{C}$, then the canonical map

$$(M_0 \otimes A') \otimes_{A'} \theta_L(N) \to \theta((M_0 \otimes A) \otimes_A N)$$

is an equivalence. This is clear, since both sides can be identified with the absolute tensor product $M_0 \otimes N$. □

Corollary 7.1.3.4. *Let $k \geq 1$ be an integer and let $\mathcal{C}$ be an $\mathbb{E}_{k+1}$-monoidal ∞-category. Assume that $\mathcal{C}$ admits geometric realizations of simplicial objects and that the tensor product on $\mathcal{C}$ preserves geometric realizations of simplicial objects separately in each variable. Let R be an $\mathbb{E}_{k+1}$-algebra in $\mathcal{C}$, let $A \in \mathrm{Alg}_{/\mathbb{E}_k}(\mathrm{LMod}_R(\mathcal{C}))$, and let A' denote the image of A in $\mathrm{Alg}_{/\mathbb{E}_k}(\mathcal{C})$. Then the forgetful functor*

$$\mathrm{LMod}_A(\mathrm{LMod}_R(\mathcal{C})) \to \mathrm{LMod}_{A'}(\mathcal{C})$$

is an equivalence of $\mathbb{E}_{k-1}$-monoidal ∞-categories.

Proof. Combine Theorem 7.1.3.1, Proposition 7.1.3.3, and Theorem 4.4.1.28. □

We now specialize to the setting of structured ring spectra.

Definition 7.1.3.5. Let $k \geq 0$, and let $R \in \mathrm{Alg}^{(k+1)} = \mathrm{Alg}_{/\mathbb{E}_{k+1}}(\mathrm{Sp})$ be an $\mathbb{E}_{k+1}$-ring. We let LMod_R denote the ∞-category $\mathrm{LMod}_R(\mathrm{Sp})$ of left R-module spectra, which we regard as an $\mathbb{E}_{k+1}$-monoidal ∞-category. We let $\mathrm{Alg}_R^{(k)}$ denote the ∞-category $\mathrm{Alg}_{\mathbb{E}_k}(\mathrm{LMod}_R)$. We will refer to $\mathrm{Alg}_R^{(k)}$ as the *∞-category of $\mathbb{E}_k$-algebras over R.*

小红书
小红书号:3189205503 qq

Example 7.1.3.6. Let $R = S$ be the sphere spectrum, regarded as a trivial $\mathbb{E}_{k+1}$-algebra object of Sp. Then the forgetful functor $\mathrm{LMod}_R \to \mathrm{Sp}$ is an equivalence of $\mathbb{E}_k$-monoidal ∞-categories. It follows that the forgetful functor $\mathrm{Alg}^{(k)}_R \to \mathrm{Alg}^{(k)}$ is an equivalence: that is, an $\mathbb{E}_k$-algebra over the sphere spectrum is just an $\mathbb{E}_k$-ring, in the sense of Definition 7.1.0.1.

Remark 7.1.3.7. Let $0 \leq k$, let R be an $\mathbb{E}_{k+1}$-ring, and let A be an $\mathbb{E}_k$-algebra over R. We will generally abuse notation by identifying A with its image under the forgetful functor $\mathrm{Alg}^{(k)}_R \to \mathrm{Alg}^{(k)}$. Theorem 7.1.3.1 gives an equivalence of ∞-categories

$$\mathrm{LMod}_A(\mathrm{LMod}_R(\mathrm{Sp})) \simeq \mathrm{LMod}_A(\mathrm{Sp}),$$

which is $\mathbb{E}_{k-1}$-monoidal if $k > 0$ (by Corollary 7.1.3.4). Consequently, we may speak unambiguously about (left) A-module spectra and their relative tensor product over A, without making reference to the underlying $\mathbb{E}_{k+1}$-ring R.

Variant 7.1.3.8. Definition 7.1.3.5 continues to make sense in the special case $k = \infty$: if R is an $\mathbb{E}_\infty$-ring, then the ∞-category $\mathrm{Mod}_R(\mathrm{Sp}) \simeq \mathrm{LMod}_R(\mathrm{Sp})$ inherits a symmetric monoidal structure, so that the ∞-category $\mathrm{CAlg}(\mathrm{LMod}_R(\mathrm{Sp}))$ is well-defined. We will denote this ∞-category by CAlg_R and refer to its objects as *$\mathbb{E}_\infty$-algebras over R*. Using Theorem 5.1.4.10 and Proposition 3.4.1.4, we obtain a canonical equivalence of ∞-categories $\mathrm{CAlg}_R \simeq \mathrm{CAlg}_{R/}$: that is, we can identify an $\mathbb{E}_\infty$-algebra over R with an $\mathbb{E}_\infty$-ring A together with a map $R \to A$.

Warning 7.1.3.9. Let $k < \infty$ and let R be an $\mathbb{E}_{k+1}$-ring. We can identify the unit object of LMod_R with R itself, so there is an evident forgetful functor

$$\mathrm{Alg}^{(k)}_R \simeq (\mathrm{Alg}^{(k)}_R)_{R/} \to \mathrm{Alg}^{(k)}_{R/}$$

generalizing the equivalence described in Variant 7.1.3.8. However, this functor is generally *not* an equivalence: a map of $\mathbb{E}_k$-rings from R to another $\mathbb{E}_k$-ring A does not exhibit A as an $\mathbb{E}_k$-algebra object of LMod_R unless it factors through the center $\mathfrak{Z}_{\mathbb{E}_k}(A)$ (see Definition 5.3.1.12).

Let $0 \leq k \leq \infty$ and let R be a connective $\mathbb{E}_{k+1}$-ring. We will say that an $\mathbb{E}_k$-algebra $A \in \mathrm{Alg}^{(k)}_R$ is *connective* if its underlying spectrum is connective. We let $\mathrm{Alg}^{(k),\mathrm{cn}}_R$ denote the full subcategory of $\mathrm{Alg}^{(k)}_R$ spanned by the connective $\mathbb{E}_k$-algebras over R. Note that $\mathrm{Alg}^{(k),\mathrm{cn}}_R$ can be identified with the ∞-category of $\mathbb{E}_k$-algebra objects of the subcategory $\mathrm{LMod}^{\mathrm{cn}}_R \subseteq \mathrm{LMod}_R$. To study this notion, we need the following observation:

Lemma 7.1.3.10. *Let $0 \leq k \leq \infty$ and let R be a connective $\mathbb{E}_{k+1}$-ring. Then the t-structure on LMod_R (see Proposition 7.1.1.13) is compatible with the $\mathbb{E}_k$-monoidal structure.*

Proof. If $k = 0$, it suffices to show that the unit object of LMod_R is connective; this unit object is given by R, so the result is immediate. If $k \geq 1$, we must also show that for $M, N \in \mathrm{LMod}^{\mathrm{cn}}_R$, the tensor product $M \otimes_R N$ also belongs to $\mathrm{LMod}^{\mathrm{cn}}_R$. Since $\mathrm{LMod}^{\mathrm{cn}}_R$ is generated by R under small colimits, we can assume that $M = N = R$, in which case the result is obvious. $\square$

小红书
小红书号:3189205503 qq

For any object $A \in \mathrm{Alg}_R^{(k)}$, we can find a closest approximation to A which belongs to $\mathrm{Alg}_R^{(k),\mathrm{cn}}$.

Definition 7.1.3.11. Let R be a connective $\mathbb{E}_{k+1}$-ring for $0 \leq k \leq \infty$ and let $A \in \mathrm{Alg}_R^{(k)}$. A *connective cover* of A is a morphism $\phi : A' \to A$ of $\mathbb{E}_k$-algebras over R with the following properties:

(1) The $\mathbb{E}_k$-algebra A' is connective.

(2) For every connective object $A'' \in \mathrm{Alg}_R^{(k)}$, composition with ϕ induces a homotopy equivalence

$$\mathrm{Map}_{\mathrm{Alg}_R^{(k)}}(A'', A') \to \mathrm{Map}_{\mathrm{Alg}_R^{(k)}}(A'', A).$$

Remark 7.1.3.12. In the situation of Definition 7.1.3.11, we will generally abuse terminology and simply refer to A' as a connective cover of A, in the case where the map ϕ is implicitly understood.

Proposition 7.1.3.13. *Let $0 \leq k \leq \infty$, and let R be a connective $\mathbb{E}_{k+1}$-ring. Then:*

(1) *Every $\mathbb{E}_k$-algebra $A \in \mathrm{Alg}_R^{(k)}$ admits a connective cover.*

(2) *An arbitrary map $\phi : A' \to A$ of $\mathbb{E}_k$-algebras over R is a connective cover of A if and only if A' is connective and the induced map $\pi_n A' \to \pi_n A$ is an isomorphism for $n \geq 0$.*

(3) *The inclusion $\mathrm{Alg}_R^{(k),\mathrm{cn}} \subseteq \mathrm{Alg}_R^{(k)}$ admits a right adjoint G, which carries each $\mathbb{E}_k$-algebra $A \in \mathrm{Alg}_R^{(k)}$ to a connective cover A' of A.*

Proof of Proposition 7.1.3.13. Combine Proposition 2.2.1.1 with Lemma 7.1.3.10. □

Recall that an object X of an ∞-category $\mathcal{C}$ is said to be *n-truncated* if the mapping spaces $\mathrm{Map}_{\mathcal{C}}(Y, X)$ are n-truncated, for every $Y \in \mathcal{C}$ (see §HTT.5.5.6). Let R be a connective $\mathbb{E}_{k+1}$-ring for $0 \leq k \leq \infty$. Corollary 3.2.3.5 implies that the ∞-categories $\mathrm{Alg}_R^{(k)}$ and $\mathrm{Alg}_R^{(k),\mathrm{cn}}$ are presentable for $0 \leq k \leq \infty$, so we have a good theory of truncation functors.

Proposition 7.1.3.14. *Let $0 \leq k \leq \infty$, let R be a connective $\mathbb{E}_{k+1}$-ring, and let $A \in \mathrm{Alg}_R^{(k)}$. The following conditions are equivalent:*

(1) *As an object of $\mathrm{Alg}_R^{(k),\mathrm{cn}}$, A is n-truncated.*

(2) *As an object of $\mathrm{LMod}_R^{\mathrm{cn}}$, A is n-truncated.*

(3) *As an object of $\mathrm{Sp}^{\mathrm{cn}}$, A is n-truncated.*

(4) *The space $\Omega^\infty(R)$ is n-truncated.*

(5) *For every $m > n$, the homotopy group $\pi_m R$ is trivial.*

小红书
小红书号:3189205503 qq

Proof. The equivalence (4) $\Leftrightarrow$ (5) is easy (Remark HTT.5.5.6.4), and the equivalences (2) $\Leftrightarrow$ (3) $\Leftrightarrow$ (5) are explained in Warning 1.2.1.9. The implication (1) $\Rightarrow$ (2) follows from Proposition HTT.5.5.6.16 , since the forgetful functor $\mathrm{Alg}_R^{(k),\mathrm{cn}} \to \mathrm{LMod}_R^{\mathrm{cn}}$ preserves small limits (Corollary 3.2.2.5).

We now prove that (2) $\Rightarrow$ (1). Assume that A is n-truncated as a left R-module spectrum. Let $T : (\mathrm{Alg}^{(k),\mathrm{cn}})^{\mathrm{op}} \to \mathcal{S}$ be the functor represented by A. Let $\mathcal{C} \subseteq \mathrm{Alg}_R^{(k),\mathrm{cn}}$ be the full subcategory of $\mathrm{Alg}_R^{(k),\mathrm{cn}}$ spanned by those objects B such that $T(B)$ is n-truncated. We wish to prove that $\mathcal{C} = \mathrm{Alg}_R^{(k),\mathrm{cn}}$. Since T preserves limits (Proposition HTT.5.1.3.2) and the class of n-truncated spaces is stable under limits (Proposition HTT.5.5.6.5), we conclude that $\mathcal{C}$ is stable under small colimits in $\mathrm{Alg}_R^{(k),\mathrm{cn}}$. Let F be a left adjoint to the forgetful functor $\mathrm{Alg}_R^{(k),\mathrm{cn}} \to \mathrm{LMod}_R$. Proposition 4.7.3.14 implies that $\mathrm{Alg}_R^{(k),\mathrm{cn}}$ is generated under colimits by the essential image of F. Consequently, it will suffice to show that $F(M) \in \mathcal{C}$ for every $M \in \mathrm{LMod}_R$. Equivalently, we must show that the space $\mathrm{Map}_{\mathrm{Alg}_R^{(k),\mathrm{cn}}}(F(M), A) \simeq \mathrm{Map}_{\mathrm{LMod}_R}(M, A)$ is n-truncated, which follows from (2). □

Let R be a connective $\mathbb{E}_{k+1}$-ring, let $\tau_{\leq n} : \mathrm{LMod}_R^{\mathrm{cn}} \to \mathrm{LMod}_R^{\mathrm{cn}}$ be the truncation functor on connective left R-module spectra, and let $\tau_{\leq n}^{(k)} : \mathrm{Alg}_R^{(k),\mathrm{cn}} \to \mathrm{Alg}_R^{(k),\mathrm{cn}}$ be the truncation functor on connective $\mathbb{E}_k$-algebras over R. Since the forgetful functor $\theta : \mathrm{Alg}_R^{(k),\mathrm{cn}} \to \mathrm{LMod}_R^{\mathrm{cn}}$ preserves n-truncated objects, there is a canonical natural transformation $\alpha : \tau_{\leq n} \circ \theta \to \theta \circ \tau_{\leq n}^{(k)}$. Our next goal is to show that α is an equivalence.

Proposition 7.1.3.15. *Let $0 \leq k \leq \infty$, let R be a connective $\mathbb{E}_{k+1}$-ring, and let $n \geq 0$ be an integer. Then:*

(1) *The localization functor $\tau_{\leq n} : \mathrm{LMod}_R^{\mathrm{cn}} \to \mathrm{LMod}_R^{\mathrm{cn}}$ is compatible with the $\mathbb{E}_k$-monoidal structure on $\mathrm{LMod}_R^{\mathrm{cn}}$, in the sense of Definition 2.2.1.6.*

(2) *The $\mathbb{E}_k$-monoidal structure on $\mathrm{LMod}_R^{\mathrm{cn}}$ induces an $\mathbb{E}_k$-monoidal structure on the ∞-category*

$$\mathrm{LMod}_R^{\mathrm{cn}} \cap (\mathrm{LMod}_R)_{\leq n}$$

and an identification

$$\mathrm{Alg}_{/\mathbb{E}_k}(\mathrm{LMod}_R^{\mathrm{cn}} \cap (\mathrm{LMod}_R)_{\leq n}) \simeq \tau_{\leq n}^{(k)} \mathrm{Alg}_R^{(k),\mathrm{cn}}.$$

(3) *For every connective $\mathbb{E}_k$-algebra A over R, the map of left R-module spectra $\tau_{\leq n} A \to \tau_{\leq n}^{(k)} A$ described above is an equivalence.*

Proof. Assertion (1) follows from Proposition 2.2.1.8 and Lemma 7.1.3.10. Assertions (2) and (3) follow from (1) together with Proposition 2.2.1.9. □

More informally, Proposition 7.1.3.15 asserts that if A is connective $\mathbb{E}_k$-algebra over a connective $\mathbb{E}_{k+1}$-ring R, then for each $n \geq 0$ the truncation $\tau_{\leq n} A$ inherits the structure of an $\mathbb{E}_k$-algebra over R.

小红书
小红书号:3189205503 qq

Remark 7.1.3.16. Let $k \geq 1$ and let R be a connective $\mathbb{E}_{k+1}$-ring. The $\mathbb{E}_k$-monoidal structure on LMod_R induces an $\mathbb{E}_k$-monoidal structure on the subcategory $\mathrm{LMod}_R^{\heartsuit}$ of discrete objects of LMod_R, which is equivalent to the nerve of the ordinary category of discrete modules over $\pi_0 R$. This $\mathbb{E}_k$-monoidal structure is given by the usual tensor product of modules over the commutative ring $\pi_0 R$. This follows, for example, from Theorem 7.1.2.13. We will discuss this point at greater length in §7.2.1.

Definition 7.1.3.17. Let $0 \leq k \leq \infty$ and let R be a connective $\mathbb{E}_{k+1}$-ring. We say that an $\mathbb{E}_k$-algebra R is *discrete* if it is connective and 0-truncated. We let $\mathrm{Alg}_R^{(k),\mathrm{disc}}$ denote the full subcategory of $\mathrm{Alg}_R^{(k)}$ spanned by the discrete objects.

Since the mapping spaces in $\mathrm{Alg}_R^{(k),\mathrm{disc}}$ are 0-truncated, it follows that $\mathrm{Alg}_R^{(k),\mathrm{disc}}$ is equivalent to the nerve of an ordinary category. We next identify the relevant category.

Proposition 7.1.3.18. *Let $1 \leq k \leq \infty$, and let R be a connective $\mathbb{E}_{k+1}$-ring. If $k = 1$, then the construction $A \mapsto \pi_0 A$ induces an equivalence from $\mathrm{Alg}_R^{(k)}$ to the (nerve of the) ordinary category of discrete associative algebras over $\pi_0 R$. If $k \geq 2$, then the construction $A \mapsto \pi_0 A$ determines an equivalence from $\mathrm{Alg}_R^{(k)}$ to the (nerve of the) ordinary category of discrete commutative algebras over $\pi_0 R$.*

Proof. Using Proposition 7.1.3.15, we can identify $\mathrm{Alg}_R^{(k),\mathrm{disc}}$ with the ∞-category of $\mathbb{E}_k$-algebra objects of the heart $\mathrm{LMod}_R^{\heartsuit}$. Combining this with Remark 7.1.3.16, we see that $\mathrm{Alg}_R^{(1),\mathrm{disc}}$ can be identified with the nerve of the category of associative algebras over $\pi_0 R$. When $k \geq 2$, Remark 7.1.3.16 and Corollary 5.1.1.7 imply that $\mathrm{Alg}_{/\mathbb{E}_k}(\mathrm{LMod}_R^{\heartsuit})$ can be identified with the nerve of the ordinary category of *commutative* $\pi_0 R$-algebras. □

Let $0 \leq k \leq \infty$ and let R be a connective $\mathbb{E}_{k+1}$-ring. Since the t-structure on LMod_R is left complete (Proposition 7.1.1.13), the map

$$\mathrm{LMod}_R^{\mathrm{cn}} \to \varprojlim_n \mathrm{LMod}_R^{\mathrm{cn}} \cap (\mathrm{LMod}_R)_{\leq n}$$

is an equivalence of ∞-categories. The forgetful functor $\mathrm{Alg}_{/\mathbb{E}_k}(\widehat{\mathcal{C}\mathrm{at}}_\infty) \to \widehat{\mathcal{C}\mathrm{at}}_\infty$ preserves small limits (Corollary 3.2.2.5), so that $\mathrm{LMod}_R^{\mathrm{cn}}$ is also a limit of the sequence $\{\mathrm{LMod}_R^{\mathrm{cn}} \cap (\mathrm{LMod}_R)_{\leq n}\}$ in the ∞-category of $\mathbb{E}_k$-monoidal ∞-categories and therefore also in the ∞-category Op_∞ of ∞-operads. This immediately implies the following:

Proposition 7.1.3.19. *Let $0 \leq k \leq \infty$, and let R be a connective $\mathbb{E}_{k+1}$-ring. Then the canonical map*

$$\mathrm{Alg}_R^{(k),\mathrm{cn}} \to \varprojlim_n (\tau_{\leq n} \mathrm{Alg}_R^{(k),\mathrm{cn}})$$

is an equivalence of ∞-categories. In other words, Postnikov towers are convergent in the ∞-category $\mathrm{Alg}_R^{(k),\mathrm{cn}}$ of connective $\mathbb{E}_k$-algebras over R (see Definition HTT.5.5.6.23).

小红书号:3189205503 qq

7.1.4 Algebras over Commutative Rings

Let R be a commutative ring, which we regard as a discrete $\mathbb{E}_\infty$-ring. Our goal in this section is to describe some explicit models for the ∞-category of $\mathbb{E}_1$-algebras over R and (when R contains the field $\mathbf{Q}$ of rational numbers) the ∞-category of $\mathbb{E}_\infty$-algebras over R. We begin by reviewing a bit of terminology.

Definition 7.1.4.1. Let R be a commutative ring. A *differential graded algebra over* R is a graded associative algebra A_* over R equipped with a differential $d : A_* \to A_{*-1}$ satisfying the following conditions:

- The square of the differential d is equal to zero.
- The map d is a (graded) derivation. That is, we have the Leibniz rule $d(xy) = (dx)y + (-1)^m x dy$ for $x \in A_m$, $y \in A_n$.

If A_* and B_* are differential graded algebras over R, then a *morphism of differential graded algebras* from A_* to B_* is a homomorphism of graded R-algebras $\phi : A_* \to B_*$ such that $\phi(dx) = d\phi(x)$. With this notion of morphism, the collection of differential graded algebras over R forms a category, which we will denote by $\mathrm{Alg}^{\mathrm{dg}}_{(} R)$.

Remark 7.1.4.2. Let R be a commutative ring and let $\mathcal{A}$ be the abelian category of (discrete) R-modules. Then we can identify differential graded algebras over R with associative algebra objects in the category $\mathrm{Ch}(\mathcal{A})$ of chain complexes of R-modules. This identification gives an equivalence of categories $\mathrm{Alg}(\mathrm{Ch}(\mathcal{A})) \simeq \mathrm{Alg}^{\mathrm{dg}}_{(} R)$.

If we want to understand the structure of differential graded algebras over R, we should begin by studying the tensor product of chain complexes over R.

Proposition 7.1.4.3. *Let R be a commutative ring, let $\mathcal{A}$ be the category of R-modules, and regard $\mathrm{Ch}(\mathcal{A})$ as a symmetric monoidal model category with respect to the projective model structure of Proposition 7.1.2.8. Then $\mathrm{Ch}(\mathcal{A})$ satisfies the monoid axiom (see Definition 4.1.8.1).*

Proof. Let U be the collection of all morphisms in $\mathrm{Ch}(\mathcal{A})$ of the form $M_* \otimes N'_* \to M_* \otimes N_*$, where $N'_* \to N_*$ is a trivial cofibration. Let $\overline{U}$ be the weakly saturated class of morphisms generated by U. We wish to show that every morphism in $\overline{U}$ is a quasi-isomorphism. We will prove a stronger assertion: namely, every morphism in $\overline{U}$ is a trivial cofibration with respect to the model structure described in Proposition 1.3.5.3. For this, it suffices to show that every morphism in U is a trivial cofibration with respect to the model structure of Proposition 1.3.5.3.

Let M_* be an arbitrary object of $\mathrm{Ch}(\mathcal{A})$, and let $f : N'_{|ast} \to N_*$ be a trivial cofibration with respect to the projective model structure; we wish to show that the induced map $F : M_* \otimes N'_* \to$

小红书 小红书号:3189205503 qq

$M_* \otimes N_*$ is a trivial cofibration with respect to the model structure of Proposition 1.3.5.3. We have an exact sequence of chain complexes

$$0 \to N'_* \to N_* \to N''_* \to 0$$

where each of the maps

$$0 \to N'_i \to N_i \to N''_i \to 0$$

is split exact. It follows that the sequence of chain complexes

$$0 \to M_* \otimes N'_* \xrightarrow{F} M_* \otimes N_* \to M_* \otimes N''_* \to 0$$

is exact, so that F is a monomorphism. We must show that F is a quasi-isomorphism. Equivalently, we must show that the chain complex $M_* \otimes N''_*$ is acyclic. As in the proof of Proposition 7.1.2.8, we observe that the chain complex N''_* admits a contracting homotopy, so that $M_* \otimes N''_*$ also admits a contracting homotopy and is therefore acyclic. □

Remark 7.1.4.4. Let A_* be a differential graded algebra over a commutative ring R. Then we can regard A_* as a chain complex of R-modules. We will denote the homology of this chain complex by $\mathrm{H}_*(A)$. The multiplication on A_* induces a multiplication on $\mathrm{H}_*(A)$, so that $\mathrm{H}_*(R)$ has the structure of a graded R-algebra.

We say that a map $\phi : A_* \to B_*$ of differential graded algebras is a *quasi-isomorphism* if it induces a quasi-isomorphism of chain complexes over R: that is, if and only if it induces an isomorphism of graded rings $\mathrm{H}_*(A) \to \mathrm{H}_*(B)$.

Proposition 7.1.4.5. *Let R be a commutative ring. Then there exists a combinatorial model structure on the category $\mathrm{Alg}^{\mathrm{dg}}_{(} R)$ of differential graded algebras over R with the following properties:*

- *(W) A morphism of differential graded algebras $\phi : A_* \to B_*$ is a weak equivalence if and only if it is a quasi-isomorphism.*
- *(F) A morphism of differential graded algebras $\phi : A_* \to B_*$ is a fibration if and only if each of the maps $A_n \to B_n$ is surjective.*

Moreover, if R is a field, then the model category $\mathrm{Alg}^{\mathrm{dg}}_{(} R)$ is left proper.

Proof. Combine Proposition 4.1.8.3, Proposition 7.1.4.3, and Proposition 7.1.2.8. The last assertion follows from Proposition 4.1.8.3 and Remark 7.1.2.10. □

Proposition 7.1.4.6. *Let R be a commutative ring, let $\mathrm{Alg}^{\mathrm{dg}}_{(} R)$ denote the category of differential graded algebras over R, let $\mathrm{Alg}^{\mathrm{dg}}_{(} R)^c$ be the full subcategory of $\mathrm{Alg}^{\mathrm{dg}}_{(} R)$ spanned by the cofibrant*

小红书
小红书号:3189205503 qq

objects, and let W denote the collection of weak equivalences in $\mathrm{Alg}^{\mathrm{dg}}_{(}R)^c$. Then there is a canonical equivalence of ∞-categories

$$\mathrm{N}(\mathrm{Alg}^{\mathrm{dg}}_{(}R)^c)[W^{-1}] \simeq \mathrm{Alg}^{(1)}_R .$$

In other words, we can identify the ∞-category of $\mathbb{E}_1$-algebras over R with the underlying ∞-category of the model category $\mathrm{Alg}^{\mathrm{dg}}_{(}R)$ of differential graded R-algebras.

Proof. Combine Theorems 7.1.2.13 and 4.1.8.4. □

We next prove an analogue of Proposition 7.1.4.6 for $\mathbb{E}_\infty$-algebras, assuming that the commutative ring R has characteristic zero.

Proposition 7.1.4.7. *Let R be a commutative ring containing the field $\mathbf{Q}$ of rational numbers and let $\mathcal{A}$ be the abelian category of discrete R-modules. Regard $\mathrm{Ch}(\mathcal{A})$ as endowed with the projective model structure of Proposition 7.1.2.8. Then $\mathrm{Ch}(\mathcal{A})$ is freely powered (see Definition 4.5.4.2).*

Proof. We must show that if $f : M_* \to N_*$ is a cofibration in $\mathrm{Ch}(\mathcal{A})$, then f is a power cofibration. Without loss of generality, we may assume that f is a generating cofibration of the form $\partial E(m)_* \to E(m)_*$ for some $m \in \mathbf{Z}$ (see the proof of Proposition 7.1.2.8 for an explanation of this notation). We wish to show that for each $n \geq 0$, the induced map $\phi : \square^n(f) \to E(m)_*^{\otimes n}$ is a projective cofibration in $\mathrm{Ch}(\mathcal{A})^{\Sigma_n}$, where Σ_n denotes the symmetric group on n letters. Note that ϕ is a pushout of the inclusion $\phi_0 : \partial E(nm)_* \to E(nm)_*$, where the symmetric group acts trivially on $E(nm)_*$ if m is even and by the sign representation if m is odd. In either case, the assumption that R contains the field $\mathbf{Q}$ guarantees that ϕ_0 is a retract of the projective cofibration

$$\partial E(nm)_* \otimes_R R[\Sigma_n] \to E(nm)_* \otimes_R R[\Sigma_n],$$

where $R[\Sigma_n]$ denotes the regular representation of Σ_n over R. □

Definition 7.1.4.8. Let R be a commutative ring and let A_* be a differential graded algebra over R. We will say that A_* is a *commutative differential graded algebra* if for every pair of elements $x \in A_m$, $y \in A_n$, we have $xy = (-1)^{mn}yx$. We let $\mathrm{CAlg}^{\mathrm{dg}}_{(}R)$ denote the full subcategory of $\mathrm{Alg}^{\mathrm{dg}}_{(}R)$ spanned by the commutative differential graded algebras over R.

Remark 7.1.4.9. Let R be a commutative ring and let $\mathcal{A}$ be the abelian category of (discrete) R-modules. Then we can identify commutative differential graded algebras over R with commutative algebra objects in the category $\mathrm{Ch}(\mathcal{A})$ of chain complexes of R-modules. This identification gives an equivalence of categories $\mathrm{CAlg}(\mathrm{Ch}(\mathcal{A})) \simeq \mathrm{CAlg}^{\mathrm{dg}}_{(}R)$.

Combining Proposition 7.1.4.3, Proposition 7.1.4.7, and Proposition 4.5.4.6, we obtain the following:

小红书
小红书号:3189205503 qq

Proposition 7.1.4.10. *Let R be a commutative ring which contains the field $\mathbf{Q}$ of rational numbers. Then there exists a combinatorial model structure on the category $\mathrm{CAlg}^{\mathrm{dg}}_{(} R)$ of differential graded algebras over R with the following properties:*

(*W*) *A morphism of commutative differential graded algebras $\phi : A_* \to B_*$ is a weak equivalence if and only if it is a quasi-isomorphism.*

(*F*) *A morphism of commutative differential graded algebras $\phi : A_* \to B_*$ is a fibration if and only if each of the maps $A_n \to B_n$ is surjective.*

Using Theorems 7.1.2.13 and 4.5.4.7, we obtain:

Proposition 7.1.4.11. *Let R be a commutative ring and let $\mathrm{CAlg}^{\mathrm{dg}}_{(} R)$ denote the category of commutative differential graded algebras over R. Assume that R contains the field $\mathbf{Q}$ of rational numbers, let $\mathrm{CAlg}^{\mathrm{dg}}_{(} R)^c$ be the full subcategory of $\mathrm{CAlg}^{\mathrm{dg}}_{(} R)$ spanned by the cofibrant objects, and let W denote the collection of weak equivalences in $\mathrm{CAlg}^{\mathrm{dg}}_{(} R)^c$. Then there is a canonical equivalence of ∞-categories*

$$\mathrm{N}(\mathrm{CAlg}^{\mathrm{dg}}_{(} R)^c)[W^{-1}] \simeq \mathrm{CAlg}_R .$$

In other words, we can identify the ∞-category of $\mathbb{E}_\infty$-algebras over R with the underlying ∞-category of the model category $\mathrm{CAlg}^{\mathrm{dg}}_{(} R)$ of commutative differential graded R-algebras.

Propositions 7.1.4.6 and 7.1.4.11 provided concrete models for the ∞-categories of $\mathbb{E}_1$ and $\mathbb{E}_\infty$-algebras over discrete commutative rings. If we are willing to restrict our attention to *connective* algebras, then there is another concrete model available, provided by the theory of simplicial rings. We begin with a few preliminary remarks.

Let $\mathcal{C}$ be a presentable ∞-category. We recall that an object $C \in \mathcal{C}$ is said to be *compact and projective* if the corepresentable functor $\mathrm{Map}_{\mathcal{C}}(C, \bullet)$ preserves sifted colimits. We say that $\mathcal{C}$ is *projectively generated* if there exists a small collection of compact projective objects $\{C_\alpha\}$ of $\mathcal{C}$ which generates $\mathcal{C}$ under small colimits; see Definition HTT.5.5.8.23 . In this case, we will say that $\{C_\alpha\}$ is a *set of compact projective generators* for $\mathcal{C}$.

Proposition 7.1.4.12. *Let $G : \mathcal{C} \to \mathcal{D}$ be a functor between presentable ∞-categories. Assume that G preserves small limits, small sifted colimits, and is conservative. Then:*

(1) *The functor G admits a left adjoint F.*

(2) *The functor F carries compact projective objects of $\mathcal{D}$ to compact projective objects of $\mathcal{C}$.*

(3) *Let $\{D_\alpha\}$ be a set of compact projective generators for $\mathcal{D}$. Then $\{F(D_\alpha)\}$ is a set of compact projective generators for $\mathcal{C}$.*

(4) *If $\mathcal{D}$ is projectively generated, so is $\mathcal{C}$.*

小红书
小红书号:3189205503 qq

Proof. Assertion (1) follows from Corollary HTT.5.5.2.9 and assertion (2) from the assumption that G preserves sifted colimits. To prove (3), let $\mathcal{C}_0$ be the full subcategory of $\mathcal{C}$ generated under small colimits by the objects $\{F(D_\alpha)\}$. Then the inclusion $\mathcal{C}_0 \hookrightarrow \mathcal{C}$ admits a right adjoint U (by Corollary HTT.5.5.2.9). To prove that U is an equivalence, it suffices to show that for each $C \in \mathcal{C}$, the map $U(C) \to C$ is an equivalence. Since G is conservative, it suffices to show that $G(U(C)) \to G(C)$ is an equivalence in $\mathcal{D}$. Because the objects $\{D_\alpha\}$ generate $\mathcal{D}$ under small colimits, we are reduced to proving that the map

$$\mathrm{Map}_{\mathcal{D}}(D_\alpha, G(U(C))) \simeq \mathrm{Map}_{\mathcal{C}}(F(D_\alpha), U(C)) \to \mathrm{Map}_{\mathcal{C}}(F(D_\alpha), C) \simeq \mathrm{Map}_{\mathcal{D}}(D_\alpha, G(C))$$

is a homotopy equivalence, which is clear. Assertion (4) is an immediate consequence of (3). □

Corollary 7.1.4.13. *The ∞-category $\mathrm{Sp}^{\mathrm{cn}}$ of connective spectra is projectively generated: in fact, the sphere spectrum S is a compact projective generator for $\mathrm{Sp}^{\mathrm{cn}}$.*

Proof. Apply Proposition 7.1.4.12 to the 0th space functor $\Omega^\infty : \mathrm{Sp}_{\geq 0} \to \mathcal{S}$ and invoke Proposition 1.4.3.9. □

Corollary 7.1.4.14. *Let $\mathcal{M}$ be a presentable ∞-category which is left-tensored over a monoidal ∞-category $\mathcal{C}$, and let $R \in \mathrm{Alg}(\mathcal{C})$ be an algebra object such that tensor product with R induces a functor $\mathcal{M} \to \mathcal{M}$ which commutes with small colimits. If $\mathcal{M}$ is projectively generated, then $\mathrm{LMod}_R(\mathcal{M})$ is projectively generated. Moreover, if $\{M_\alpha\}$ is a collection of compact projective generators for $\mathcal{M}$, then the free modules $\{R \otimes M_\alpha\}$ are compact projective generators for the ∞-category $\mathrm{LMod}_R(\mathcal{M})$.*

Proof. Apply Proposition 7.1.4.12 to the forgetful functor $\mathrm{LMod}_R(\mathcal{M}) \to \mathcal{M}$ and use Corollary 4.2.3.7. □

Corollary 7.1.4.15. *Let R be a connective $\mathbb{E}_1$-ring. Then the ∞-category $\mathrm{LMod}_R^{\mathrm{cn}}$ is projectively generated; in fact, the object R (regarded as a left module over itself) is a compact projective generator for $\mathrm{LMod}_R^{\mathrm{cn}}$.*

Proof. Combine Corollaries 7.1.4.13 and 7.1.4.14. □

Corollary 7.1.4.16. *Let $\mathcal{O}^\otimes$ be an ∞-operad and let $p : \mathcal{C}^\otimes \to \mathcal{O}^\otimes$ be a coCartesian fibration of ∞-operads. Assume that p is compatible with small colimits and that for each object $X \in \mathcal{O}$, the fiber $\mathcal{C}_X$ is a projectively generated ∞-category. Then the ∞-category $\mathrm{Alg}_{/\mathcal{O}}(\mathcal{C})$ is projectively generated.*

For each $X \in \mathcal{O}$, let $\mathrm{Free}_X : \mathcal{C}_X \to \mathrm{Alg}_{/\mathcal{O}}(\mathcal{C})$ be a left adjoint to the evaluation functor, and let $\{C_{X,\alpha} \in \mathcal{C}_X\}$ is a collection of compact generators for the ∞-category $\mathcal{C}_X$. Then the collection of objects $\{\mathrm{Free}_X(C_{X,\alpha})\}$ (where X ranges over the objects of $\mathcal{O}$) is a collection of compact projective generators for the ∞-category $\mathrm{Alg}_{/\mathcal{O}}(\mathcal{C})$.

Proof. Apply Proposition 7.1.4.12 to the forgetful functor $\mathrm{Alg}_{/\mathcal{O}}(\mathcal{C}) \to \prod_{X \in \mathcal{O}} \mathcal{C}_X$. □

小红书号:3189205503 qq

Corollary 7.1.4.17. *Let R be a connective $\mathbb{E}_{k+1}$-ring for $0 \leq k \leq \infty$. Then the ∞-category $\mathrm{Alg}_R^{(k),\mathrm{cn}}$ of connective $\mathbb{E}_k$-algebras over R is projectively generated. Moreover, if $\mathrm{Free} : \mathrm{LMod}_R \to \mathrm{Alg}_R^{(k),\mathrm{cn}}$ denotes a left adjoint to the forgetful functor, then $\mathrm{Free}(R)$ is a compact projective generator for $\mathrm{Alg}_R^{(k),\mathrm{cn}}$.*

Proof. Combine Corollaries 7.1.4.16 and 7.1.4.17. □

Let R be a commutative ring and let $M \simeq R^m$ be a free R-module of finite rank m. For every $n \geq 0$, the tensor power $M^{\otimes n}$ can be identified with a free module of rank m^n: here the tensor power can be computed either in the ordinary category of R-modules, or in the ∞-category $\mathrm{Mod}_R(\mathrm{Sp})$ of R-module spectra. It follows that the tensor algebra

$$T(M) = \bigoplus_{n \geq 0} M^{\otimes n}$$

can be identified with the free $\mathbb{E}_1$-algebra over R generated by M (see Proposition 4.1.1.18).

Let $\mathbf{Alg}_R$ denote the category of associative R-algebras (that is, associative algebras in the abelian category of R-modules) and let $\mathbf{Alg}_R^0$ denote the full subcategory of $\mathbf{Alg}_R$ spanned by objects of the form $T(M)$, where M is a free R-module of finite rank. According to Proposition 7.1.3.18, we can identify $\mathrm{N}(\mathbf{Alg}_R)$ with the full subcategory $\mathrm{Alg}_R^{(1),\mathrm{disc}} \subseteq \mathrm{Alg}_R^{(1)}$. Under this equivalence, $\mathrm{N}(\mathbf{Alg}_R^0)$ can be identified with the full subcategory of $\mathrm{Alg}_R^{(1)}$ given by finite coproducts of $T(R)$, which is a compact projective generator for $\mathrm{Alg}_R^{(1),\mathrm{cn}}$ by Corollary 7.1.4.17. It follows from Proposition HTT.5.5.8.25 that the fully faithful embedding $\mathrm{N}(\mathbf{Alg}_R^0) \to \mathrm{Alg}_R^{(1),\mathrm{cn}}$ extends to an equivalence of ∞-categories $\mathcal{P}_\Sigma(\mathrm{N}(\mathbf{Alg}_R^0)) \simeq \mathrm{Alg}_R^{(1),\mathrm{cn}}$. In particular, the ∞-category $\mathrm{Alg}_R^{(1),\mathrm{disc}}$ of discrete objects of $\mathrm{Alg}_R^{(1),\mathrm{cn}}$ can be identified with the full subcategory of $\mathcal{P}_\Sigma(\mathrm{N}(\mathbf{Alg}_R^0))$ spanned by those functors $\mathrm{N}(\mathbf{Alg}_R^0)^{\mathrm{op}} \to \mathcal{S}$ which preserve finite products and take 0-truncated values. Passing to homotopy categories, we obtain an equivalence

$$\mathbf{Alg}_R \simeq \mathrm{hAlg}_R^{(1),\mathrm{disc}} \simeq \mathrm{Fun}'((\mathbf{Alg}_R^0)^{\mathrm{op}}, \mathcal{S}\mathrm{et}),$$

where $\mathrm{Fun}'((\mathbf{Alg}_R^0)^{\mathrm{op}}, \mathcal{S}\mathrm{et})$ denotes the full subcategory of $\mathrm{Fun}((\mathbf{Alg}_R^0)^{\mathrm{op}}, \mathcal{S}\mathrm{et})$ spanned by those functors which preserve finite products. Applying Propositions HTT.5.5.9.1 and HTT.5.5.9.2, we obtain the following analogue of Proposition 7.1.4.6:

Proposition 7.1.4.18. *Let R be a commutative ring, let $\mathbf{Alg}_R$ be the category of (discrete) associative R-algebras, and let $\mathbf{A}$ denote the category of simplicial objects of $\mathbf{Alg}_R$. Then $\mathbf{A}$ admits a simplicial model structure which may be described as follows:*

- *(W) A map of simplicial associative R-algebras $A_\bullet \to B_\bullet$ is a weak equivalence if and only if the underlying map of simplicial sets is a weak homotopy equivalence.*
- *(F) A map of simplicial associative R-algebras $A_\bullet \to B_\bullet$ is a fibration if and only if the underlying map of simplicial sets is a Kan fibration.*

小红书 小红书号:3189205503 qq

Moreover, the underlying ∞-category $\mathrm{N}(\mathbf{A}^o)$ is canonically equivalent to the ∞-category $\mathrm{Alg}_R^{(1),\mathrm{cn}}$ of connective $\mathbb{E}_1$-algebras over R.

Remark 7.1.4.19. Let A be a connective $\mathbb{E}_1$-algebra over a discrete commutative ring R. Proposition 7.1.4.18 allows us to identify A with a simplicial object $A_\bullet$ in the category of associative R-algebras. The geometric realization $|A_\bullet|$ is a topological associative R-algebra, which determines $A_\bullet$ (and therefore the original $\mathbb{E}_1$-algebra A) up to equivalence. In particular, we can think of connective $\mathbb{E}_1$-algebras over $\mathbf{Z}$ as topological associative rings.

Suppose now that R is a commutative ring which contains the field $\mathbf{Q}$ of rational numbers. Let $\mathcal{A}$ be the abelian category of R-modules and regard the category $\mathrm{CAlg}_{(}^{\mathrm{dg}} R)$ as endowed with the model structure described in Proposition 7.1.4.10. The forgetful functor $\mathrm{CAlg}_{(}^{\mathrm{dg}} R) \to \mathrm{Ch}(\mathcal{A})$ is a right Quillen functor, so its left adjoint $M_* \mapsto \mathrm{Sym}^*(M_*)$ is a left Quillen functor. If M is a free R-module, then M is a cofibrant object of $\mathrm{Ch}(\mathcal{A})$ (when regarded as a chain complex concentrated in degree zero). It follows that if $\mathrm{Free} : \mathrm{Mod}_R \to \mathrm{CAlg}_R$ denotes a left adjoint to the forgetful functor, then Free carries the object $M \in \mathrm{N}(\mathcal{A}) \simeq \mathrm{Mod}_R^{\heartsuit}$ to the discrete commutative algebra $\mathrm{Sym}^*(M)$, which is a polynomial algebra over R.

We can now repeat the reasoning which precedes the statement of Proposition 7.1.4.18. Let $\mathbf{CAlg}_R$ denote the category of (discrete) commutative R-algebras and let Poly_R denote the full subcategory of $\mathbf{CAlg}_R$ spanned by objects of the form $R[x_1, \ldots, x_n] \simeq \mathrm{Sym}^*(R^n)$. According to Proposition 7.1.3.18, we can identify $\mathrm{N}(\mathbf{CAlg}_R)$ with the full subcategory $\mathrm{CAlg}_R^{\mathrm{disc}} \subseteq \mathrm{CAlg}_R^{(1)}$. Under this equivalence, $\mathrm{N}(\mathrm{Poly}_R)$ can be identified with the full subcategory of CAlg_R given by finite coproducts of $R[x] \simeq \mathrm{Free}(R)$, which is a compact projective generator for $\mathrm{CAlg}_R^{\mathrm{cn}}$ by Corollary 7.1.4.17. It follows from Proposition HTT.5.5.8.25 that the fully faithful embedding $\mathrm{N}(\mathrm{Poly}_R) \to \mathrm{CAlg}_R^{\mathrm{cn}}$ extends to an equivalence of ∞-categories $\mathcal{P}_\Sigma(\mathrm{N}(\mathrm{Poly}_R)) \simeq \mathrm{CAlg}_R^{\mathrm{cn}}$. In particular, the ∞-category $\mathrm{CAlg}_R^{\mathrm{disc}}$ of discrete objects of $\mathrm{CAlg}_R^{\mathrm{cn}}$ can be identified with the full subcategory of $\mathcal{P}_\Sigma(\mathrm{N}(\mathrm{Poly}_R))$ spanned by those functors $\mathrm{N}(\mathrm{Poly}_R)^{\mathrm{op}} \to \mathcal{S}$ which preserve finite products and take 0-truncated values. Passing to homotopy categories, we obtain an equivalence

$$\mathbf{CAlg}_R \simeq \mathrm{hCAlg}_R^{\mathrm{disc}} \simeq \mathrm{Fun}'((\mathbf{CAlg}_R^{0})^{\mathrm{op}}, \mathcal{S}\mathrm{et}),$$

where $\mathrm{Fun}'((\mathrm{Poly}_R)^{\mathrm{op}}, \mathcal{S}\mathrm{et})$ denotes the full subcategory of $\mathrm{Fun}((\mathrm{Poly}_R)^{\mathrm{op}}, \mathcal{S}\mathrm{et})$ spanned by those functors which preserve finite products. Using Propositions HTT.5.5.9.1 and HTT.5.5.9.2, we obtain a commutative analogue of Proposition 7.1.4.18:

Proposition 7.1.4.20. *Let R be a commutative ring which contains the field $\mathbf{Q}$ of rational numbers, let $\mathbf{CAlg}_R$ be the category of (discrete) commutative R-algebras, and let $\mathbf{A}$ denote the category of simplicial objects of $\mathbf{CAlg}_R$. Then $\mathbf{A}$ admits a simplicial model structure which may be described as follows:*

(*W*) *A map of simplicial commutative R-algebras $A_\bullet \to B_\bullet$ is a weak equivalence if and only if the underlying map of simplicial sets is a weak homotopy equivalence.*

小红书
小红书号:3189205503 qq

(F) *A map of simplicial commutative R-algebras $A_\bullet \to B_\bullet$ is a fibration if and only if the underlying map of simplicial sets is a Kan fibration.*

Moreover, the underlying ∞-category $\mathrm{N}(\mathbf{A}^o)$ is canonically equivalent to the ∞-category $\mathrm{CAlg}_R^{\mathrm{cn}}$ of connective $\mathbb{E}_\infty$-algebras over R.

Warning 7.1.4.21. For any commutative ring R, the category $\mathbf{A}$ of simplicial commutative R-algebras can be endowed with a model structure, with weak equivalences and fibrations as described in Proposition 7.1.4.20. Moreover, Proposition HTT.5.5.9.2 gives an equivalence $\mathrm{N}(\mathbf{A}^{\circ}) \simeq \mathcal{P}_\Sigma(\mathrm{N}(\mathrm{Poly}_R))$, so that the fully faithful embedding $\mathrm{N}(\mathrm{Poly}_R) \to \mathrm{CAlg}_R^{\mathrm{disc}} \subseteq \mathrm{CAlg}_R$ extends in an essentially unique way to a functor $\mathrm{N}(\mathbf{A}^{\circ}) \to \mathrm{CAlg}_R$ which preserves sifted colimits. However, this functor is generally not an equivalence unless R contains the field $\mathbf{Q}$ of rational numbers.

7.2 Properties of Rings and Modules

In §7.1, we introduced the theory of structured ring spectra and their modules. Our approach was rather abstract: the basic definitions were obtained by specializing the theory of algebras and modules over ∞-operads (developed in the earlier chapters of this book) to the case where the ambient symmetric monoidal ∞-category is the ∞-category of spectra. In this section, we consider some less formal aspects of the theory. In particular, we will show that several basic tools of noncommutative and homological algebra can be can be generalized to the setting of structured ring spectra.

We will begin by considering the relative tensor product construction introduced in §4.4.2. If R is an $\mathbb{E}_1$-ring, M a right R-module, and N a left R-module, then we can consider the tensor product spectrum $M \otimes_R N$. In §7.2.1, we address the question of computing the homotopy groups of $\pi_*(M \otimes_R N)$. Our main result (Proposition 7.2.1.19) asserts that $\pi_*(M \otimes_R N)$ can be computed by means of a spectral sequence, whose second page can be described in terms of the graded Tor-groups $\mathrm{Tor}_*^{\pi_* R}(\pi_* M, \pi_* N)$. Many questions about the theory of structured ring spectra can be reduced to an analysis of appropriate tensor products, for which this spectral sequence is an invaluable tool.

In §7.2.2, we define *flat* and *projective* modules over a connective $\mathbb{E}_1$-ring R. These definitions specialize to give the usual theory of flat and projective modules in the special case where R is discrete. Most of the familiar properties of flat and projective modules can be generalized to the nondiscrete case. For example, we prove a generalization of Lazard's theorem, which asserts that every flat R-module can be obtained as a filtered colimit of (finitely generated) projective R-modules (Theorem 7.2.2.15).

One of the most important constructions in commutative algebra is the formation of *localizations*: if R is a commutative ring, then we can associate to every multiplicatively closed subset $S \subseteq R$ a ring of fractions $R[S^{-1}]$ obtained by formally inverting the elements of S. In §7.2.3 we will review the theory of *Ore localization*, which extends this construction to noncommutative rings. We will then generalize the theory of Ore localization to the setting of $\mathbb{E}_1$-rings (and their modules).

小红书
小红书号:3189205503 qq

For every $\mathbb{E}_1$-ring R, the ∞-category LMod_R is compactly generated. We will refer to the compact objects of LMod_R as *perfect R-modules*. There is a closely related notion of *almost perfect* R-module, which we will introduce in §7.2.4. We also introduce the definition of a *(left) Noetherian* $\mathbb{E}_1$-ring R, generalizing the classical theory of Noetherian rings. As in the classical case, the assumption that R is (left) Noetherian ensures that finiteness conditions on (left) R-modules behave well. Moreover, if we restrict our attention to $\mathbb{E}_\infty$-rings, then the condition of being Noetherian is robust: for example, we have an analogue of the Hilbert basis theorem (Proposition 7.2.4.31).

7.2.1 Free Resolutions and Spectral Sequences

Let R be an $\mathbb{E}_1$-ring. In §7.1.1, we introduced the notion of left and right modules over R. If M is a right R-module and N is a left R-module, then we let $M \otimes_R N$ denote the relative tensor product of M and N (in the ∞-category of spectra). Our goal in this section is to develop some techniques which, in favorable cases, allow us to compute the homotopy groups of the tensor product $M \otimes_R N$ in terms of classical homological algebra.

We begin by recalling a few definitions. Let R be an associative ring and let N be a (discrete) left module over R. A *free resolution* of N is an exact sequence of left R-modules

$$\cdots \to P_2 \to P_1 \to P_0 \to N \to 0,$$

where each P_i is a free left module over R. If M is a right R-module, we obtain a chain complex of abelian groups

$$\cdots \to M \otimes_R P_2 \to M \otimes_R P_1 \to M \otimes_R P_0.$$

We denote the homology groups of this chain complex by $\mathrm{Tor}_i^R(M, N)$. In particular, the usual tensor product $M \otimes_R N$ can be identified with $\mathrm{Tor}_0^R(M, N)$.

The Tor groups $\mathrm{Tor}_i^R(M, N)$ are independent of the choice of free resolution P_* for the module N, up to canonical isomorphism, and depend functorially on the pair (M, N). To prove this, one can argue as follows: given any two projective resolutions P_* and Q_* of N, there exists a map of chain complexes of left R-modules

$$\begin{array}{ccccccccc} \cdots & \longrightarrow & P_2 & \longrightarrow & P_1 & \longrightarrow & P_0 & \longrightarrow & N \\ & & \downarrow{\scriptstyle f_2} & & \downarrow{\scriptstyle f_1} & & \downarrow{\scriptstyle f_0} & & \downarrow{\scriptstyle \mathrm{id}} \\ \cdots & \longrightarrow & Q_2 & \longrightarrow & Q_1 & \longrightarrow & Q_0 & \longrightarrow & N, \end{array}$$

which is unique up to chain homotopy. Consequently, one obtains a map of chain complexes of abelian groups

$$\begin{array}{ccccccc} \cdots & \longrightarrow & M \otimes_R P_2 & \longrightarrow & M \otimes_R P_1 & \longrightarrow & M \otimes_R P_0 \\ & & \downarrow & & \downarrow & & \downarrow \\ \cdots & \longrightarrow & M \otimes_R Q_2 & \longrightarrow & M \otimes_R Q_1 & \longrightarrow & M \otimes_R Q_0. \end{array}$$

小红书
小红书号:3189205503 qq

whose induced map on homology groups does not depend on the choice of f_*.

We would like to generalize some of the above ideas to the setting of ∞-categories. First, we need to recall a bit of terminology.

Notation 7.2.1.1. Let $\mathcal{C}$ be a presentable ∞-category, and let $X_\bullet$ be a simplicial object of $\mathcal{C}$. For each $n \geq 0$, we let $L_n(X)$ and $M_n(X)$ denote the nth latching and matching object of X, respectively (see §HTT.A.2.9).

Definition 7.2.1.2. Let $\mathcal{C}$ be a presentable ∞-category and let S be a collection of objects of $\mathcal{C}$. We will say that a simplicial object $X_\bullet$ of $\mathcal{C}$ is *S-free* if, for every integer n, there exists a map $F \to X_n$ in $\mathcal{C}$ which induces an equivalence $L_n(X) \coprod F \to X_n$, such that F is a coproduct of objects of S.

Let $C \in \mathcal{C}$ and let $X_\bullet$ be a simplicial object of $\mathcal{C}_{/C}$. We will say that $X_\bullet$ is an *S-hypercovering of C* if, for every object $Y \in S$ corepresenting a functor $\chi : \mathcal{C} \to \mathcal{S}$, the simplicial object $\chi(X_\bullet)$ is a hypercovering in the ∞-topos $\mathcal{S}_{/\chi(C)}$ (see Definition HTT.6.5.3.2).

Example 7.2.1.3. Let $\mathcal{A}$ be the category of left R-modules, for some associative ring R, and let $S = \{R\}$. Using Theorem 1.2.3.7, we can identify simplicial objects of $\mathrm{N}(\mathcal{A})$ with nonnegatively graded chain complexes of R-modules. Let $M_\bullet$ be a simplicial object of $\mathrm{N}(\mathcal{A})$ and let $P_* = N_*(M)$ be the corresponding chain complex. Then $M_\bullet$ is S-free if and only if each P_n is a free left R-module. A map $|M_\bullet| \to M$ exhibits $M_\bullet$ as an S-hypercovering of a left R-module M if and only if the associated chain complex

$$\cdots \to P_2 \to P_1 \to P_0 \to M \to 0$$

is exact.

Our first goal in this section is to establish some basic existence and uniqueness theorems for free resolutions. For existence, we have the following:

Proposition 7.2.1.4. *Let $\mathcal{C}$ be a presentable ∞-category and let S be a set of objects of $\mathcal{C}$. Then, for every object $C \in \mathcal{C}$, there exists an S-hypercovering $X_\bullet : \mathrm{N}(\mathbf{\Delta})^{\mathrm{op}} \to \mathcal{C}_{/C}$ whose image in $\mathcal{C}$ is S-free.*

Proof. We will construct a compatible sequence of functors $F^{\leq n} : \mathrm{N}(\mathbf{\Delta}_{+,\leq n})^{\mathrm{op}} \to \mathcal{C}$ satisfying the following conditions:

(*a*) For each $n \geq 0$, there exists an object $Z \in \mathcal{C}$ which is a coproduct of objects belonging to S and a map $Z \to F^{\leq n}([n])$ which induces an equivalence $Z \coprod L_n(F^{\leq n-1}) \to F^{\leq n}([n])$; here $L_n(F^{\leq n-1})$ denotes the nth latching object defined in §HTT.A.2.9 .

(*b*) For $n \geq 0$ and each $Y \in \mathcal{C}$, the map $\mathrm{Map}_{\mathcal{C}}(Y, F^{\leq n}([n])) \to \mathrm{Map}_{\mathcal{C}}(Y, M_n(F^{\leq n-1}))$ is surjective on connected components; here $M_n(F^{\leq n-1})$ denotes the nth matching object as defined in §HTT.A.2.9 .

小红书
小红书号:3189205503 qq

(c) We have $F^{\leq -1}([-1]) = C$.

Assuming that such a sequence can be constructed, the union $\bigcup_n F^{\leq n}$ defines a simplicial object of $\mathcal{C}_{/C}$ having the desired properties. The construction of the diagrams $F^{\leq n}$ proceeds by induction on n. If $n = -1$, then $F^{\leq n}$ is uniquely determined by condition (c). Otherwise, extending $F^{\leq n-1}$ to a diagram $F^{\leq n}$ is equivalent to factoring the canonical map $\alpha : L_n(F^{\leq n-1}) \to M_n(F^{\leq n-1})$ as a composition

$$L_n(F^{\leq n-1}) \xrightarrow{\alpha'} F^{\leq n}([n]) \xrightarrow{\alpha''} M_n(F^{\leq n-1})$$

(see Proposition HTT.A.2.9.14). To satisfy condition (a) we must have $F^{\leq n}([n]) \simeq L_n(X_\bullet^{\leq n-1}) \coprod Z$ for some $Z \in \mathcal{C}$ which is a coproduct of objects of S. Let $M = M_n(F^{\leq n-1})$. To supply a morphism α'' which satisfies (b), it suffices to give a map $\eta : Z \to M$ such that the induced map $\mathrm{Map}_{\mathcal{C}}(Y, Z) \to \mathrm{Map}_{\mathcal{C}}(Y, M)$ is surjective on connected components for each $Y \in S$. For this, we take Z to be the coproduct $\coprod_\alpha Y_\alpha$, where α ranges over all equivalence classes of pairs (Y_α, u_α) such that $Y_\alpha \in S$ and $u_\alpha : Y_\alpha \to M$ is a morphism in $\mathcal{C}$. □

We next address the uniqueness properties of S-free resolutions.

Proposition 7.2.1.5. *Let $\mathcal{C}$ be a presentable ∞-category and let S be a set of objects of $\mathcal{C}$. Let C be an object $\mathcal{C}$, let $Y_\bullet$ be an S-hypercovering of C, and let $X_\bullet$ be a simplicial object of $\mathcal{C}_{/C}$ whose image in $\mathcal{C}$ is S-free. Then there exists a map $f : X_\bullet \to Y_\bullet$ of simplicial objects in $\mathcal{C}_{/C}$.*

Proof. We construct f as the amalgam of a compatible sequence of maps $f^{\leq n} : X_\bullet|\,\mathrm{N}(\mathbf{\Delta}_{\leq n}) \to Y_\bullet|\,\mathrm{N}(\mathbf{\Delta}_{\leq n})$. Assume that $f^{\leq n-1}$ has already been constructed. Using Proposition HTT.A.2.9.14 , we are reduced to the problem of solving the lifting problem

$$\begin{array}{ccc} L_n(X) & \longrightarrow & Y_n \\ \downarrow & & \downarrow \\ X_n & \longrightarrow & M_n(Y) \end{array}$$

in $\mathcal{C}_{/C}$. Since $X_\bullet$ is S-free, we can write X_n as a coproduct $L_n(X) \coprod F$, where F is a coproduct of objects of S. It then suffices to show that every map $F \to M_n(Y)$ can be lifted to a map $F \to Y_n$, which follows immediately from our assumption that $Y_\bullet$ is an S-hypercovering of C. □

In the situation of Proposition 7.2.1.5, the map f is generally not unique. However, one can show that f is unique up to homotopy, in the following precise sense:

Definition 7.2.1.6. Let $\mathcal{C}$ be an ∞-category and let $X_\bullet, Y_\bullet : \mathrm{N}(\mathbf{\Delta})^{\mathrm{op}} \to \mathcal{C}$ be simplicial objects. Let $\delta^* : \mathrm{Fun}(\mathrm{N}(\mathbf{\Delta})^{\mathrm{op}}, \mathcal{C}) \to \mathrm{Fun}(\mathrm{N}(\mathbf{\Delta}_{/[1]})^{\mathrm{op}}, \mathcal{C})$ be the functor given by composition with the forgetful functor $\mathbf{\Delta}_{/[1]} \to \mathbf{\Delta}$. A *simplicial homotopy* from $X_\bullet$ to $Y_\bullet$ is a morphism $h : \delta^*(X_\bullet) \to \delta^*(Y_\bullet)$.

The inclusion maps $\{0\} \hookrightarrow [1] \hookleftarrow \{1\}$ induce forgetful functors

$$i_0^*, i_1^* : \mathrm{Fun}(\mathrm{N}(\mathbf{\Delta}_{/[1]})^{\mathrm{op}}, \mathcal{C}) \to \mathrm{Fun}(\mathrm{N}(\mathbf{\Delta})^{\mathrm{op}}, \mathcal{C}).$$

小红书 小红书号:3189205503 qq

Consequently, a simplicial homotopy h from $X_\bullet$ to $Y_\bullet$ determines maps of simplicial objects

$$f = i_0^*(h) : X_\bullet \to Y_\bullet \qquad g = i_1^*(h) : X_\bullet \to Y_\bullet.$$

In this case, we will say that h is a *simplicial homotopy from f to g*. We will say that f and g are *simplicially homotopic* if there is a simplicial homotopy from f to g.

Warning 7.2.1.7. The relation of simplicial homotopy introduced in Definition 7.2.1.6 is neither symmetric nor transitive in general.

Proposition 7.2.1.8. *Let $\mathcal{C}$ be a presentable ∞-category containing an object C, and let S be a set of objects of $\mathcal{C}$. Let $X_\bullet$ be a simplicial object of $\mathcal{C}_{/C}$ which is S-free and $Y_\bullet$ an S-hypercovering of C, and suppose we are given a pair of maps $f, g : X_\bullet \to Y_\bullet$ between simplicial objects of $\mathcal{C}_{/C}$. Then there is a simplicial homotopy from f to g.*

Proof. We employ the notation of Definition 7.2.1.6. Let K^0 be the full subcategory of $\mathrm{N}(\mathbf{\Delta}_{/[1]})^{\mathrm{op}}$ spanned by the constant maps $\sigma : [n] \to [1]$ and let $p_0 : K^0 \to \mathrm{N}(\mathbf{\Delta})^{\mathrm{op}}$ be the projection map, so that f and g determine a natural transformation $h^0 : p_0 \circ X_\bullet \to p_0 \circ Y_\bullet$. We wish to show that h^0 can be extended to a natural transformation $\delta^*(X_\bullet) \to \delta^*(Y_\bullet)$. Let $\{\sigma_i : [n_i] \to [1]\}_{i \geq 0}$ be an enumeration of the objects of $\mathbf{\Delta}_{/[1]}$ which do not belong to K^0, having the property that $n_i < n_j$ implies $i < j$. For $j \geq 1$, let K^j denote the full subcategory of $\mathrm{N}(\mathbf{\Delta}_{[1]})^{\mathrm{op}}$ spanned by the objects of K^0 together with the objects $\{\sigma_i\}_{i<j}$, and let $p_j : K^j \to \mathrm{N}(\mathbf{\Delta})^{\mathrm{op}}$ be the projection map. We will show that h^0 can be extended to a compatible family of natural transformations $h^j : p_j \circ X_\bullet \to p_j \circ Y_\bullet$. The construction proceeds by induction on j. Assume that h^j has already been constructed; we wish to show that h^j can be extended to a natural transformation $h^{j+1} : p_{j+1} \circ X_\bullet \to p_{j+1} \circ Y_\bullet$. The collection of injective and surjective maps endow $(\mathbf{\Delta}_{/[1]})^{\mathrm{op}}$ with the structure of a Reedy category. Using Proposition HTT.A.2.9.14 , we are reduced to solving a lifting problem of the form

$$\begin{array}{ccc} L_{n_j}(X) & \longrightarrow & Y_{n_j} \\ \downarrow & & \downarrow \\ X_{n_j} & \longrightarrow & M_{n_j}(Y) \end{array}$$

in the ∞-category $\mathcal{C}_{/C}$. Since $X_\bullet$ is S-free, we can write $X_{n_j} \simeq L_{n_j}(X) \coprod F$ where $F \in \mathcal{C}_{/C}$ is a coproduct of objects belonging to S. It therefore suffices to show that every map $F \to M_{n_j}(Y)$ can be lifted to a map $F \to Y_{n_j}$, which follows from our assumption that Y is an S-hypercovering. $\square$

Remark 7.2.1.9. In the situation of Proposition 7.2.1.8, the simplicial homotopy h between f and g is not unique. It is possible to address this issue by introducing a notion of higher (simplicial) homotopy. The proof of Proposition 7.2.1.8 then adapts to show that h is unique up to higher homotopy, which is itself unique up to a higher homotopy, and so forth. Since these results will not be needed in what follows, we leave them to the reader's imagination.

小红书
小红书号:3189205503 qq

Remark 7.2.1.10. Let $\mathcal{A}$ be an abelian category and let $A_\bullet$ and $B_\bullet$ be simplicial objects of $\mathcal{A}$. Suppose we are given maps of simplicial objects $f, g : A_\bullet \to B_\bullet$ which are simplicially homotopic. Then the induced maps of unnormalized chain complexes $C_*(A) \to C_*(B)$ are chain homotopic: that is, there exists maps $h_n : N_n(A) \to N_{n+1}(B)$ such that $d \circ h_n + h_{n-1} \circ d = f - g$, where we adopt the convention that $h_{-1} = 0$. It follows that f and g induce the same map on homology objects $\mathrm{H}_*(A) \to \mathrm{H}_*(B)$.

To prove this, suppose that H is a simplicial homotopy from f to g. We then define h_n to be the sum of the maps

$$A_n \xrightarrow{s_i} A_{n+1} \xrightarrow{H(\sigma_i)} B_{n+1},$$

where s_i denotes the ith degeneracy map (induced by the unique surjection $a : [n+1] \to [n]$ satisfying $a(i) = a(i+1)$) and $\sigma_i \in \mathbf{\Delta}_{/[1]}$ denotes the map given by $\sigma_i(j) = \begin{cases} 0 & \text{if } j \leq i \\ 1 & \text{if } j > i. \end{cases}$

We now have the following general observation:

Proposition 7.2.1.11. *Let $\mathcal{C}$ be a presentable ∞-category containing a set of objects S and let $\mathcal{A}$ be an ordinary category. Let $\mathcal{C}'$ denote the full subcategory of $\mathrm{Fun}(\mathrm{N}(\mathbf{\Delta})^{\mathrm{op}}, \mathcal{C})$ spanned by the S-free simplicial objects and let $U : \mathcal{C}' \to \mathcal{C}$ be the geometric realization functor. Suppose we are given a functor $F_0 : \mathrm{h}\mathcal{C}' \to \mathcal{A}$ with the following property:*

($*$) *Let $f, g : X_\bullet \to Y_\bullet$ be simplicially homotopic morphisms in $\mathcal{C}'$. Then $F_0(f) = F_0(g)$.*

Then there exists a functor $F : \mathrm{h}\mathcal{C} \to \mathcal{A}$ together with a natural transformation $\alpha : F_0 \to F \circ U$ having the following property: whenever $X_\bullet$ is an S-free S-hypercovering of an object $C \in \mathcal{C}$, the induced map $F_0(X_\bullet) \xrightarrow{\alpha} F(|X_\bullet|) \to F(C)$ is an isomorphism in $\mathcal{A}$. Moreover, the functor F (and natural transformation α) are unique up to (unique) isomorphism.

Proof. We can characterize the functor F abstractly as a left Kan extension of F_0 along the functor U. However, it is easy enough to give a concrete construction of F:

(a) For every object $C \in \mathcal{C}$, we can choose an S-free S-hypercovering $X_\bullet$ of C (Proposition 7.2.1.4). We then define $F(C)$ to be $F_0(X_\bullet) \in \mathcal{A}$.

(b) Let $u : C \to C'$ be a morphism in $\mathcal{C}$, and let $X_\bullet$ and $Y_\bullet$ be the S-free S-hypercoverings of C and C' chosen in (a). It follows from Proposition 7.2.1.5 that u can be lifted to a map of simplicial objects $\overline{u} : X_\bullet \to Y_\bullet$. We define $F(u) : F(C) \to F(C')$ to be the map $F_0(\overline{u}) : F_0(X_\bullet) \to F_0(Y_\bullet)$. It follows from Proposition 7.2.1.8 and assumption ($*$) that $F(u)$ does not depend on the choice of $\overline{u}$.

This construction determines a functor $F : \mathrm{h}\mathcal{C} \to \mathcal{A}$. For each object $Y_\bullet \in \mathcal{C}'$, let $C = |Y_\bullet|$ and let $X_\bullet$ be the S-free S-hypercovering of C chosen in (a). Using Proposition 7.2.1.5, we can choose a

小红书
小红书号:3189205503 qq

map of simplicial objects $v : Y_\bullet \to X_\bullet$ in $\mathcal{C}_{/C}$. Let $\alpha(Y_\bullet) = F_0(v) : F_0(Y_\bullet) \to F_0(X_\bullet) = F(C)$. It follows from Proposition 7.2.1.8 and assumption $(*)$ that the map $\alpha(C)$ does not depend on v, so that α determines a natural transformation of functors $F_0 \to F \circ U$.

We next claim that if $X_\bullet$ is an S-hypercovering of an object C, then the composite map $F_0(X_\bullet) \overset{\alpha(X_\bullet)}{\to} F(|X_\bullet|) \to F(C)$ is an isomorphism in $\mathcal{A}$. To prove this, let $Y_\bullet$ and $Z_\bullet$ denote the S-free S-hypercoverings of $|X_\bullet|$ and C chosen in (a). Choose a map of simplicial objects $u : X_\bullet \to Y_\bullet$ in $\mathcal{C}_{/|X_\bullet|}$ and a map of simplicial objects $v : Y_\bullet \to Z_\bullet$ in $\mathcal{C}_{/C}$; we wish to show that $F_0(v \circ u)$ is an isomorphism. To prove this, we use Proposition 7.2.1.5 to choose a map of simplicial objects $w : Z_\bullet \to X_\bullet$ in $\mathcal{C}_{/C}$. Then $w \circ (v \circ u)$ and $(v \circ u) \circ w$ are simplicially homotopic to the identity maps on $Z_\bullet$ and $X_\bullet$, respectively (Proposition 7.2.1.8). Using $(*)$, we conclude that $F_0(w)$ is both right and left inverse to $F_0(v \circ u)$, so that $F_0(v \circ u)$ is an isomorphism. This completes the construction of F and α.

Now suppose that $F' : \mathrm{h}\mathcal{C} \to \mathcal{A}$ is any other functor equipped with a natural transformation $\alpha' : F_0 \to F' \circ U$. There is a unique natural transformation $\beta : F \to F'$ such that the diagram

$$\begin{array}{ccc} & F_0 & \\ {\scriptstyle \alpha}\swarrow & & \searrow{\scriptstyle \alpha'} \\ F \circ U & \xrightarrow{\beta'} & F' \circ U \end{array}$$

is commutative. The natural transformation β can be described explicitly as follows: if $C \in \mathcal{C}$ is an object and $X_\bullet$ be the S-free S-hypercovering of C chosen in (a), then β is the composite map

$$F(C) = F_0(X_\bullet) \to F'(|X_\bullet|) \to F'(C).$$

To complete the proof, it suffices to observe that if α' has the property that the composite map $F_0(X_\bullet) \to F'(C)$ is an isomorphism whenever $X_\bullet$ is an S-hypercovering of C, then the natural transformation β is an isomorphism. □

Example 7.2.1.12. Let R be an associative ring, let $\mathcal{C}$ be the category of left R-modules, and let $\mathcal{A}$ be any abelian category.

Let $\mathcal{C}'$ denote the subcategory of $\mathrm{Ch}(\mathcal{C})$ consisting of nonnegatively graded chain complexes of free left R-modules, and suppose we are given an additive functor F from the category of free R-modules into $\mathcal{A}$. Applying F termwise, we obtain a chain-complex valued functor $\mathcal{C}' \to \mathrm{Ch}(\mathcal{A})$ which we will also denote by F. For every integer n, the composite functor

$$\mathcal{C}' \xrightarrow{F} \mathrm{Ch}(\mathcal{A}) \xrightarrow{\mathrm{H}_n} \mathcal{A}$$

can be regarded as an $\mathcal{A}$-valued functor on simplicial objects in the category of free left R-modules. Remark 7.2.1.10 implies that this functor satisfies hypothesis $(*)$ of Proposition 7.2.1.11, and therefore induces a functor $L_nF : \mathcal{C} \to \mathcal{A}$. We refer to L_nF as the *nth left derived functor of* F.

小红书
小红书号:3189205503 qq

Concretely, if N is a left R-module having a free resolution

$$\cdots \to P_2 \to P_1 \to P_0 \to N,$$

then $L_n F(N)$ can be identified with the nth homology object of the chain complex

$$\cdots \to F(P_2) \to F(P_1) \to F(P_0).$$

Remark 7.2.1.13. In the special case where F is right exact and $\mathcal{A}$ has enough projective objects, the functors $L_n F$ are given by the composition

$$\mathrm{N}(\mathcal{C}) \longrightarrow \mathcal{D}^-(\mathcal{C}) \xrightarrow{LF} \mathcal{D}^-(\mathcal{A}) \xrightarrow{\pi_n} \mathrm{N}(\mathcal{A}),$$

where $LF : \mathcal{D}^-(\mathcal{C}) \to \mathcal{D}^-(\mathcal{A})$ is the left derived functor of F described in Example 1.3.3.4.

Example 7.2.1.14. Let R be an associative ring and let M be a right R-module. Then the usual tensor product construction $N \mapsto M \otimes_R N$ determines a functor from the category $\mathcal{C}$ of left R-modules to the category $\mathcal{A}b$ of abelian groups. The left derived functors of this construction are denoted by $\mathrm{Tor}^R_n(M, \bullet) : \mathcal{C} \to \mathcal{A}b$.

Variant 7.2.1.15. Let R be a graded associative ring and let $\mathcal{C}$ be the abelian category of graded left R-modules. For every integer n, let $R[n] \in \mathcal{C}$ denote the ring R itself, equipped with the shifted grading given by $R[n]_m \simeq R_{m-n}$. We say that a graded left R-module N is *graded-free* if it is isomorphic to a direct sum $\bigoplus_{\alpha \in A} R[n_\alpha]$ for some collection of integers $\{n_\alpha\}_{\alpha \in A}$. Let $\mathcal{C}_0$ be the full subcategory of $\mathcal{C}$ spanned by the graded-free R-modules.

Let $\mathbf{GrAb}$ denote the category of graded abelian groups. If M is a graded right R-module and N is a graded left R-module, then the algebraic tensor product $M \otimes_R N$ inherits a grading; we may therefore view the construction $N \mapsto M \otimes_R N$ as a functor from the category $\mathcal{C}$ to the category of graded abelian groups. Arguing as in Example 7.2.1.12, we can use Proposition 7.2.1.11 to define left derived functors

$$\mathrm{Tor}^R_n(M, \bullet) : \mathcal{C} \to \mathbf{GrAb}\,.$$

Concretely, the graded abelian group $\mathrm{Tor}^R_n(M, N)$ is given by nth homology of the chain complex

$$\cdots \to M \otimes_R P_2 \to M \otimes_R P_1 \to M \otimes_R P_0,$$

where P_* denotes a resolution of N by graded-free objects of $\mathcal{C}$.

Our next goal is to apply the formalism developed above to study the tensor product of modules over a ring spectrum. Let R be an $\mathbb{E}_1$-ring. Recall that the homotopy groups $\pi_* R$ have the structure of a graded ring and that if M is a (left or right) module spectrum over R, then $\pi_* M$ is a graded (left or right) module over $\pi_* R$. We can regard $\pi_* R$ as a kind of "first approximation" to R, and the ordinary tensor product of graded $\pi_* R$-modules as a "first approximation" to the relative tensor

小红书
小红书号:3189205503 qq

product over R. More precisely, suppose we are given objects $M \in \mathrm{RMod}_R$ and $N \in \mathrm{LMod}_R$, together with homotopy classes $x \in \pi_m M$ and $y \in \pi_n N$. Then x and y are represented by maps $R[m] \to R$ and $R[n] \to R$ in RMod_R and LMod_R, respectively. Combining these, we obtain a map of spectra

$$R[m+n] \simeq R[m] \otimes_R R[n] \xrightarrow{(x,y)} M \otimes_R N.$$

The image of the identity $1 \in \pi_0 R \simeq \pi_{m+n} R[m+n]$ is an element of $\pi_{m+n}(M \otimes_R N)$, which we will denote by $x \otimes y$. It is not difficult to see that the construction $(x, y) \mapsto x \otimes y$ is $\pi_* R$-bilinear, and therefore induces a map of graded abelian groups

$$\mathrm{Tor}_0^{\pi_* R}(\pi_* M, \pi_* N) \to \pi_*(M \otimes_R N).$$

This map is generally not an equivalence without some strong additional assumptions.

Definition 7.2.1.16. Let R be an $\mathbb{E}_1$-ring and let N be a left R-module spectrum. We say that M is *quasi-free* if $N \simeq \bigoplus_{\alpha \in A} R[n_\alpha]$ for some integers n_α. We let $\mathrm{LMod}_R^{\mathrm{qf}}$ denote the full subcategory of LMod_R spanned by the quasi-free left R-modules.

Proposition 7.2.1.17. *Let R be an $\mathbb{E}_1$-ring and let N be a quasi-free left R-module. For any R-module M, the map*

$$\mathrm{Tor}_0^{\pi_* R}(\pi_* M, \pi_* N) \to \pi_*(M \otimes_R N)$$

is an isomorphism of graded abelian groups.

Proof. Both sides are compatible with the formation of direct sums and suspensions. We may therefore assume that $N = R$, in which case the result is obvious. □

We can obtain information about the homotopy groups of an arbitrary tensor product $M \otimes_R N$ by resolving N by quasi-free R-modules.

Construction 7.2.1.18. Let R be an $\mathbb{E}_1$-ring and let $M \in \mathrm{RMod}_R$. If $P_\bullet$ is any simplicial object in LMod_R, then we can regard $M \otimes_R P_\bullet$ as a simplicial object in the ∞-category of Sp. Applying Remark 1.2.4.4, we obtain a spectral sequence of abelian groups $\{E_r^{p,q}, d_r\}_{r \geq 1}$ converging to $\pi_* M \otimes_R |P_\bullet|$, where $E_1^{*,q}$ is the normalized chain complex associated to the simplicial abelian group $\pi_q(M \otimes_R P_\bullet)$. If $P'_\bullet$ is another simplicial left R-module with associated spectral $\{E'^{p,q}_r, d'_r\}_{r \geq 1}$, then a map of simplicial objects $P_\bullet \to P'_\bullet$ induces a map of spectral sequences $\{E_r^{p,q}, d_r\}_{r \geq 1} \to \{E'^{p,q}_r, d'_r\}_{r \geq 1}$. If $f, g : P_\bullet \to P'_\bullet$ are simplicially homotopic maps of simplicial objects, then Remark 7.2.1.10 implies that the induced maps of chain complexes $E_1^{*,q} \to E_1'^{*,q}$ are chain homotopic, so that f and g induce the same map $E_r^{p,q} \to E_r'^{p,q}$ for $r = 2$ and therefore for $r \geq 2$.

Let S be the collection of all left R-modules of the form $R[n]$, where n is an integer, and let $\mathcal{C}'$ be the full subcategory of $\mathrm{Fun}(\mathrm{N}(\mathbf{\Delta})^{\mathrm{op}}, \mathrm{LMod}_R)$ spanned by the S-free simplicial objects. Let $\mathcal{A}$ denote the abelian category whose objects are spectral sequences $\{E_r^{p,q}, d_r\}_{r \geq 2}$ which begin at the

小红书
小红书号:3189205503 qq

second page. The above construction determines a functor $F_0 : \mathrm{h}\mathcal{C}' \to \mathcal{A}$ which carries simplicially homotopic morphisms to the same morphism in $\mathcal{A}$. Applying Proposition 7.2.1.11, we obtain a functor $F : \mathrm{hLMod}_R \to \mathcal{A}$ together with a natural transformation $F_0(P_\bullet) \to F(|P_\bullet|)$ which is an equivalence whenever $P_\bullet$ is an S-hypercovering of $|P_\bullet|$.

Let R be an $\mathbb{E}_1$-ring and suppose we are given modules $M \in \mathrm{RMod}_R$, $N \in \mathrm{LMod}_R$. Let $\{E_r^{p,q}, d_r\}_{r \geq 2}$ be the spectral sequence determined by Construction 7.2.1.18. Unwinding the definitions, we see that $\{E_r^{p,q}, d_r\}_{r \geq 2}$ is the spectral sequence associated to the simplicial spectrum $M \otimes_R P_\bullet$, where $P_\bullet$ is an S-free S-hypercovering of N. A choice of $P_\bullet$ gives a well-defined E_1-page for the spectral sequence, where for each $q \in \mathbf{Z}$, the chain complex $(E_1^{*,q}, d_1)$ is the normalized chain complex associated to the simplicial abelian group $\pi_q(M \otimes_R P_\bullet)$. Since $P_\bullet$ is S-free, each P_n is a quasi-free left R-module, so Proposition 7.2.1.17 gives an isomorphism of graded abelian groups

$$\mathrm{Tor}_0^{\pi_* R}(\pi_* M, \pi_* P_\bullet) \to \pi_*(M \otimes_R P_\bullet).$$

Since $P_\bullet$ is an S-hypercovering of N, the normalized chain complex associated to $\pi_* P_\bullet$ is a resolution of $\pi_* N$ by graded-free left $\pi_* R$-modules. Passing to homology, we obtain a canonical isomorphism

$$E_2^{p,*} \simeq \mathrm{Tor}_p^{\pi_* R}(\pi_* M, \pi_* N).$$

We have proven the following:

Proposition 7.2.1.19. *Let R be an $\mathbb{E}_1$-ring, let M be a right A-module, and let N be a left A-module. We regard $\pi_* M$ and $\pi_* N$ as graded modules over the graded ring $\pi_* R$. Then there exists a spectral sequence $\{E_r^{p,q}, d_r\}_{r \geq 2}$ with E_2-page $E_2^{p,q} = \mathrm{Tor}_p^{\pi_* A}(\pi_* M, \pi_* N)_q$ which converges (as in the proof of Proposition 1.2.2.14) to $\pi_{p+q}(M \otimes_R N)$.*

Remark 7.2.1.20. The spectral sequence $\{E_r^{p,q}, d_r\}$ of Proposition 7.2.1.19 depends functorially on the triple (R, M, N).

Remark 7.2.1.21. Let R, M, and N be as in Proposition 7.2.1.19. We have constructed a spectral sequence $\{E_r^{p,q}, d_r\}_{r \geq 2}$ by choosing a resolution $P_\bullet$ of N by quasi-free left R-modules. Using exactly the same reasoning, we can construct another spectral sequence $\{E_r'^{p,q}, d_r\}_{r \geq 2}$ by choosing a resolution $Q_\bullet$ of M by quasi-free right R-modules. In fact, these two spectral sequences are canonically isomorphic. Both can be identified with the spectral sequence associated to the simplicial spectrum $[n] \mapsto Q_n \otimes_R P_n$.

We now give a few simple applications of Proposition 7.2.1.19.

Corollary 7.2.1.22. *Let R be an $\mathbb{E}_1$-ring, M a right R-module, and N a left R-module. Suppose that R, M, and N are discrete. Then there exists a canonical isomorphism*

$$\pi_n(M \otimes_R N) \simeq \mathrm{Tor}_n^{\pi_0 R}(\pi_0 M, \pi_0 N).$$

小红书

Corollary 7.2.1.23. *Let A be a connective $\mathbb{E}_1$-ring, M a connective right R-module, and R a connective left A-module. Then:*

(1) *The relative tensor product $M \otimes_R N$ is connective.*

(2) *There is a canonical isomorphism $\pi_0(M \otimes_R N) \simeq \pi_0 M \otimes_{\pi_0 R} \pi_0 N$ in the category of abelian groups.*

Proof. This follows from the spectral sequence of Proposition 7.2.1.19, since $E_2^{p,q}$ vanishes for $p < 0$ or $q < 0$, while $E_2^{0,0} \simeq \pi_0 M \otimes_{\pi_0 R} \pi_0 N$. □

Variant 7.2.1.24. Let R be an $\mathbb{E}_1$-ring. Using Propositions 4.8.2.18 and 4.2.1.33, we see that the ∞-category LMod_R is canonically enriched over the ∞-category of spectra. The formation of morphism objects determines a bifunctor

$$\mathrm{Mor}_R : \mathrm{LMod}_R^{\mathrm{op}} \times \mathrm{LMod}_R \to \mathrm{Sp}\,.$$

Arguing as in Construction 7.2.1.18, we can associate to every pair of objects $M, N \in \mathrm{LMod}_R$ a spectral sequence $\{E_r^{p,q}, d_r\}_{r \geq 2}$ in the *opposite* of the category of abelian groups, whose second page is given by $E_2^{p,q} \simeq \mathrm{Ext}^p_{\pi_* R}(\pi_* M, \pi_* N)_{-q}$. Since the t-structure on the ∞-category Sp is not compatible with sequential limits, some care must be taken with the convergence of this spectral sequence. In good cases, one can show that it converges to $\pi_{-p-q} \mathrm{Mor}_R(M, N)$. For example, if M and R are connective and $\pi_n N \simeq 0$ for $n \gg 0$, a strong convergence statement can be deduced from Proposition 1.2.4.5.

7.2.2 Flat and Projective Modules

Let R be a connective $\mathbb{E}_1$-ring. In this section, we will see that there is a good theory of flat and projective R-modules, which reduces to the classical theory in the case where R is discrete.

Definition 7.2.2.1. Let R be an $\mathbb{E}_1$-ring. We will say that a left R-module M is *free* if is equivalent to a coproduct of copies of R (where we view R as a left module over itself). We will say that a free left module M is *finitely generated* if it can be written as a finite coproduct of copies of R.

Suppose that R is connective. We will say that a map $f : M \to N$ of connective left R-modules is *surjective* if it induces a surjection of $\pi_0 R$-modules $\pi_0 M \to \pi_0 N$.

Warning 7.2.2.2. The notion of free module introduced in Definition 7.2.2.1 is different from the general notion of freeness considered in §4.2.4. If M_0 is a spectrum, then the tensor product $R \otimes M_0$ is generally not free as a left R-module (in the sense of Definition 7.2.2.1), unless we assume that M_0 is a coproduct of copies of the sphere spectrum.

Remark 7.2.2.3. Using the long exact sequence of homotopy groups associated to an exact triangle, we conclude that a map $f : M \to N$ of connective modules over a connective $\mathbb{E}_1$-ring is surjective if and only if $\mathrm{fib}(f)$ is also connective.

小红书
小红书号:3189205503 qq

Definition 7.2.2.4. Let R be a connective $\mathbb{E}_1$-ring. We will say that a left R-module P is *projective* if it is a projective object of the ∞-category $\mathrm{LMod}_R^{\mathrm{cn}}$ of connective left R-modules, in the sense of Definition HTT.5.5.8.18 .

Remark 7.2.2.5. The terminology of Definition 7.2.2.4 is potentially ambiguous: a projective left R-module is typically not projective as an object of LMod_R. However, there is little risk of confusion, since the ∞-category LMod_R has no nonzero projective objects.

The following criterion for projectivity is often convenient:

Proposition 7.2.2.6. *Let $\mathcal{C}$ be a stable ∞-category equipped with a left-complete t-structure. Let $P \in \mathcal{C}_{\geq 0}$. The following conditions are equivalent:*

(1) *The object P is projective in $\mathcal{C}_{\geq 0}$.*

(2) *For every $Q \in \mathcal{C}_{\geq 0}$, the abelian group $\mathrm{Ext}^1_{\mathcal{C}}(P, Q)$ vanishes.*

(3) *For every $Q \in \mathcal{C}_{\geq 0}$ and every integer $i > 0$, the abelian group $\mathrm{Ext}^i_{\mathcal{C}}(P, Q)$ vanishes.*

(4) *For every $Q \in \mathcal{C}^{\heartsuit}$ and every integer $i > 0$, the abelian group $\mathrm{Ext}^i_{\mathcal{C}}(P, Q)$ vanishes.*

(5) *Given a fiber sequence*

$$N' \to N \to N'',$$

where $N', N, N'' \in \mathcal{C}_{\geq 0}$, the induced map $\mathrm{Ext}^0_{\mathcal{C}}(P, N) \to \mathrm{Ext}^0_{\mathcal{C}}(P, N'')$ is surjective.

Proof. It follows from Lemma 1.3.3.11 that $\mathcal{C}_{\geq 0}$ admits geometric realizations for simplicial objects, so that condition (1) makes sense. We first show that (1) $\Rightarrow$ (2). Let $f : \mathcal{C} \to \mathcal{S}$ be the functor corepresented by P. Let $M_\bullet$ be a Čech nerve for the morphism $0 \to Q[1]$, so that $M_n \simeq Q^n \in \mathcal{C}_{\geq 0}$. Then $Q[1]$ can be identified with the geometric realization $|M_\bullet|$. Since P is projective, $f(Q[1])$ is equivalent to the geometric realization $|f(M_\bullet)|$. We have a surjective map $* \simeq \pi_0 f(M_0) \to \pi_0 |f(M_\bullet)|$, so that $\pi_0 f(Q[1]) = \mathrm{Ext}^1_{\mathcal{C}}(P, Q) = 0$.

We now show that (2) $\Rightarrow$ (1). Proposition 1.4.2.22 implies that f is homotopic to a composition

$$\mathcal{C} \xrightarrow{F} \mathrm{Sp} \xrightarrow{\Omega^\infty} \mathcal{S},$$

where F is an exact functor. Applying (2), we deduce that F is right t-exact (Definition 1.3.3.1). Lemma 1.3.3.11 implies that the induced map $\mathcal{C}_{\geq 0} \to \mathrm{Sp}^{\mathrm{conn}}$ preserves geometric realizations of simplicial objects. Applying Proposition 1.4.3.9, we conclude that $f | \mathcal{C}_{\geq 0}$ preserves geometric realizations as well.

The implications (3) $\Rightarrow$ (2) and (3) $\Rightarrow$ (4) are obvious. The implication (2) $\Rightarrow$ (3) follows by replacing Q by $Q[i-1]$, and (2) $\Rightarrow$ (5) follows immediately from the exactness of the sequence

$$\mathrm{Ext}^0_{\mathcal{C}}(P, N) \to \mathrm{Ext}^0_{\mathcal{C}}(P, N'') \to \mathrm{Ext}^1_{\mathcal{C}}(P, N').$$

小红书
小红书号:3189205503 qq

We next show that (5) $\Rightarrow$ (2). Let $Q \in \mathcal{C}_{\geq 0}$ and let $\eta \in \mathrm{Ext}^1_{\mathcal{C}}(P, Q)$. Then η classifies a fiber sequence

$$Q \to Q' \xrightarrow{g} P.$$

Since $Q, P \in \mathcal{C}_{\geq 0}$, we have $Q' \in \mathcal{C}_{\geq 0}$ as well. Invoking (5), we deduce that g admits a section, so that $\eta = 0$.

We now complete the proof by showing that (4) $\Rightarrow$ (2). Let $Q \in \mathcal{C}_{\geq 0}$. For every integer $n \geq 0$, we have a fiber sequence

$$(\pi_n Q)[n] \to \tau_{\leq n} Q \to \tau_{\leq n-1} Q,$$

which gives rise to an exact sequence of abelian groups

$$\mathrm{Ext}^{i+n}_{\mathcal{C}}(P, \pi_n Q) \to \mathrm{Ext}^i_{\mathcal{C}}(P, \tau_{\leq n} Q) \to \mathrm{Ext}^i_{\mathcal{C}}(P, \tau_{\leq n-1} Q) \to \mathrm{Ext}^{i+n+1}_{\mathcal{C}}(P, \pi_n Q).$$

It follows from condition (4) that the tower of abelian groups $\{\mathrm{Ext}^i_{\mathcal{C}}(P, \tau_{\leq n} Q)\}_{n \geq 0}$ is constant for $n > -i$. Since $\mathcal{C}$ is left complete, we have $Q \simeq \varprojlim \tau_{\leq n} Q$ so that $\mathrm{Ext}^i_{\mathcal{C}}(P, Q) \simeq \mathrm{Ext}^i_{\mathcal{C}}(P, \tau_{\leq n} Q)$ for any $n > -i$. In particular, for $i > 0$ we have $\mathrm{Ext}^i_{\mathcal{C}}(P, Q) \simeq \mathrm{Ext}^i_{\mathcal{C}}(P, \pi_0 Q) \simeq 0$. □

Proposition 7.2.2.7. *Let R be a connective $\mathbb{E}_1$-ring, and let P be a connective left R-module. The following conditions are equivalent:*

(1) *The left R-module P is projective.*

(2) *There exists a free R-module M such that P is a retract of M.*

Proof. Suppose first that P is projective. Choose a map of left R-modules $p : M \to P$, where M is free and the induced map $\pi_0 M \to \pi_0 P$ is surjective (for example, we can take M to be a direct sum of copies of R indexed by the set $\pi_0 P$). Invoking Proposition 7.2.2.6, we deduce that p admits a section (up to homotopy), so that P is a retract of M. This proves (2). To prove the converse, we observe that the collection of projective left R-modules is stable under retracts. It will therefore suffice to show that every free left R-module is projective. This follows immediately from the characterization given in Proposition 7.2.2.6. □

Remark 7.2.2.8. It follows from the proof of Proposition 7.2.2.7 that, if $\pi_0 P$ is a finitely generated left module over $\pi_0 R$, then we can choose M to be a finitely generated free R-module.

Corollary 7.2.2.9. *Let R be a connective $\mathbb{E}_1$-ring. The following conditions on a connective left R-module P are equivalent:*

(1) *The R-module P is projective, and $\pi_0 P$ is finitely generated as a $\pi_0 R$-module.*

(2) *The R-module P is a compact projective object of $(\mathrm{LMod}_R)_{\geq 0}$.*

(3) *There exists a finitely generated free R-module M such that P is a retract of M.*

小红书
小红书号:3189205503 qq

Proof. The equivalence (2) $\Leftrightarrow$ (3) follows by applying Corollary 4.7.3.18 to the composition

$$(\mathrm{LMod}_R)_{\geq 0} \to \mathrm{Sp}_{\geq 0} \overset{\Omega^\infty}{\to} \mathcal{S},$$

and invoking Example HTT.5.5.8.24 . The equivalence (1) $\Leftrightarrow$ (3) follows from Remark 7.2.2.8. □

Recall that, if N is a (discrete) left module over an associative ring R, we say that N is *flat* if the functor $M \mapsto M \otimes_R N$ is exact.

Definition 7.2.2.10. Let M be a left module over an $\mathbb{E}_1$-ring R. We will say that M is *flat* if the following conditions are satisfied:

(1) The homotopy group $\pi_0 M$ is flat as a left module over $\pi_0 R$, in the usual sense.

(2) For each $n \in \mathbf{Z}$, the natural map $\pi_n R \otimes_{\pi_0 R} \pi_0 M \to \pi_n M$ is an isomorphism of abelian groups.

Remark 7.2.2.11. Let R be a connective $\mathbb{E}_1$-ring. Then every flat left R-module is also connective.

Remark 7.2.2.12. Let R be a discrete $\mathbb{E}_1$-ring. A left R-module M is flat if and only if M is discrete, and $\pi_0 M$ is flat over $\pi_0 R$ (in the sense of classical algebra). In other words, Definition 7.2.2.10 is compatible with the usual definition of flatness.

Proposition 7.2.2.13. *Let R be an $\mathbb{E}_1$-ring, M a right R-module, and N a left R-module. Suppose that N is flat. For each $n \in \mathbf{Z}$, the canonical map*

$$\mathrm{Tor}_0^{\pi_0 R}(\pi_n M, \pi_0 N) \to \pi_n(M \otimes_R N)$$

is an isomorphism of abelian groups.

Proof. If N is flat, then $\mathrm{Tor}_p^{\pi_* R}(\pi_* M, \pi_* N)$ vanishes for $p > 0$, and is isomorphic to $\mathrm{Tor}_0^{\pi_0 R}(\pi_* M, \pi_0 N)$ for $p = 0$. It follows that the spectral sequence of Proposition 7.2.1.19 degenerates at the second page and yields the desired result. □

Our next goal is to prove an analogue of Lazard's theorem, which characterizes the class of flat modules over a connective $\mathbb{E}_1$-ring.

Lemma 7.2.2.14. *Let R be an $\mathbb{E}_1$-ring.*

(1) *The collection of flat left R-modules is stable under coproducts, retracts, and filtered colimits.*

(2) *Every free left R-module is flat. If R is connective, then every projective left R-module is flat.*

Proof. Assertion (1) is obvious, and (2) follows from Proposition 7.2.2.6. □

Theorem 7.2.2.15 (Lazard's Theorem)**.** *Let R be a connective $\mathbb{E}_1$-ring, and let N be a connective left A-module. The following conditions are equivalent:*

小红书
小红书号:3189205503 qq

(1) *The left R-module N can be obtained as a filtered colimit of finitely generated free modules.*

(2) *The left R-module N can be obtained as a filtered colimit of projective left A-modules.*

(3) *The left R-module N is flat.*

(4) *The functor $M \mapsto M \otimes_A N$ is left t-exact; in other words, it carries $(\mathrm{RMod}_R)_{\leq 0}$ into $\mathrm{Sp}_{\leq 0}$.*

(5) *If M is a discrete right R-module, then $M \otimes_R N$ is discrete.*

Proof. The implication (1) $\Rightarrow$ (2) is obvious, (2) $\Rightarrow$ (3) follows from Lemma 7.2.2.14, (3) $\Rightarrow$ (4) from Proposition 7.2.2.13, and (4) $\Rightarrow$ (5) from Corollary 7.2.1.23.

We next show that (5) $\Rightarrow$ (3). Suppose that (5) is satisfied. The functor $M \mapsto M \otimes_R N$ is exact, and carries the heart of RMod_R to the category of abelian groups. It therefore induces an exact functor from the abelian category of right $\pi_0 R$-modules to the category of abelian groups. According to Corollary 7.2.1.23, this functor is given by (classical) tensor product with the left $\pi_0 R$-module $\pi_0 N$. From the exactness we conclude that $\pi_0 N$ is a flat $\pi_0 R$-module.

We now prove that the natural map $\phi : \pi_n R \otimes_{\pi_0 R} \pi_0 N \to \pi_n N$ is an isomorphism for all $n \in \mathbf{Z}$. For $n < 0$, this follows from the assumption that both N and R are connective. If $n = 0$ there is nothing to prove. We may therefore assume that $n > 0$, and we work by induction on n. Let M be the discrete right R-module corresponding to $\pi_0 A$. The inductive hypothesis implies that $\mathrm{Tor}_p^{\pi_* A}(\pi_* M, \pi_* N)_q$ vanishes unless $p = q = 0$ or $q \geq n$. These Tor-groups can be identified with the E_2-terms of the spectral sequence of Proposition 7.2.1.19, which computes the homotopy groups of the discrete spectrum $M \otimes_R N$. Consequently, we have $E_\infty^{0,0} = E_2^{0,0} \simeq \pi_0 N$. A simple calculation shows that $E_2^{0,n} \simeq \mathrm{coker}(\phi)$, and that if ϕ is surjective then $E_2^{1,n} \simeq \ker(\phi)$. To complete the proof, it suffices to prove that $E_2^{i,n} \simeq *$ for $0 \leq i \leq 1$. To see this, we observe that the vanishing of the groups $E_2^{i-r,n+r-1}$ and $E_2^{i+r,n-r+1}$ for $r \geq 2$ implies that $E_2^{i,n} \simeq E_\infty^{i,n}$, and the latter is a subquotient of $\pi_{i+n}(M \otimes_R N)$, which vanishes in view of assumption (5).

To complete the proof, it will suffice to show that (3) implies (1). Let $\mathcal{C}$ be the full subcategory of LMod_R spanned by a set of representatives for all free, finitely generated R-modules. Then $\mathcal{C}$ is essentially small, and consists of compact projective objects of $(\mathrm{Mod}_R)_{\geq 0}$ which generate $(\mathrm{Mod}_R)_{\geq 0}$ under small colimits. It follows (see §HTT.5.5.8) that the inclusion $\mathcal{C} \subseteq \mathrm{LMod}_R$ induces an equivalence $\mathcal{P}_\Sigma(\mathcal{C}) \to \mathrm{LMod}_R^{\mathrm{cn}}$. Applying Lemma HTT.5.1.5.5 , we conclude that the identity functor from $\mathrm{LMod}_R^{\mathrm{cn}}$ is a left Kan extension of its restriction to $\mathcal{C}$. It follows that for every connective left R-module N, the canonical diagram $\mathcal{C}_{/N} = \mathcal{C} \times_{\mathrm{LMod}_R} (\mathrm{LMod}_R)_{/N} \to \mathrm{LMod}_R$ has N as a colimit. To complete the proof, it will suffice to show that $\mathcal{C}_{/N}$ is filtered provided that N is flat.

According to Proposition HTT.5.3.1.15 , it will suffice to verify the following conditions:

(i) For every finite collection of objects $\{X_i\}$ of $\mathcal{C}_{/N}$, there exists an object $X \in \mathcal{C}_{/N}$ together with morphisms $X_i \to X$.

小红书
小红书号:3189205503 qq

(*ii*) For every pair $X, Y \in \mathcal{C}_{/N}$, every nonnegative integer $n \geq 0$, and every map $S^n \to \mathrm{Map}_{\mathcal{C}_{/N}}(X, Y)$ in the homotopy category $\mathcal{H}$, there exists a morphism $Y \to Z$ in $\mathcal{C}_{/N}$ such that the induced map $S^n \to \mathrm{Map}_{\mathcal{C}}(X, Z)$ is nullhomotopic.

Assertion (*i*) follows immediately from the stability of $\mathcal{C}$ under finite coproducts. We now prove (*ii*). Suppose given a pair of maps $f : X \to N$ and $g : Y \to N$, respectively. We have a homotopy fiber sequence

$$\mathrm{Map}_{\mathcal{C}_{/N}}(f, g) \to \mathrm{Map}_{\mathcal{C}}(X, Y) \to \mathrm{Map}_{\mathrm{LMod}_R}(X, N).$$

Since LMod_R is stable, $\mathrm{Map}_{\mathcal{C}_{/N}}(f, g)$ is a torsor for $\mathrm{Map}_{\mathrm{LMod}_R}(X, \mathrm{fib}(g))$. It follows that any map $S^n \to \mathrm{Map}_{\mathrm{LMod}_R}(X, \mathrm{fib}(g))$ determines a homotopy class $\eta \in \mathrm{Ext}_R^{-n}(X, \mathrm{fib}(g))$. We wish to prove that there exists a commutative diagram

$$\begin{array}{ccc} Y & \longrightarrow & Z \\ & {\scriptstyle g} \searrow \quad \swarrow {\scriptstyle h} & \\ & N & \end{array}$$

such that the image of η in $\mathrm{Ext}_R^{-n}(X, \mathrm{fib}(h))$ vanishes. Arguing iteratively, we can reduce to the case where $X \simeq A$, so that η can be identified with an element of $\pi_n \mathrm{fib}(g)$.

Let $\eta' \in \pi_n Y$ denote the image of η. Our first step is to choose a diagram as above with the property that the image of η' in $\pi_n Z$ vanishes. We observe that η' lies in the kernel of the natural map $\pi_n(g) : \pi_n Y \to \pi_n N \simeq \mathrm{Tor}_0^{\pi_0 R}(\pi_n A, \pi_0 N)$. The classical version of Lazard's theorem (see [94]) implies that $\pi_0 N$ is isomorphic to a filtered colimit of free left $\pi_0 R$-modules. It follows that there exists a commutative diagram

$$\begin{array}{ccc} & & P \\ & {\scriptstyle \overline{k}} \nearrow \quad \searrow {\scriptstyle \overline{h}} & \\ \pi_0 Y & \xrightarrow{\pi_0 g} & \pi_0 N \end{array}$$

of left $\pi_0 R$-modules, where P is a finitely generated free module, and the image of η' in $\pi_n R \otimes_{\pi_0 R} P$ vanishes. Using the freeness of P, we can realize $\overline{h}$ as $\pi_0 h$, where $h : Z \to N$ is a morphism of left R-modules, and Z is a finitely generated free module with $\pi_0 Z \simeq P$. Similarly, we can realize $\overline{k}$ as $\pi_0 k$, where $k : Y \to Z$ is a morphism of left R-modules. Using the freeness of Y again, we conclude that the diagram

$$\begin{array}{ccc} & & Z \\ & {\scriptstyle k} \nearrow \quad \searrow {\scriptstyle h} & \\ Y & \xrightarrow{g} & N \end{array}$$

commutes in the homotopy category hLMod_R, and can therefore be lifted to a commutative triangle in LMod_A. By construction, the image of η' in $\pi_n Z$ vanishes. Replacing Y by Z, we may reduce to the case where $\eta' = 0$.

小红书
小红书号:3189205503 qq

We now invoke the exactness of the sequence

$$\pi_{n+1}N \to \pi_n \operatorname{fib}(g) \to \pi_n Y$$

to conclude that η is the image of a class $\eta'' \in \pi_{n+1}N \simeq \pi_{n+1}R \otimes_{\pi_0 R} \pi_0 N$. Invoking Lazard's theorem once more, we deduce the existence of a commutative diagram of left $\pi_0 A$-modules

$$\begin{array}{ccc} & Q & \\ \nearrow & & \searrow \\ \pi_0 Y & \xrightarrow{\pi_0 g} & \pi_0 N \end{array}$$

where Q is a finitely generated free module, and η'' is the image of some element of $\pi_{n+1}R \otimes_{\pi_0 R} N$. Arguing as before, we may assume that the preceding diagram is induced by a commutative triangle of left A-modules

$$\begin{array}{ccc} & Z & \\ \nearrow & & \searrow \\ Y & \xrightarrow{g} & N. \end{array}$$

Replacing Y by Z, we may assume that η'' lies in the image of the map $\pi_{n+1}Y \to \pi_{n+1}N$. The exactness of the sequence

$$\pi_{n+1}Y \to \pi_{n+1}N \to \pi_n \operatorname{fib}(g)$$

now implies that $\eta = 0$, as desired. This completes the proof of the implication (3) $\Rightarrow$ (1). □

We now study the behavior of flatness under base change.

Proposition 7.2.2.16. *Let $f : A \to B$ be a map of $\mathbb{E}_1$-rings, let $G : \mathrm{LMod}_B \to \mathrm{LMod}_A$ be the forgetful functor, and let $F : \mathrm{LMod}_A \to \mathrm{LMod}_B$ be a left adjoint to G (given by $M \mapsto B \otimes_A M$, in view of Proposition 4.6.2.17). Then:*

(1) *The functor F carries free (projective, flat) A-modules to free (projective, flat) B-modules.*

(2) *Suppose that B is free (projective, flat) as a left A-module (that is, $G(B)$ is free, projective, or flat). Then G carries free (projective, flat) B-modules to free (projective, flat) A-modules.*

(3) *Suppose that, for every $n \geq 0$, the map f induces an isomorphism $\pi_n A \to \pi_n B$. Then F induces an equivalence of categories $\mathrm{LMod}_A^{\flat} \to \mathrm{LMod}_B^{\flat}$; here $\mathrm{LMod}_A^{\flat}$ denotes the full subcategory of LMod_A spanned by the flat left A-modules, and $\mathrm{LMod}_B^{\flat}$ is defined likewise.*

Proof. Assertions (1) and (2) are obvious. To prove (3), we first choose A' to be a connective cover of A (see Proposition 7.1.3.13). We have a homotopy commutative triangle of ∞-categories

$$\begin{array}{ccc} & \mathrm{LMod}_A^{\flat} & \\ \nearrow & & \searrow \\ \mathrm{LMod}_{A'}^{\flat} & \longrightarrow & \mathrm{LMod}_B^{\flat}. \end{array}$$

小红书
小红书号:3189205503 qq

It therefore suffices to prove the analogous assertion for the morphisms $A' \to A$ and $A' \to B$. In other words, we may reduce to the case where A is connective.

Since A is connective, the ∞-category Mod_A admits a t-structure. Let F' denote the composite functor

$$(\mathrm{LMod}_A)_{\geq 0} \subseteq \mathrm{LMod}_A \xrightarrow{F} \mathrm{Mod}_B .$$

Then F' has a right adjoint, given by the composition $G' = \tau_{\geq 0} \circ G$. Assertion (1) implies that F' preserves flatness, and a simple calculation of homotopy groups shows that G' preserves flatness as well. Consequently, F' and G' induce adjoint functors

$$\mathrm{LMod}_A^{\flat} \underset{G''}{\overset{F''}{\rightleftarrows}} \mathrm{LMod}_B^{\flat} .$$

It now suffices to show that the unit and counit of the adjunction are equivalences. In other words, we must show:

(*i*) For every flat left A-module M, the unit map $M \to \tau_{\geq 0} B \otimes_A M$ is an equivalence. For this, it suffices to show that $\pi_i M \simeq \pi_i \tau_{\geq 0} B \otimes_A M$ is an isomorphism for $i \in \mathbf{Z}$. If $i < 0$, then both groups vanish, so there is nothing to prove. If $i \geq 0$, then we must show that $\pi_i M \simeq \pi_i (B \otimes_A M)$, which follows immediately from Proposition 7.2.2.13 and the assumption that $\pi_i A \simeq \pi_i B$.

(*ii*) For every flat left B-module N, the counit map $B \otimes_A \tau_{\geq 0} G(N) \to N$ is an equivalence. In other words, we must show that for each $j \in \mathbf{Z}$, the map $\pi_j (B \otimes_A \tau_{\geq 0} G(N)) \to \pi_j N$ is an isomorphism of abelian groups. Since $G(N)$ is flat over A, Proposition 7.2.2.13 implies that the left side is given by $\pi_j B \otimes_{\pi_0 A} \pi_0 N$. The desired result now follows immediately from our assumption that N is flat.

□

In general, if M is a flat left module over an $\mathbb{E}_1$-ring R, then then "global" properties of M as an R-module are often controlled by "local" properties of $\pi_0 R$, viewed as a left module over the discrete ring $\pi_0 R$. Our next pair of results illustrates this principle.

Lemma 7.2.2.17. *Let R be an $\mathbb{E}_1$-ring and let $f : M \to N$ be a map of flat left R-modules. Then f is an equivalence if and only if it induces an isomorphism $\pi_0 M \to \pi_0 N$.*

Proof. This follows immediately from the definition of flatness. □

Proposition 7.2.2.18. *Let R be a connective $\mathbb{E}_1$-ring. A flat left R-module M is projective if and only if $\pi_0 M$ is a projective module over $\pi_0 R$.*

小红书
小红书号:3189205503 qq

Proof. Suppose first that $\pi_0 M$ is freely generated by elements $\{\eta_i\}_{i \in I}$. Let $P = \bigoplus_{i \in I} R$, and let $f : P \to M$ be a map represented by $\{\eta_i\}_{i \in I}$. By construction, f induces an isomorphism $\pi_0 P \to \pi_0 M$. Lemma 7.2.2.17 implies that f is an equivalence, so that M is free.

In the general case, there exists a free $\pi_0 R$-module F_0 and a direct sum decomposition $F_0 \simeq N_0 \oplus \pi_0 M$. Replacing F_0 by $\oplus_{n \geq 0} F_0$ if necessary, we may assume that N_0 is itself free. The projection map $F_0 \to \pi_0 M$ is induced by a map $g : F \to M$ of left R-modules, where F is free. Then g induces a surjection $\pi_0 F \simeq F_0 \to \pi_0 M$. Using the flatness of M, we conclude that the maps

$$\pi_i F \simeq \pi_i R \otimes_{\pi_0 R} \pi_0 F \to \pi_i R \otimes_{\pi_0 R} \pi_0 M \simeq \pi_i M$$

are also surjective. Let N be a fiber of g, so that we have a commutative diagram

$$\begin{array}{ccccccccc} 0 & \longrightarrow & \pi_i R \otimes_{\pi_0 R} \pi_0 N & \longrightarrow & \pi_i R \otimes_{\pi_0 R} \pi_0 F & \longrightarrow & \pi_i R \otimes_{\pi_0 R} \pi_0 M & \longrightarrow & 0 \\ & & \downarrow{\scriptstyle \phi'} & & \downarrow{\scriptstyle \phi} & & \downarrow{\scriptstyle \phi''} & & \\ 0 & \longrightarrow & \pi_i N & \longrightarrow & \pi_i F & \longrightarrow & \pi_i M & \longrightarrow & 0. \end{array}$$

Using the flatness of F and M, we deduce that the upper row is short exact, and that the maps ϕ and ϕ'' are isomorphisms. The snake lemma implies that ϕ' is an isomorphism; moreover, $\pi_0 N$ is isomorphic to the kernel of a surjection between flat $\pi_0 R$-modules, and is therefore itself flat. It follows that N is a flat R-module. Since $\pi_0 N$ is free, the first part of the proof shows that N is itself free.

Let $p : N \to F$ denote the natural map. Since $\pi_0 M$ is projective, the inclusion $\pi_0 N \subseteq \pi_0 F$ is split. Since F is free, we can lift this splitting to a morphism $q : F \to N$. Then $q \circ p : N \to N$ induces the identity map from $\pi_0 N$ to itself. Since N is free, we conclude that there is a homotopy $q \circ p \simeq \mathrm{id}_N$. It follows that N is a direct summand of F in the homotopy category $\mathrm{h}\mathcal{C}$. Consequently, $M \simeq \mathrm{cofib}(p)$ can be identified with the complementary summand, and is therefore projective. $\square$

Corollary 7.2.2.19. *Let $f : R \to R'$ be a map of connective $\mathbb{E}_1$-rings. Let $\mathrm{Proj}(R)$ denote the full subcategory of LMod_R spanned by the projective left R-modules, and define $\mathrm{Proj}(R')$ similarly. Suppose that f induces an isomorphism $\pi_0 R \to \pi_0 R'$. Then the base change functor $M \mapsto R' \otimes_R M$ induces an equivalence of homotopy categories*

$$\phi : \mathrm{hProj}(R) \to \mathrm{hProj}(R').$$

Proof. We first show that the functor ϕ is fully faithful. For this, we must show that if P and Q are projective left R-modules, then the canonical map

$$\mathrm{Ext}^0_R(P, Q) \to \mathrm{Ext}^0_{R'}(R' \otimes_R P, R' \otimes_R Q)$$

is bijective. Without loss of generality, we may suppose that P is free. In this case, the left hand side can be identified with a product of copies of $\pi_0 Q$, while the right hand side can be identified

小红书
小红书号:3189205503 qq

with a product of copies of $\pi_0(R' \otimes_R Q)$. Since Q is connective, the latter module can be identified with $\mathrm{Tor}_0^{\pi_0 R}(\pi_0 R', \pi_0 Q)$ (Corollary 7.2.1.23), which is isomorphic to $\pi_0 Q$ in view of our assumption that f induces an isomorphism $\pi_0 R \to \pi_0 R'$.

We now prove that ϕ is essentially surjective. Let $\overline{P}$ be a projective R'-module. Then there exists a free R'-module $\overline{F}$ and an idempotent map $\overline{e} : \overline{F} \to \overline{F}$, so that $\overline{P}$ can be identified with the colimit of the sequence

$$\overline{F} \xrightarrow{\overline{e}} \overline{F} \xrightarrow{\overline{e}} \cdots.$$

Choose a free left R-module F and an equivalence $\phi(F) \simeq \overline{F}$. Using the first part of the proof, we deduce the existence of a map $e : F \to F$ (not necessarily idempotent) such that the diagram

$$\begin{array}{ccc} \phi(F) & \xrightarrow{\phi(e)} & \phi(F) \\ \downarrow & & \downarrow \\ \overline{F} & \xrightarrow{\overline{e}} & \overline{F} \end{array}$$

commutes up to homotopy. Since the functor $M \mapsto R' \otimes_R M$ preserves colimits, we deduce that $\overline{P}$ is equivalent to $\phi(P)$, where P denotes the colimit of the sequence

$$F \xrightarrow{e} F \xrightarrow{e} \cdots.$$

To complete the proof, it will suffice to show that P is projective. In view of Proposition 7.2.2.18, it will suffice to show that $\pi_0 P$ is a projective module over the ordinary associative ring $\pi_0 R$, and that P is a flat R-module. The first assertion follows from the isomorphism

$$\pi_0 P \simeq \pi_0(R' \otimes_R P) \simeq \pi_0 \overline{P},$$

and the second from the observation that the collection of flat left R-modules is stable under filtered colimits (Lemma 7.2.2.14). □

Remark 7.2.2.20. Let A be an $\mathbb{E}_1$-ring, and let P be a projective left A-module. Then P is a finitely generated projective left A-module if and only if $\pi_0 P$ is finitely generated as a (discrete) left module over $\pi_0 A$. The "only if" direction is obvious. For the converse, suppose that $\pi_0 P$ is generated by a finite set of elements $\{x_i\}_{i \in I}$. Let M be the (finitely generated) free module on a set of generators $\{X_i\}_{i \in I}$, so that we have a canonical map $\phi : M \to P$. Since P is projective and ϕ induces a surjection $\pi_0 M \to \pi_0 P$, the map ϕ splits (Proposition 7.2.2.6), so that P is a direct summand of M.

Remark 7.2.2.21. Let R be an $\mathbb{E}_2$-ring, and regard the ∞-category LMod_R as a monoidal ∞-category (whose monoidal structure is given by relative tensor product over R). Then $\pi_0 R$ is a commutative ring. The proof of Proposition 7.2.1.19 gives a spectral sequence $\{E_r^{p,q}, d_r\}_{r \geq 2}$ in the category of $\pi_0 R$-modules with

$$E_2^{p,q} = \mathrm{Tor}_p^{\pi_* R}(\pi_* M, \pi_* N)_q,$$

小红书 小红书号:3189205503 qq

which converges to $\pi_{p+q}(M \otimes_R N)$. If M or N is flat over R, then $E_2^{p,q}$ vanishes for $p \neq 0$. It follows that this spectral sequence degenerates at the E_2-page, and we get a canonical isomorphism

$$\pi_*(M \otimes_R N) \simeq E_2^{0,*} \simeq \mathrm{Tor}_0^{\pi_* R}(\pi_* M, \pi_* N).$$

It follows that if M and N are both flat over R, then the relative tensor product $M \otimes_R N$ is again flat over R (this can also be deduced from Theorem 7.2.2.15). Since the unit object $R \in \mathrm{LMod}_R$ is flat, Proposition 2.2.1.1 implies that the full subcategory $\mathrm{LMod}_R^\flat \subseteq \mathrm{LMod}_R$ inherits the structure of a monoidal ∞-category.

If R is an $\mathbb{E}_{k+1}$-ring, then $\mathrm{LMod}_R^\flat$ inherits the structure of an $\mathbb{E}_k$-monoidal ∞-category. If A is an $\mathbb{E}_k$-algebra over R, then we will say that A is *flat over* R if A is flat when regarded as a left R-module. We let $\mathrm{Alg}_R^{(k),\flat}$ denote the full subcategory of $\mathrm{Alg}_R^{(k)}$ spanned by the flat $\mathbb{E}_k$-algebras. If $k = \infty$, we will denote $\mathrm{Alg}_R^{(k),\flat}$ by $\mathrm{CAlg}_R^\flat$.

Remark 7.2.2.22. Let R be an $\mathbb{E}_\infty$-ring. Combining Corollary 3.4.1.7 with Remark 7.2.2.21, we can identify the ∞-category $\mathrm{CAlg}_R^\flat$ with the full subcategory of $\mathrm{CAlg}_{R/}$ spanned by those morphisms $\phi : R \to A$ which exhibit A as a flat module (either left or right) over R.

Remark 7.2.2.23. Let R be an $\mathbb{E}_{k+1}$-ring and let A be a flat $\mathbb{E}_k$-algebra over R. If R is connective, then A is also connective; if R is discrete, then A is also discrete.

From Proposition 7.2.2.16, we immediately deduce the following:

Proposition 7.2.2.24. *Let $f : R \to R'$ be a map of $\mathbb{E}_{k+1}$-rings. Suppose that f induces an isomorphism $\pi_i R \to \pi_i R'$ for all $i \geq 0$. Then the tensor product functor $A \mapsto R' \otimes_R A$ induces an equivalence from the ∞-category $\mathrm{Alg}_R^{(k),\flat}$ of flat $\mathbb{E}_k$-algebras over R to the ∞-category $\mathrm{Alg}_{R'}^{(k),\flat}$ of flat $\mathbb{E}_k$-algebras over R'.*

7.2.3 Localizations and Ore Conditions

Let R be a commutative ring and let S be a subset of R which contains the unit and is closed under multiplication. In this case, one can define a commutative ring $R[S^{-1}]$ together with a ring homomorphism $\phi : R \to R[S^{-1}]$ with the following universal property: if R' is any other commutative ring, the composition with ϕ induces a bijection from the set of ring homomorphisms $R[S^{-1}] \to R'$ to the set of ring homomorphisms from R into R' which carry each element of S to an invertible element in R'. The ring $R[S^{-1}]$ can be described concretely as follows: elements of $R[S^{-1}]$ are equivalence classes of symbols $\frac{x}{s}$, where $x \in R$ and $s \in S$; here we let $\frac{x}{s} = \frac{x'}{s'}$ if and only if there exists an element $t \in S$ such that $xs't = x'st$.

Now suppose that R is an associative ring and that S is a multiplicatively closed subset of R. By general nonsense, one can construct a new associative ring $R[S^{-1}]$ by freely adjoining to R multiplicative inverses for the elements of S. There is generally no easy description of the ring $R[S^{-1}]$: for example, it can be very difficult to decide whether the map $R \to R[S^{-1}]$ is injective. However, we can do much better if we are willing to introduce a suitable assumption on S.

小红书
小红书号:3189205503 qq

Definition 7.2.3.1. Let R be an associative ring and let S be a subset of R. We say that S satisfies the *left Ore condition* if the following hold:

(a) The set S contains the unit element of R and is closed under multiplication.

(b) For every pair of elements $x \in R$, $s \in S$, there exist elements $y \in R$ and $t \in S$ such that $tx = ys$.

(c) Let $x \in R$ be an element for which there exists $s \in S$ such that $xs = 0$. Then there exists an element $t \in S$ such that $tx = 0$.

Remark 7.2.3.2. Conditions (b) and (c) of Definition 7.2.3.1 are automatic if the ring R is commutative, or more generally if the set S is contained in the center of R.

Remark 7.2.3.3. We say that a set $S \subseteq R$ satisfies the *right Ore condition* if it satisfies condition (a) of Definition 7.2.3.1, together with the following versions of (b) and (c):

(b') For every pair of elements $x \in R$, $s \in S$, there exist elements $y \in R$ and $t \in S$ such that $xt = sy$.

(c') Let $x \in R$ be an element for which there exists $s \in S$ such that $sx = 0$. Then there exists an element $t \in S$ such that $xt = 0$.

Equivalently, $S \subseteq R$ satisfies the right Ore condition if it satisfies the left Ore condition when viewed as a subset of R^{rev}, the same ring with the opposite multiplication.

Construction 7.2.3.4. Let R be an associative ring, let $S \subseteq R$ be a subset which satisfies the left Ore condition, and let M be a left R-module. We define a relation $\sim$ on the product $S \times M$ as follows: we have $(s, x) \sim (s', x')$ if there exists elements $a, a' \in R$ such that the products as and $a's'$ belong to S, $as = a's'$, and $ax = a'x'$. It is obvious that this relation is symmetric and reflexive. It is also reflexive: if $(s, x) \sim (s', x') \sim (s'', x'')$, then we can choose elements $a, a', b', b'' \in R$ such that

$$as = a's' \in S \quad b's' = b''s'' \in S \quad ax = a'x' \quad b'x' = b''x''.$$

Since S satisfies condition (b) of Definition 7.2.3.1, we can find elements $u \in S$, $c \in R$ such that $ua's' = cb's'$. Thus $ua' - cb'$ is annihilated by right multiplication by $s' \in S$; using condition (c), we deduce that $ua' - cb'$ is annihilated by left multiplication by some element $t \in S$. Then

$$tuas = tua's' = tcb's' = tcb''s'',$$

and this product belongs to S since $t, u, as \in S$ and S is closed under multiplication. To prove that $(s, x) \sim (s'', x'')$, it suffices to observe that

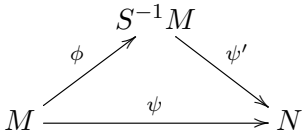
$$tuax = tua'x' = tcb'x' = tcb''x''.$$

小红书
小红书号:3189205503 qq

Let $S^{-1}M$ denote the quotient of $S \times M$ by the equivalence relation $\sim$. We denote the image of a pair (s, x) in $S^{-1}M$ by $s^{-1}x$. We refer to $S^{-1}M$ as the *left module of fractions* associated to the pair (S, M). There is a canonical map $\phi : M \to S^{-1}M$, given by $\phi(x) = 1^{-1}x$.

We now summarize the some of the main properties of Construction 7.2.3.4.

Proposition 7.2.3.5. *Let R be an associative ring, let $S \subseteq R$ be a subset which satisfies the left Ore condition, and let M be a left module over R. Then:*



(1) *The set $S^{-1}M$ admits a unique R-module structure satisfying the following pair of conditions:*

   (a) *The canonical map $\phi : M \to S^{-1}M$ is an R-module homomorphism.*

   (b) *For every pair of elements $s \in S$, $x \in M$, we have $\phi(x) = s(s^{-1}x)$.*

(2) *For each $s \in S$, multiplication by s induces a bijection from $S^{-1}M$ to itself.*

(3) *Let N be another left R-module, and assume that for each $s \in S$, left multiplication by s induces a bijection from N to itself. For every R-module homomorphism $\psi : M \to N$, there exists a unique R-module homomorphism $\psi' : S^{-1}M \to N$ such that the diagram*

   is commutative.

(4) *Suppose that $M = R$. Then there is a unique associative ring structure on $S^{-1}M = S^{-1}R$ such that $\phi : R \to S^{-1}R$ is a ring homomorphism satisfying condition (b) above.*

(5) *The ring homomorphism ϕ carries each element of S to an invertible element of $S^{-1}R$.*

(6) *Let A be an associative ring, and let $\psi : R \to A$ be a ring homomorphism with the property that for each $s \in S$, the image $\psi(s) \in A$ is invertible. Then there exists a unique ring homomorphism $\psi' : S^{-1}R \to A$ such that the diagram*

   is commutative.

Remark 7.2.3.6. Let R be an associative ring and let $S \subseteq R$ be a subset. If S satisfies the left Ore condition, then we can define a left ring of fractions $S^{-1}R$ as in Proposition 7.2.3.5. If S also satisfies the right Ore condition, then the dual version of Proposition 7.2.3.5 allows us to construct a right ring of fractions RS^{-1}. It follows from assertion (5) of Proposition 7.2.3.5 that there is a canonical isomorphism $S^{-1}R \simeq RS^{-1}$.

小红书
小红书号:3189205503 qq

It is not difficult (though somewhat tedious) to prove Proposition 7.2.3.5 by direct calculation. In this section, we will give a different proof of a more general result, where the associative ring R is replaced by an $\mathbb{E}_1$-ring and M by a left R-module spectrum.

Remark 7.2.3.7. Let R be an $\mathbb{E}_1$-ring, and regarded $\pi_* R$ as a graded associative ring. Let S be a set of homogeneous elements of $\pi_* R$ which satisfies the left Ore condition. In particular, we have the following:

(b) For every pair of elements $x \in \pi_* R$, $s \in S$, there exist elements $y \in \pi_* R$ and $t \in S$ such that $tx = ys$.

(c) Let $x \in \pi_* R$ be an element for which there exists $s \in S$ such that $xs = 0$. Then there exists an element $t \in S$ such that $tx = 0$.

Note that it suffices to verify conditions (b) and (c) in the case where x is a homogeneous element of $\pi_* R$. Moreover, in case (b), we may assume that the element y is also homogeneous.

Definition 7.2.3.8. Let R be an $\mathbb{E}_1$-ring and let $S \subseteq \pi_* R$ be a set of homogeneous elements which contains the unit and is closed under multiplication. Suppose that M is a left R-module spectrum. We will say that M is *S-nilpotent* if, for every $x \in \pi_n M$, there exists an element $s \in S$ such that $sx = 0$.

Lemma 7.2.3.9. *Let R be an $\mathbb{E}_1$-ring and let $S \subseteq \pi_* R$ be a set of homogeneous elements which contains the unit and is closed under multiplication. Suppose we are given a fiber sequence*

$$M' \xrightarrow{\psi} M \xrightarrow{\phi} M''$$

in LMod_R. *If any two of the left A-modules M, M', and M'' are S-nilpotent, then so it the third.*

Remark 7.2.3.10. Let R be an $\mathbb{E}_1$-ring and let $S \subseteq \pi_* R$ be a set of homogeneous elements which contains the unit and is closed under products. It is easy to see that the collection of S-nilpotent left R-modules is closed under shifts and (possibly infinite) coproducts. Combining this observation with Lemma 7.2.3.9, we deduce that the collection of S-nilpotent left R-modules is a stable subcategory of LMod_R, which is closed under small colimits.

Proof of Lemma 7.2.3.9. For the sake of definiteness, suppose that M' and M'' are S-nilpotent; we will show that M is S-nilpotent. Let $x \in \pi_n M$ for some integer n. Since M'' is S-nilpotent, the image $\phi(x) \in \pi_n M''$ is annihilated by multiplication by some element $s \in S$ having degree d. Then $\phi(sx) = s\phi(x) = 0$, so that sx belongs to to the kernel of the map $\pi_{n+d} M \to \pi_{n+d} M''$. The exactness of the sequence

$$\pi_{n+d} M' \to \pi_{n+d} M \to \pi_{n+d} M''$$

implies that $sx = \psi(y)$ for some element $y \in \pi_{n+d} M'$. Since M' is S-nilpotent, there exists an element $t \in S$ such that $ty = 0$. Then $(ts)x = t(sx) = t\psi(y) = \psi(ty) = 0$. □

小红书
小红书号:3189205503 qq

The left Ore condition of Definition 7.2.3.1 has a convenient reformulation in terms of S-nilpotent modules.

Lemma 7.2.3.11. *Let R be an $\mathbb{E}_1$-ring and let $S \subseteq \pi_* R$ be a set of homogeneous elements which contains the unit and is closed under multiplication. The following conditions are equivalent:*

(1) *The set S satisfies the left Ore condition.*

(2) *For every element $s \in S$ of degree d, if R/Rs denotes the cofiber of the map of left R-modules $R[d] \to R$ given by right multiplication by s, then R/Rs is S-nilpotent.*

Proof. Assume first that (1) is satisfied. Let $x \in \pi_n R/Rs$; we wish to show that x is annihilated by some element of S. Using the exact sequence

$$\pi_n R/Rs \xrightarrow{\phi} \pi_{n-d-1} R \xrightarrow{s} \pi_{n-1} R,$$

we deduce that $\phi(x) \in \pi_{n-d-1} R$ is annihilated by right multiplication by s. Using condition (c) of Definition 7.2.3.1, we deduce that there exists an element $t \in S$ of degree d' such that $0 = t\phi(x) \in \pi_{n+d'-d-1}$. Using the exactness of the sequence

$$\pi_{n+d'} R \xrightarrow{\psi} \pi_{n+d'} R/Rs \to \pi_{n+d'-d-1} R$$

we conclude that $tx = \psi(y)$ for some $y \in \pi_{n+d'} R$. Using condition (b) of Definition 7.2.3.1 (and Remark 7.2.3.7), we conclude that there exists an element $u \in S$ of degree d'' and an element $z \in \pi_{n+d'+d''-d} R$ such that $uy = zs$. It follows that the image of uy in $\pi_{n+d'+d''} R/Rs$ vanishes, so that $(ut)x = 0$. This completes the proof of (2).

Now suppose that (2) is satisfied. We will show that S satisfies conditions (b) and (c) of Definition 7.2.3.1. Suppose first that $x \in \pi_* R$ and $s \in S$; we wish to show that there exists $y \in \pi_* R$ and $t \in S$ such that $tx = ys$. As noted in Remark 7.2.3.7, we may assume without loss of generality that x is homogeneous; say $x \in \pi_n R$. Let $s \in S$ have degree d. The image of x in $\pi_n R/Rs$ is annihilated by multiplication by some homogeneous element $t \in S$ of degree d'. It follows that tx belongs to the kernel of the map $\pi_{n+d'} R \to \pi_{n+d'} R/Rs$, and therefore to the image of the map $\pi_{n+d'-d} R \xrightarrow{s} \pi_{n+d'} R$ given by right multiplication by s.

We now verify (c). As noted in Remark 7.2.3.7, it suffices to show that if $x \in \pi_n R$ is annihilated right multiplication by some element $s \in S$ of degree d, then $tx = 0$ for some $t \in S$. The exactness of the sequence

$$\pi_{n+d+1} R/Rs \xrightarrow{\phi} \pi_n R \xrightarrow{s} \pi_{n+d} R$$

shows that $x = \phi(y)$ for some $y \in \pi_{n+d+1} R/Rs$. Since R/Rs is S-nilpotent, there exists an element $t \in S$ such that $ty = 0$, from which it follows immediately that $tx = t\phi(y) = 0$. □

Lemma 7.2.3.12. *Let R be an $\mathbb{E}_1$-ring and let $S \subseteq \pi_* R$ be a set of homogeneous elements which contains the unit and is closed under products. Let M be a left R-module which is S-nilpotent. Then there exists a map of left R-modules $f : N \to M$ with the following properties:*

小红书
小红书号:3189205503 qq

(1) *The left R-module N is isomorphic to a coproduct of left R-modules of the form $(R/Rs_\alpha)[n_\alpha]$, where the s_α are elements of S and R/Rs_α is defined as in Lemma 7.2.3.11.*

(2) *The map f induces a surjection of graded abelian groups $\pi_* N \to \pi_* M$.*

Proof. Let $y \in \pi_n M$. Then y is classified by a map of left R-modules $f_y : R[n] \to M$. Since M is S-nilpotent, we have $sy = 0$ for some element $s \in S$ of degree d. It follows that the composition

$$R[n+d] \xrightarrow{s} R[n] \xrightarrow{f_y} M$$

is nullhomotopic, so that f_y factors as a composition

$$R[n] \to (R/Rx)[n] \xrightarrow{f'_y} M.$$

Taking the coproduct of the maps f'_y over all homogeneous elements $y \in \pi_* M$, we obtain the desired map $f : N \to M$. □

Lemma 7.2.3.13. *Let R be an $\mathbb{E}_1$-ring and let $S \subseteq \pi_* R$ be a set of homogeneous elements which satisfies the left Ore condition. Let M be an S-nilpotent left R-module. Then there exists a sequence*

$$0 = M_0 \to M_1 \to M_2 \to \cdots$$

of left R-modules with the following properties:

(1) *For each $i \geq 0$, the fiber of the map $M_i \to M_{i+1}$ is a coproduct of left A-modules of the form $(R/Rs_\alpha)[n_\alpha]$, for some elements $s_\alpha \in S$ and integers n_α.*

(2) *The colimit $\varinjlim M_i$ is equivalent to M (as an object of LMod_A).*

Proof. We construct S-nilpotent left R-modules M_i and maps $f_i : M_i \to M$ using induction on i. When $i = 0$, set $M_i = 0$, so that $f_i : 0 \to M$ is determined up to a contractible space of choices. For the inductive step, assume that $f_i : M_i \to M$ has been constructed. Since M_i and M are S-nilpotent, the fiber K_i of f_i is also S-nilpotent. We may therefore choose a map $g_i : N_i \to K_i$ which induces a surjection on homotopy groups, where N_i is a coproduct of left A-modules of the form $(A/As)[n]$. Since S satisfies the left Ore condition, Remark 7.2.3.10 and Lemma 7.2.3.11 imply that N_i is S-nilpotent. We define M_{i+1} to be a cofiber of the composite map $N_i \xrightarrow{g_i} K_i \to M_i$. By construction, f_i admits a canonical factorization

$$M_i \longrightarrow M_{i+1} \xrightarrow{f_{i+1}} M.$$

Lemma 7.2.3.9 guarantees that M_{i+1} is also S-nilpotent.

The above construction obviously satisfies condition (1). To prove (2), note that for each i we have an exact triangle

$$N_i \to K_i \to K_{i+1}.$$

小红书
小红书号:3189205503 qq

Since the first map is surjective on homotopy, we conclude that the induced map $\pi_* K_i \to \pi_* K_{i+1}$ vanishes. It follows that $\pi_* \varinjlim K_i \simeq \varinjlim \pi_* K_i \simeq 0$, so that the map $\varinjlim M_i \simeq M$ is an equivalence. □

Proposition 7.2.3.14. *Let R be an $\mathbb{E}_1$-ring and let $S \subseteq \pi_* R$ be a set of homogeneous elements satisfying the left Ore condition. Let N be a left R-module. The following conditions are equivalent:*

(1) *For every element $s \in S$, left multiplication by s induces an isomorphism of graded abelian groups from $\pi_* N$ to itself.*

(2) *For every element $s \in S$ and every integer n, the mapping space $\mathrm{Map}_{\mathrm{LMod}_A}(R/Rs[n], N)$ is contractible.*

(3) *For every S-nilpotent object $M \in \mathrm{LMod}_A$, the mapping space $\mathrm{Map}_{\mathrm{LMod}_A}(M, N)$ is contractible.*

Proof. Let $s \in S$ be an element of degree d. The fiber sequence

$$R[d] \xrightarrow{s} R \to R/Rs$$

determines a long exact sequence

$$\mathrm{Ext}^n_R(R/Rs, N) \to \pi_{-n} N \xrightarrow{s} \pi_{d-n} N \to \mathrm{Ext}^{n+1}_R(R/Rs, N),$$

from which the equivalence (1) ⇔ (2) follows immediately. The implication (3) ⇒ (2) follows from Lemma 7.2.3.11. We now prove (2) ⇒ (3). Let $M \in \mathrm{LMod}_R$ be S-nilpotent, and choose a sequence

$$0 = M_0 \to M_1 \to M_2 \to \cdots$$

satisfying the hypotheses of Lemma 7.2.3.13. Since $M \simeq \varinjlim M_i$, we have

$$\mathrm{Map}_{\mathrm{LMod}_R}(M, N) \simeq \varprojlim \mathrm{Map}_{\mathrm{LMod}_R}(M_i, N).$$

It will therefore suffice to show that each mapping space $\mathrm{Map}_{\mathrm{LMod}_R}(M_i, N)$ is contractible. We proceed by induction on i, the case $i = 0$ being obvious. Assume that $\mathrm{Map}_{\mathrm{LMod}_R}(M_i, N)$ is contractible. We have a fiber sequence

$$\mathrm{Map}_{\mathrm{LMod}_R}(M_{i+1}, N) \to \mathrm{Map}_{\mathrm{LMod}_R}(M_i, N) \to \mathrm{Map}_{\mathrm{LMod}_R}(N_i, N),$$

where N_i is a coproduct of left R-modules of the form $(R/Rs_\alpha)[n_\alpha]$. It therefore suffices to show that $\mathrm{Map}_{\mathrm{LMod}_R}(N_i, N) \simeq \prod_\alpha \mathrm{Map}_{\mathrm{LMod}_R}((R/Rs_\alpha)[n], N)$ is contractible, which follows from (2). □

Definition 7.2.3.15. Let R be an $\mathbb{E}_1$-ring and let $S \subseteq \pi_* R$ be a set of homogeneous elements satisfying the left Ore condition. We will say that a left R-module N is *S-local* if it satisfies the equivalent conditions of Proposition 7.2.3.14. We let LMod_R^{S-nil} denote the full subcategory of LMod_R spanned by the S-nilpotent left R-modules, and $\mathrm{LMod}_R^{\mathrm{Loc}(S)}$ the full subcategory of LMod_R spanned by the S-local R-modules.

小红书
小红书号:3189205503 qq

Remark 7.2.3.16. It follows immediately from characterization (1) of Proposition 7.2.3.14 that $\mathrm{LMod}_R^{\mathrm{Loc}(S)}$ is a stable subcategory of LMod_R, which is closed under small coproducts and therefore under arbitrary small colimits.

In the situation of Definition 7.2.3.15, Remark 7.2.3.10 implies that LMod_R^{S-nil} is closed under small colimits in LMod_R. Moreover, there exists a set of objects which generate LMod_R^{S-nil} under small colimits: for example, the objects of the form $R/Rs[n]$, where $s \in S$ (Lemma 7.2.3.13). It follows that the ∞-category LMod_R^{S-nil} is presentable. Using Corollary HTT.5.5.2.9 , we deduce that the inclusion $\mathrm{LMod}_R^{S-nil} \to \mathrm{LMod}_R$ admits a right adjoint G. If $M \in \mathrm{LMod}_R^{S-nil}$ and $N \in \mathrm{LMod}_R$, then the counit map $u : G(N) \to N$ induces an equivalence $\mathrm{Ext}_R^i(M, G(N)) \to \mathrm{Ext}_R^i(M, N)$ for all integers i. It follows that the cofiber of u is S-local. We can summarize the situation as follows:

Proposition 7.2.3.17. *Let R be an $\mathbb{E}_1$-ring and let $S \subseteq \pi_* R$ be a set of homogeneous elements satisfying the left Ore condition. Then LMod_R^{S-nil} and $\mathrm{LMod}_R^{\mathrm{Loc}(S)}$ are stable subcategories of LMod_R, which are closed under small colimits. Moreover, the pair $(\mathrm{LMod}_R^{S-nil}, \mathrm{LMod}_R^{\mathrm{Loc}(S)})$ determines an accessible t-structure on LMod_R (with trivial heart).*

Remark 7.2.3.18. In the situation of Proposition 7.2.3.17, every object $M \in \mathrm{LMod}_R$ determines a fiber sequence

$$M' \to M \to M'',$$

where M' is S-nilpotent and M'' is S-local. This fiber sequence is determined by M up to contractible ambiguity, so we can regard M' and M'' as functors of M. We will denote M'' by $S^{-1}M$, and refer to it as the *S-localization of M*.

Our next goal is to describe the S-localization of a left R-module M more explicitly. In particular, we will see that the homotopy groups of $S^{-1}M$ can be computed using a graded analogue of Construction 7.2.3.4.

Construction 7.2.3.19. Let R be an $\mathbb{E}_1$-ring, let $S \subseteq \pi_* R$ be a set of homogeneous elements of $\pi_* R$ which satisfy the left Ore condition, and let M be a left R-module. For every integer d, let S_d denote the subset of S consisting of homogeneous elements of degree d. Let $\phi : M \to S^{-1}M$ be the canonical map. Let $s \in S_d$ and let $x \in \pi_{n+d} M$. Since left multiplication by s on $\pi_* M$ is bijective, there exists a unique element $\psi_{d,n}(s, x) \in \pi_n S^{-1} M$ such that $s \psi_{d,n}(s, x) = \phi(x)$.

Proposition 7.2.3.20. *Let R be an $\mathbb{E}_1$-ring, let $S \subseteq \pi_* R$ be a set of homogeneous elements of $\pi_* R$ which satisfy the left Ore condition, and let M be a left R-module. Then:*

(1) *Every element $x \in \pi_n S^{-1} M$ has the form $\psi_{d,n}(s, y)$ for some $s \in S_d$ and $y \in \pi_{n+d} M$. Here we employ the notation of Construction 7.2.3.19.*

(2) *Suppose we are given elements $s \in S_d$, $s' \in S_{d'}$, $y \in \pi_{n+d} M$ and $y' \in \pi_{n+d'} M$. Then $\psi_{d,n}(s, y) = \psi_{d',n}(s', y')$ if and only if there exist an integer m and homogeneous elements $z \in \pi_{m-d} R$, $z' \in \pi_{m-d'} R$ such that $zs = z's' \in S_m$ and $zy = z'y' \in \pi_{n+m} M$.*

小红书
小红书号:3189205503 qq

Proof. We have a fiber sequence

$$M \xrightarrow{\beta} S^{-1}M \xrightarrow{\alpha} M',$$

where M' is S-nilpotent. Let $x \in \pi_n S^{-1}M$. Since M' is S-nilpotent, there exists an element $s \in S_d$ such that $\alpha(sx) = s\alpha(x) = 0 \in \pi_{n+d}M'$. It follows that $sx = \beta(y)$ for some $y \in \pi_{n+d}M$: that is, $x = \psi_{d,n}(s, y)$. This proves (1).

We now prove (2). The "if" direction is obvious. For the converse, suppose that $\psi_{d,n}(s, y) = x = \psi_{d',n}(s', y')$. Since S satisfies the left Ore condition, we can choose homogeneous elements $u \in S_{k-d}$, $v \in \pi_{k-d'}R$ such that $us = vs'$. Then

$$\beta(uy) = u\beta(y) = u(sx) = (us)x = (vs')x = v(s'x) = v\beta(y') = \beta(vy'),$$

so that $uy - vy' \in \pi_{n+k}M$ is annihilated by β. It follows that $uy - vy'$ is the image of an element $\xi \in \pi_{n+k+1}M'$. Since M' is S-nilpotent, we can choose an element $t \in S_{k'}$ such that $t\xi = 0$, so that $tuy = tvy'$. Set $m = k + k'$, $z = tu$, and $z' = tu'$. Then $z \in S_{m-d}$ so that $zs \in S_m$, and $zs = z's'$ since $us = vs'$. We have $zy = tuy = tvy' = z'y'$, thereby completing the proof of (2). □

Proof of Parts (1), (2), *and* (3) *of Proposition 7.2.3.5.* Let R be an associative ring, let M be a (discrete) left R-module, and let $S \subseteq R$ be a subset which satisfies the left Ore condition. Let X denote the quotient of $S \times M$ by the equivalence relation of Definition 7.2.3.4; for $(s, x) \in S \times M$, we will denote the image of (s, x) in X by $s^{-1}x$. Let $S^{-1}M$ denote the S-localization of M as an R-module spectrum. Proposition 7.2.3.20 implies that $S^{-1}M$ is discrete; we will abuse notation by identifying $S^{-1}M$ with the ordinary R-module $\pi_0(S^{-1}M)$. Proposition 7.2.3.20 also determines a bijection of sets $\psi : X \to S^{-1}M$, given by the formula $s^{-1}x \mapsto \psi_{0,0}(s, x)$. This proves the existence assertion of (1). Assertions (2) follows from the fact that $S^{-1}M$ is S-local, and assertion (3) from the fact $S^{-1}M$ is the S-localization of M.

To complete the proof, it suffices to prove the uniqueness of the R-module structure on X constructed above. Suppose we are given some other left R-module structure on X satisfying the following conditions:

(a) The canonical map $\phi : M \to S^{-1}M$ is an R-module homomorphism.

(b) For every pair of elements $s \in S$, $x \in M$, we have $\phi(x) = s(s^{-1}x)$.

We claim that X is S-local (when regarded as a discrete R-module spectrum): in other words, we claim that for $s \in S$, the left multiplication map $X \xrightarrow{s} X$ is invertible. We first show that this map is injective. Suppose that $s(t^{-1}x) = 0$ for some element $t^{-1}x \in S$. Since S satisfies the left Ore condition, we can choose elements $u \in S$, $a \in R$ such that $as = ut$. Then

$$0 = a(s(t^{-1}x)) = (as)(t^{-1}x) = (ut)(t^{-1}x) = u(t(t^{-1}x)) = u\phi(x) = \phi(ux),$$

so there exists $v \in S$ such that $v(ux) = (vu)x$ vanishes. This immediately implies that $t^{-1}x = 0$ in X.

小红书
小红书号:3189205503 qq

We now claim that left multiplication by s is surjective. To prove this, let $t^{-1}x$ be an element of X. We claim that $t^{-1}x = s((ts)^{-1}x)$. Since multiplication by t is injective, it suffices to show that $t(t^{-1}x) = (ts)((ts)^{-1}x)$. It follows from (b) that both sides are given by $\phi(x)$. This completes the proof that X is S-local. It follows that ϕ admits a unique factorization

$$M \xrightarrow{u} S^{-1}M \xrightarrow{\theta} X,$$

where u denotes the canonical map from M to its S-localization. To complete the proof, it will suffice to show that the map θ is inverse to the bijection of sets $\psi : X \to S^{-1}M$ constructed above. We will show that $\theta \circ \psi = \mathrm{id}_X$ (since ψ is bijective, it follows that $\psi \circ \theta$ is the identity map on $S^{-1}M$). By construction, $\psi(s^{-1}x)$ is the unique element of $S^{-1}M$ satisfying $s\psi(s^{-1}x) = \phi(x)$. It follows that $s(\theta \circ \psi)(s^{-1}x) = \phi(x) = s(s^{-1}x)$. Since multiplication by s is injective on X, we conclude that $(\theta \circ \psi)(s^{-1}x) = s^{-1}x$. □

Remark 7.2.3.21. The proof given above shows that the notation $S^{-1}M$ introduced in Construction 7.2.3.4 (where M is a discrete module over an associative ring) is compatible with our notation for S-localizations introduced in Remark 7.2.3.18.

Definition 7.2.3.22. Let R be an $\mathbb{E}_1$-ring and let $S \subseteq \pi_* R$ be a set of homogeneous elements which satisfies the left Ore condition. We will say that a left R-module M is *S-complete* if $\mathrm{Ext}^i_R(N, M) \simeq 0$ for every S-local left R-module N. We let $\mathrm{LMod}_R^{\mathrm{Cpl}(S)}$ denote the full subcategory of LMod_R spanned by the S-complete R-modules.

Proposition 7.2.3.23. *Let R be an $\mathbb{E}_1$-ring and let $S \subseteq \pi_* R$ be a set of homogeneous elements which satisfies the left Ore condition. Then:*

(1) *The ∞-category $\mathrm{LMod}_R^{\mathrm{Cpl}(S)}$ is a stable subcategory of LMod_R.*

(2) *The inclusion $\mathrm{LMod}_R^{\mathrm{Cpl}(S)} \to \mathrm{LMod}_R$ admits a left adjoint F.*

(3) *For every $M \in \mathrm{LMod}_R$, there exists a fiber sequence*

$$M' \to M \to M''$$

where M' is S-local and M'' is S-complete.

(4) *The pair of subcategories $(\mathrm{LMod}_R^{\mathrm{Loc}(S)}, \mathrm{LMod}_R^{\mathrm{Cpl}(S)})$ is a t-structure on LMod_R (with trivial heart).*

(5) *The functor F induces an equivalence of ∞-categories $\mathrm{LMod}_R^{S-nil} \to \mathrm{LMod}_R^{\mathrm{Cpl}(S)}$.*

Proof. Assertion (1) is obvious. Note that Proposition 7.2.3.17 implies that $\mathrm{LMod}_R^{\mathrm{Loc}(S)}$ is a presentable ∞-category which is closed under small colimits in LMod_R. It follows from Corollary

小红书
小红书号:3189205503 qq

HTT.5.5.2.9 that the full subcategory inclusion $\phi : \mathrm{LMod}_R^{\mathrm{Loc}(S)} \to \mathrm{LMod}_R$ admits a right adjoint ψ. For every object $M \in \mathrm{LMod}_R$, the counit map $v : \psi M \to M$ induces an isomorphism $\mathrm{Ext}_R^*(N, \psi M) \to \mathrm{Ext}_R^*(N, M)$ for every S-local object N. It follows that the cofiber of v is S-complete, which proves (3). Assertions (2) and (4) follow immediately from (3).

We now prove (5). Let F denote a left adjoint to the inclusion $\mathrm{LMod}_R^{\mathrm{Cpl}(S)} \to \mathrm{LMod}_R$ and let G denote a right adjoint to the inclusion $\mathrm{LMod}_R^{S-nil} \to \mathrm{LMod}_R$. We will abuse notation by identifying F and G with their restrictions to LMod_R^{S-nil} and $\mathrm{LMod}_R^{\mathrm{Cpl}(S)}$, respectively. It follows that we have an adjunction

$$\mathrm{LMod}_R^{S-nil} \underset{G}{\overset{F}{\rightleftarrows}} \mathrm{LMod}_R^{\mathrm{Cpl}(S)}.$$

We claim that this adjunction exhibits the functors F and G as homotopy inverse. We first show that the unit map $u : \mathrm{id} \to G \circ F$ is an equivalence. Let $M \in \mathrm{LMod}_R^{S-nil}$, so that we have a fiber sequence

$$\psi(M) \to M \to F(M).$$

We wish to show that the map $M \to (G \circ F)(M)$ is an equivalence. Since $M \simeq G(M)$, it will suffice to show that $G(\psi(M)) \simeq 0$. This is clear, since $\psi(M)$ is S-local. To prove that the counit map $F \circ G \to \mathrm{id}$ is an equivalence, consider an arbitrary S-complete object $N \in \mathrm{LMod}_R$. We have a fiber sequence

$$G(N) \to N \to S^{-1}N.$$

Since N is S-complete, we have $N \simeq F(N)$. Consequently, to prove that the unit map $(F \circ G)(N) \to N$ is an equivalence, it will suffice to show that $F(S^{-1}N) \simeq 0$, which follows immediately from the observation that $S^{-1}N$ is S-local. □

In the case where R is connective, the subcategories of LMod_R defined above interact nicely with the t-structure on LMod_R.

Proposition 7.2.3.24. *Let R be a connective $\mathbb{E}_\infty$-ring and let $S \subseteq \pi_* R$ be a set of homogeneous elements which satisfies the left Ore condition. Then:*

(1) *Let M be an S-nilpotent R-module. Then the truncations $\tau_{\geq n} M$ and $\tau_{\leq n} M$ are S-nilpotent for every integer n. It follows that the t-structure on LMod_R determines an accessible t-structure*

$$(\mathrm{LMod}_R^{S-nil} \cap (\mathrm{LMod}_R)_{\geq 0}, \mathrm{LMod}_R^{S-nil} \cap (\mathrm{LMod}_R)_{\leq 0})$$

on LMod_R^{S-nil}, which is both right and left complete.

(2) *Let $G : \mathrm{LMod}_R \to \mathrm{LMod}_R^{S-nil}$ be a right adjoint to the inclusion. Then G is left t-exact.*

(3) *The localization functor $M \mapsto S^{-1}M$ is left t-exact (when regarded as a functor from LMod_R to itself).*

小红书
小红书号:3189205503 qq

Proof. Assertion (1) is immediate from the definition. Since the inclusion functor $\mathrm{LMod}_R^{S-nil} \to \mathrm{LMod}_R$ is left t-exact, its right adjoint is left t-exact; this proves (2). Assertion (3) follows easily from Proposition 7.2.3.20. □

If we are localizing with respect to a collection of elements S of degree zero in $\pi_* R$, we can be more precise.

Proposition 7.2.3.25. *Let R be a connective $\mathbb{E}_1$-ring and let $S \subseteq \pi_0 R$ be a subset which satisfies the left Ore condition as a subset of $\pi_* R$. Then:*

(1) *Let M be an R-module. Then M is S-complete if and only if each homotopy group $\pi_n M$ is S-complete, when regarded as a discrete R-module. It follows that the t-structure on LMod_R determines an accessible t-structure $(\mathrm{LMod}_R^{\mathrm{Loc}(S)} \cap (\mathrm{LMod}_R)_{\geq 0}, \mathrm{LMod}_R^{\mathrm{Loc}(S)} \cap (\mathrm{LMod}_R)_{\leq 0})$ on $\mathrm{LMod}_R^{\mathrm{Loc}(S)}$, which is both right and left complete.*

(2) *The localization functor $M \mapsto S^{-1}M$ is t-exact (when regarded as a functor from LMod_R to itself).*

Proof. Assertion (1) follows immediately from the definitions, and assertion (2) is a consequence of Proposition 7.2.3.20. □

Let R be an $\mathbb{E}_1$-ring and let $S \subseteq \pi_* R$ be a set of homogeneous elements which satisfies the left Ore condition. Since the inclusion $\mathrm{LMod}_R^{\mathrm{Loc}(S)} \to \mathrm{LMod}_R$ preserves filtered colimits, the left adjoint functor $M \mapsto S^{-1}M$ carries compact objects of LMod_R to compact objects of $\mathrm{LMod}_R^{\mathrm{Loc}(S)}$ (Proposition HTT.5.5.7.2). In particular, $S^{-1}R$ is a compact object of $\mathrm{LMod}_R^{\mathrm{Loc}(S)}$. For any S-local left R-module M, we have isomorphisms

$$\mathrm{Ext}_R^n(S^{-1}R, M) \simeq \mathrm{Ext}_R^n(R, M) \simeq \pi_{-n} M.$$

It follows that these groups vanish if and only if $M \simeq 0$, so that $S^{-1}R$ is a compact generator for the stable ∞-category $\mathrm{LMod}_R^{\mathrm{Loc}(S)}$. Let $R[S^{-1}]$ denote the $\mathbb{E}_1$-ring classifying endomorphisms of $S^{-1}R$ in $\mathrm{LMod}_R^{\mathrm{Loc}(S)}$. Using Theorem 7.1.2.1 (and Remark 7.1.2.3), we obtain an equivalence of stable ∞-categories $\mathrm{LMod}_R^{\mathrm{Loc}(S)} \simeq \mathrm{LMod}_{R[S^{-1}]}$ carrying $S^{-1}R$ to $R[S^{-1}]$. Composing this with the localization functor $M \mapsto S^{-1}M$, we obtain a colimit-preserving functor

$$\Phi : \mathrm{LMod}_R \to \mathrm{LMod}_{R[S^{-1}]}$$

carrying R to $R[S^{-1}]$. Using Theorem 4.8.5.5, we see that Φ is induced by a map of $\mathbb{E}_1$-rings $\phi : R \to R[S^{-1}]$, which is well-defined up to a contractible space of choices.

Remark 7.2.3.26. We can summarize the above discussion more informally as follows: if R is an $\mathbb{E}_1$-ring and $S \subseteq \pi_* R$ is a set of homogeneous elements satisfying the left Ore condition, then the spectrum $S^{-1}R$ admits the structure of an $\mathbb{E}_1$-ring, and the left R-module structure on $S^{-1}R$ arises from a map of $\mathbb{E}_1$-rings.

小红书
小红书号:3189205503 qq

Proposition 7.2.3.27. *Let R be an $\mathbb{E}_1$-ring, let $S \subseteq \pi_* R$ be a set of homogeneous elements satisfying the left Ore condition, and let $\phi : R \to R[S^{-1}]$ be defined as above. If A is any $\mathbb{E}_1$-ring, then composition with ϕ induces a fully faithful map of Kan complexes $\theta : \mathrm{Map}_{\mathrm{Alg}^{(1)}}(R[S^{-1}], A) \to \mathrm{Map}_{\mathrm{Alg}^{(1)}}(R, A)$, whose essential image is the collection of $\mathbb{E}_1$-rings $\psi : R \to A$ such that $\psi(s)$ is invertible in $\pi_* A$, for each $s \in S$.*

Proof. Let $F : \mathrm{LMod}_R \to \mathrm{LMod}_R^{\mathrm{Loc}(S)}$ be a left adjoint to the inclusion, given by $M \mapsto S^{-1}M$. Since F is a localization functor, composition with F induces a fully faithful embedding $\mathrm{LFun}(\mathrm{LMod}_R^{\mathrm{Loc}(S)}, \mathrm{LMod}_A) \to \mathrm{LFun}(\mathrm{LMod}_R, \mathrm{LMod}_A)$, where $\mathrm{LFun}(\mathrm{LMod}_R, \mathrm{LMod}_A)$ denotes the full subcategory of $\mathrm{Fun}(\mathrm{LMod}_R, \mathrm{LMod}_A)$ spanned by those functors which preserve small colimits, and $\mathrm{LFun}(\mathrm{LMod}_R^{\mathrm{Loc}(S)}, \mathrm{LMod}_A)$ is defined similarly.

Using Theorem 4.8.5.5 and the equivalence $\mathrm{LMod}_{R[S^{-1}]} \simeq \mathrm{LMod}_R^{\mathrm{Loc}(S)}$, we deduce immediately that θ is fully faithful. Moreover, a map of $\mathbb{E}_1$-rings $\psi : R \to A$ belongs to the essential image of θ if and only if it satisfies the following condition:

($*$) For every map of left R-modules $M \to M'$ which induces an equivalence $S^{-1}M \to S^{-1}M'$, the induced map $A \otimes_R M \to A \otimes_R M'$ is an equivalence.

Passing to fibers, we can reformulate condition ($*$) as follows:

($*'$) For every S-nilpotent R-module M, we have $A \otimes_R M \simeq 0$.

Since the collection of S-nilpotent R-modules M is generated under colimits by R-modules of the form $(R/Rs)[n]$ where $s \in S$ is a homogeneous element of degree d (Lemma 7.2.3.13), it suffices to verify condition ($*'$) in the case $M = R/Rs$. In this case, $A \otimes_R M$ is the cofiber of the map $A[d] \xrightarrow{s} A$ given by multiplication by s, so that $A \otimes_R M \simeq 0$ if and only if $\psi(s) \in \pi_d A$ is invertible in $\pi_* A$. □

Using Proposition 7.2.3.27, we can easily recover the classical theory of left rings of fractions:

Proof of Assertions (4), (5), *and* (6) *of Proposition 7.2.3.5.* Let R be an associative ring and let $S \subseteq R$ satisfy the left Ore condition. Let X denote the quotient of $S \times M$ by the equivalence relation of Definition 7.2.3.4; for $(s, x) \in S \times M$, we will denote the image of (s, x) in X by $s^{-1}x$. Let $\phi_0 : R \to X$ be the map given by $\phi_0(x) = 1^{-1}x$, and let $\phi : R \to R[S^{-1}]$ be the $\mathbb{E}_1$-rings appearing in Proposition 7.2.3.27. Proposition 7.2.3.20 implies that $R[S^{-1}]$ is discrete; we will abuse notation and identify $R[S^{-1}]$ with the ordinary associative ring $\pi_0 R[S^{-1}]$. Proposition 7.2.3.20 also determines a bijection of sets $\psi : X \to R[S^{-1}]$, which is characterized by the requirement that $\phi(s)\psi(s^{-1}x) = \phi(x)$ for all $s \in S$, $x \in R$. Taking $s = 1$, we deduce that $\phi = \psi \circ \phi_0$. There is a unique associative ring structure on X so that ψ is an isomorphism of rings, so that $\phi_0 : R \to X$ is a ring homomorphism satisfying $\phi_0(s)(s^{-1}x) = \phi_0(x)$. This proves the existence clause of (4).

Let us regard X as a left R-module via the map ϕ_0. This left R-module structure must coincide with the left R-module structure of part (1), so that (2) implies that multiplication by $\phi_0(s)$ induces

小红书
小红书号:3189205503 qq

a bijection $X \to X$ for each $s \in S$. It follows that ϕ_0 carries each element of S to an invertible element in X, which proves (5). Assertion (6) follows immediately from Proposition 7.2.3.27.

It remains only to prove the uniqueness clause of (4). Suppose that X is endowed with an arbitrary associative ring structure such that ϕ_0 is a ring homomorphism satisfying $\phi_0(s)(s^{-1}x) = \phi_0(x)$ for $s \in S$ and $x \in R$. Then the induced left R-module structure on X must coincide with the left R-module structure appearing in assertion (1), so that assertion (2) implies that left multiplication by $\phi_0(s)$ induces a bijection from X to itself for each $s \in S$. In other words, ϕ_0 carries each element of S to an invertible element of X, so that Proposition 7.2.3.27 gives a unique ring homomorphism $\theta : R[S^{-1}] \to X$ satisfying $\theta \circ \phi = \phi_0$. We will complete the proof by showing that θ is an inverse of the bijection $\psi : X \to R[S^{-1}]$, so that $\psi = \theta^{-1}$ is also a ring isomorphism. For this, we compute

$$\phi_0(s)(\theta \circ \psi)(s^{-1}x) = (\theta \circ \phi)(s)(\theta \circ \psi)(s^{-1}x) = \theta(\phi(s)\psi(s^{-1}x)) = (\theta \circ \phi)(x) = \phi_0(x) = \phi_0(s)(s^{-1}x).$$

Since $\phi_0(s)$ is an invertible element of X, we conclude that $(\theta \circ \psi)(s^{-1}x) = s^{-1}x$ for every element $s^{-1}x \in X$, as desired. □

7.2.4 Finiteness Properties of Rings and Modules

In this section, we will discuss some finiteness conditions on the ∞-categories of modules over an $\mathbb{E}_1$-ring R. We begin by introducing the definition of a *perfect* R-module. Roughly speaking, an R-module M is perfect if it can be obtained as a successive extension of finitely many (possibly shifted) copies of R, or is a retract of such an R-module. Alternatively, we can describe the class of perfect R-modules as the compact objects of the ∞-category LMod_R (Proposition 7.2.4.2).

In general, the condition that an R-module be perfect is very strong. For example, if R is a discrete commutative ring and M is a finitely generated (discrete) module over R, then M need not be perfect when viewed as an object of the stable ∞-category LMod_R (though this is true if R is a regular Noetherian ring of finite Krull dimension). To remedy the situation, we will introduce the weaker notion of an *almost perfect* R-module. This notion has a closer relationship with finiteness conditions in the classical theory of rings and modules. For example, we will show that under some mild assumptions on R, a left R-module M is almost perfect if and only if each homotopy group $\pi_i M$ is a finitely presented left module over $\pi_0 R$, and $\pi_i M \simeq 0$ for $i \ll 0$ (Proposition 7.2.4.17), at least when R itself satisfies a suitable finiteness condition (that is, when R is *left coherent* in the sense of Definition 7.2.4.13).

Definition 7.2.4.1. Let R be an $\mathbb{E}_1$-ring. We let $\mathrm{LMod}_R^{\mathrm{perf}}$ denote the smallest stable subcategory of LMod_R which contains R (regarded as a left module over itself) and is closed under retracts. Similarly, we let $\mathrm{RMod}_R^{\mathrm{perf}}$ denote the smallest stable subcategory of RMod_R which contains R and is closed under retracts. We will say that a left (right) R-module M is *perfect* if it belongs to $\mathrm{LMod}_R^{\mathrm{perf}}$ ($\mathrm{RMod}_R^{\mathrm{perf}}$).

小红书号:3189205503 qq

Proposition 7.2.4.2. *Let R be an $\mathbb{E}_1$-ring. Then:*

(1) *The ∞-category LMod_R is compactly generated.*

(2) *An object of LMod_R is compact if and only if it is perfect.*

Proof. The compact objects of LMod_R form a stable subcategory which is closed under the formation of retracts. Moreover, Corollary 4.2.4.8 implies $R \in \mathrm{LMod}_R$ corepresents the functor given by the composition

$$\mathrm{LMod}_R = \mathrm{LMod}_R(\mathrm{Sp}) \longrightarrow \mathrm{Sp} \xrightarrow{\Omega^\infty} \mathcal{S}$$

of two functors which each preserve filtered colimits. It follows that R is compact as a left R-module, from which it immediately follows that all perfect objects of LMod_R are compact.

According to Proposition HTT.5.3.5.11 , the inclusion $f : \mathrm{LMod}_R^{\mathrm{perf}} \subseteq \mathrm{LMod}_R$ induces a fully faithful functor $F : \mathrm{Ind}(\mathrm{LMod}_R^{\mathrm{perf}}) \to \mathrm{LMod}_R$. To complete the proof, it will suffice to show that F is essentially surjective. Since f is right exact, F preserves all colimits (Proposition HTT.5.5.1.9), so the essential image of F is stable under colimits. If F is not essentially surjective, then Proposition 1.4.4.11 implies that there exists a nonzero $N \in \mathrm{LMod}_R$ such that $\mathrm{Map}_{\mathrm{LMod}_R}(N', N) \simeq *$ for all N' belonging to the essential image of F. In particular, taking $N' = R[n]$, we conclude that $\pi_n N \simeq *$. It follows that N is a zero object of LMod_R, contrary to our assumption. □

Let R be an $\mathbb{E}_1$-ring. It follows from Remark 4.8.4.8 that the the ∞-categories LMod_R and RMod_R are duals of one another (in the symmetric monoidal ∞-category of presentable stable ∞-categories). In this special case, it is easy to verify the duality directly:

Proposition 7.2.4.3. *Let R be an $\mathbb{E}_1$-ring. The relative tensor product functor*

$$\otimes_R : \mathrm{RMod}_R \times \mathrm{LMod}_R \to \mathrm{Sp}$$

induces fully faithful embeddings

$$\theta : \mathrm{RMod}_R \to \mathrm{Fun}(\mathrm{LMod}_R, \mathrm{Sp}) \quad \theta' : \mathrm{LMod}_R \to \mathrm{Fun}(\mathrm{RMod}_R, \mathrm{Sp}).$$

A functor $f : \mathrm{LMod}_R \to \mathrm{Sp}$ ($g : \mathrm{RMod}_R \to \mathrm{Sp}$) belongs to the essential image of θ (θ') if and only if f (g) preserves small colimits.

Proof. Let $\mathcal{C}$ be the full subcategory of $\mathrm{Fun}(\mathrm{LMod}_R, \mathrm{Sp})$ spanned by those functors which preserve small colimits. Proposition HTT.5.5.3.8 implies that $\mathcal{C}$ is presentable, and Proposition 4.4.2.14 implies that θ factors through $\mathcal{C}$. We will show that θ induces an equivalence $G : \mathrm{RMod}_R \to \mathcal{C}$; the analogous assertion for left modules follows by the same argument.

Proposition 7.2.4.2 implies that LMod_R is equivalent to the ∞-category $\mathrm{Ind}(\mathrm{LMod}_R^{\mathrm{perf}})$. It follows from Propositions HTT.4.2.3.11 , HTT.5.5.1.9 and 1.1.4.1 that $\mathcal{C}$ is equivalent to the ∞-category $\mathrm{Fun}^{\mathrm{Ex}}(\mathrm{LMod}_R^{\mathrm{perf}}, \mathrm{Sp})$ of exact functors from $\mathrm{LMod}_R^{\mathrm{perf}}$ to spectra. In particular, for every

小红书
小红书号:3189205503 qq

perfect left R-module N, evaluation on N induces a functor $\mathcal{C} \to \mathrm{Sp}$ that preserves all small limits and colimits.

Let $G' : \mathcal{C} \to \mathrm{Sp}$ be given by evaluation on R, regarded as a (perfect) left module over itself. If $\alpha : f \to f'$ is a natural transformation of functors from $\mathrm{LMod}_R^{\mathrm{perf}}$ to Sp, then the full subcategory of $\mathrm{hLMod}_R^{\mathrm{perf}}$ spanned by objects C such that $\alpha(C) : f(C) \to f'(C)$ is an equivalence is a triangulated subcategory of $\mathrm{hLMod}_R^{\mathrm{perf}}$ which is stable under retracts. If follows that G' is *conservative*: if $G'(\alpha)$ is an equivalence, then α is an equivalence. Since G' preserves small limits, we deduce also that G' detects small limits: if $\overline{p} : K^{\triangleleft} \to \mathcal{C}$ is such that $G' \circ \overline{p}$ is a limit diagram in Sp, then $\overline{p}$ is a limit diagram in $\mathcal{C}$. Similarly, G' detects small colimits.

The composite functor $G' \circ G : \mathrm{RMod}_R \to \mathrm{Sp}$ can be identified with the forgetful functor, in view of Corollary 4.2.4.8. It follows that $G' \circ G$ preserves all limits and colimits (Corollaries 4.2.3.3 and 4.2.3.5). Since G' detects small limits and colimits, we deduce that G preserves small limits and colimits. Corollary HTT.5.5.2.9 implies that G and G' admit left adjoints, which we will denote by F and F'.

Choose unit and counit transformations

$$u : \mathrm{id} \to G \circ F, \quad v : F \circ G \to \mathrm{id}\,.$$

We wish to prove that u and v are equivalences. Since $G' \circ G$ detects equivalences, the functor G detects equivalences, so that v is an equivalence if and only if $G(v) : G \circ F \circ G \to G$ is an equivalence. Since $G(v)$ has a section determined by u, it will suffice to prove that u is an equivalence.

Let $\mathcal{C}'$ be the full subcategory of $\mathcal{C}$ spanned by those objects $f \in \mathcal{C}$ for which the map $u(f) : f \to (G \circ F)(f)$ is an equivalence. Since G and F preserve small colimits, we deduce that $\mathcal{C}'$ is stable under shifts and colimits in $\mathcal{C}$. Proposition 4.7.3.14 implies that $\mathcal{C}$ is generated, under geometric realizations, by the essential image of F'. Let $\mathrm{Sp}' \subseteq \mathrm{Sp}$ be the inverse image of $\mathcal{C}'$ under F'. Since F' is a colimit-preserving functor, we deduce that $\mathrm{Sp}' \subseteq \mathrm{Sp}$ is closed under shifts and colimits. Since Sp is generated under colimits by the objects $S[n]$, where $n \in \mathbf{Z}$ and $S \in \mathrm{Sp}$ denotes the sphere spectrum, it will suffice to show that $S \in \mathrm{Sp}'$.

Corollary 4.2.4.8 allows us to identify $(F \circ F')(S)$ with $R \otimes S \simeq R$, regarded as a left module over itself. It follows that $(G \circ F)(F'(S))$ can be identified with the forgetful functor $f_0 : \mathrm{LMod}_R \to \mathrm{Sp}$. We are reduced to proving that the unit map $S \to R \simeq f_0(R)$ induces an equivalence $F'(S) \simeq f_0$ in $\mathcal{C}$.

Applying Proposition 1.4.2.22, we can identify $\mathcal{C}$ with the full subcategory $\mathcal{D} \subseteq \mathrm{Fun}(\mathrm{LMod}_R^{\mathrm{perf}}, \mathcal{S}) = \mathcal{P}(\mathrm{LMod}_R^{\mathrm{perf,op}})$ spanned by those functors which preserve finite limits. Under this equivalence, f_0 corresponds to the composition $\mathrm{LMod}_R^{\mathrm{perf}} \subseteq \mathrm{LMod}_R \to \mathrm{Sp} \xrightarrow{\Omega^\infty} \mathcal{S}$, while $F'(S)$ corresponds to the image of $* \in \mathcal{S}$ under the composition $\mathcal{S} \xrightarrow{\Sigma^\infty} \mathrm{Sp} \xrightarrow{F'} \mathcal{C} \simeq \mathcal{D}$ which is the left adjoint to the the functor $\mathcal{D} \to \mathcal{S}$ given by evaluation at $R \in \mathrm{LMod}_R^{\mathrm{perf}}$. To complete the proof, it will suffice to show that the unit $1 \in \pi_0 R$ exhibits the composite functor $\mathrm{LMod}_R \to \mathrm{Sp} \xrightarrow{\Omega^\infty} \mathcal{S}$ as corepresented by $R \in \mathrm{LMod}_R$. In other words, we must show that for every $M \in \mathrm{LMod}_R$, the canonical map

小红书
小红书号:3189205503 qq

$\mathrm{Map}_{\mathrm{LMod}_R}(R, M) \to \Omega^\infty M$ is a homotopy equivalence. Using Corollary 4.2.4.8, we can reduce to the case where R is the unit object of $S \in \mathrm{Alg}(\mathrm{Sp})$. We are therefore reduced to proving that if $M \in \mathrm{Sp}$, then the canonical map $\mathrm{Map}_{\mathrm{Sp}}(S, M) \to \Omega^\infty M$ is an equivalence, which is clear. □

Proposition 7.2.4.4. *Let R be an $\mathbb{E}_1$-ring, and let M be a left R-module. The following conditions are equivalent:*

(1) *The left R-module M is perfect.*

(2) *The left R-module M is a compact object of LMod_R.*

(3) *There exists a right R-module $M^\vee$ such that the composition $\mathrm{LMod}_R \xrightarrow{M^\vee \otimes_R \bullet} \mathrm{Sp} \xrightarrow{\Omega^\infty} \mathcal{S}$ is equivalent to the functor corepresented by M.*

Moreover, if these conditions are satisfied, then the object $M^\vee \in \mathrm{RMod}_R$ is also perfect.

Proof. The equivalence (1) $\Leftrightarrow$ (2) is Proposition 7.2.4.2. Let $\mathcal{C}$ denote the full subcategory of $\mathrm{Fun}(\mathrm{LMod}_R, \mathrm{Sp})$ spanned by those functors which are continuous and exact. Proposition 7.2.4.3 yields an equivalence of ∞-categories $\mathrm{RMod}_R \to \mathcal{C}$. According to Propositions 1.4.2.22 and 1.4.4.4, composition with Ω^∞ induces a fully faithful embedding $\mathcal{C} \to \mathrm{Fun}(\mathrm{LMod}_R, \mathcal{S})$, whose essential image $\mathcal{C}'$ consists precisely of those functors which are continuous and left exact. The functor corepresented by M is automatically left-exact, and is continuous if and only if M is compact. This proves that (2) $\Leftrightarrow$ (3).

Let $j : (\mathrm{LMod}_R)^{\mathrm{op}} \to \mathrm{Fun}(\mathrm{LMod}_R, \mathcal{S})$ denote the dual Yoneda embedding, so that j restricts to a map $j' : (\mathrm{LMod}_R^{\mathrm{perf}})^{\mathrm{op}} \to \mathcal{C}'$. Composing j' with a homotopy inverse to the equivalence $\mathrm{RMod}_R \to \mathcal{C} \to \mathcal{C}'$, we obtain a "dualization" map $(\mathrm{LMod}_R^{\mathrm{perf}})^{\mathrm{op}} \to \mathrm{RMod}_R$, which we will indicate by $M \mapsto M^\vee$. Let $\mathcal{D} \subseteq \mathrm{LMod}_R^{\mathrm{perf}}$ be the full subcategory spanned by those objects M such that $M^\vee$ is perfect. We wish to show that $\mathcal{D} = \mathrm{LMod}_R^{\mathrm{perf}}$. The functor $M \mapsto M^\vee$ is exact, and $\mathrm{RMod}_R^{\mathrm{perf}}$ is a stable subcategory of RMod_R which is closed under retracts. It follows that $\mathcal{D}$ is a stable subcategory of LMod_R which is closed under retracts. Since $A^\vee \simeq A$ belongs to $\mathcal{D}$, we conclude that $\mathrm{LMod}_R^{\mathrm{perf}} \subseteq \mathcal{D}$. □

Corollary 7.2.4.5. *Let R be a connective $\mathbb{E}_1$-ring, and let M be a perfect left R-module. Then:*

(1) *The homotopy groups $\pi_m M$ vanish for $m \ll 0$.*

(2) *Suppose that $\pi_m M \simeq 0$ for all $m < k$. Then $\pi_k M$ is a finitely presented module over $\pi_0 A$.*

Proof. We have an equivalence $M \simeq \varinjlim(\tau_{\geq -n} M)$. Since M is compact (Proposition 7.2.4.2), we conclude that M is a retract of some $\tau_{\geq -n} M$, so that $\pi_m M \simeq 0$ for $m < -n$. This proves (1). To prove (2), we observe that the inclusion of the heart of LMod_R into $\mathrm{LMod}_R^{\mathrm{cn}}$ preserves filtered colimits, so the right adjoint $\tau_{\leq 0} : \mathrm{LMod}_R^{\mathrm{cn}} \to \mathrm{LMod}_R^{\heartsuit}$ preserves compact objects. It now suffices to observe that the compact objects in the ordinary category of $\pi_0 R$-modules are precisely the finitely presented modules. □

小红书
小红书号:3189205503 qq

In the situation of Proposition 7.2.4.4, we will refer to $M^\vee$ as a *dual* of M. We next prove that this notion of duality determines an antiequivalence between the ∞-categories $\mathrm{LMod}_R^{\mathrm{perf}}$ and $\mathrm{RMod}_R^{\mathrm{perf}}$.

Lemma 7.2.4.6. *Let $\mathcal{C}$ and $\mathcal{D}$ be ∞-categories, and let $F : \mathcal{C} \times \mathcal{D} \to \mathcal{S}$ be a bifunctor. The following conditions are equivalent:*

(1) *The induced map $f : \mathcal{C} \to \mathrm{Fun}(\mathcal{D}, \mathcal{S}) = \mathcal{P}(\mathcal{D}^{\mathrm{op}})$ is fully faithful, and the essential image of f coincides with the essential image of the Yoneda embedding $\mathcal{D}^{\mathrm{op}} \to \mathcal{P}(\mathcal{D}^{\mathrm{op}})$.*

(2) *The induced map $f' : \mathcal{D} \to \mathrm{Fun}(\mathcal{C}, \mathcal{S}) = \mathcal{P}(\mathcal{C}^{\mathrm{op}})$ is fully faithful, and the essential image of f coincides with the essential image of the Yoneda embedding $\mathcal{C}^{\mathrm{op}} \to \mathcal{P}(\mathcal{C}^{\mathrm{op}})$.*

Proof. Let

$$G_{\mathcal{C}} : \mathcal{C} \times \mathcal{C}^{\mathrm{op}} \to \mathcal{S}, \quad G_{\mathcal{D}} : \mathcal{D}^{\mathrm{op}} \times \mathcal{D} \to \mathcal{S}$$

be the maps used in the definition of the Yoneda embeddings (see §HTT.5.1.3). Then (1) is equivalent to the existence of an equivalence $\alpha : \mathcal{D}^{\mathrm{op}} \to \mathcal{C}$ such that the composition $\mathcal{D}^{\mathrm{op}} \times \mathcal{D} \longrightarrow \mathcal{C} \times \mathcal{D} \xrightarrow{F} \mathcal{S}$ is homotopic to $G_{\mathcal{D}}$. If β is a homotopy inverse to α, then the composition $\mathcal{C} \times \mathcal{C}^{\mathrm{op}} \xrightarrow{\beta^{\mathrm{op}}} \mathcal{C} \times \mathcal{D} \xrightarrow{F} \mathcal{S}$ is homotopic to $G_{\mathcal{C}}$, which proves (2). The converse follows by the same argument. □

We will say that a functor $F : \mathcal{C} \times \mathcal{D} \to \mathcal{S}$ is a *perfect pairing* if it satisfies the hypotheses of Lemma 7.2.4.6. In this case, F determines an equivalence between $\mathcal{C}$ and $\mathcal{D}^{\mathrm{op}}$, well-defined up to homotopy. The proof of Proposition 7.2.4.4 yields the following:

Proposition 7.2.4.7. *Let R be an $\mathbb{E}_1$-ring. Then the bifunctor*

$$\mathrm{RMod}_R^{\mathrm{perf}} \times \mathrm{LMod}_R^{\mathrm{perf}} \xrightarrow{\otimes_R} \mathrm{Sp} \xrightarrow{\Omega^\infty} \mathcal{S}$$

is a perfect pairing.

Let R be an $\mathbb{E}_1$-ring, and let M be a left R-module. Roughly speaking, M is perfect if it can built from finitely many copies of R (by forming shifts, extensions, and retracts). This is a very strong condition which is often violated in practice. For example, suppose that R is a commutative Noetherian ring and that M is a discrete R-module, such that $\pi_0 M$ is finitely generated over R in the sense of classical commutative algebra. In this case, we can choose a resolution

$$\ldots \to P_2 \to P_1 \to P_0 \to \pi_0 M$$

where each P_i is a free R-module of finite rank. However, we cannot usually guarantee that $P_n \simeq 0$ for $n \gg 0$; in general this is possible only when R is regular ([50]). Consequently, the module M is not generally perfect as an R-module spectrum (see Example 7.2.4.25 below). Nevertheless, the fact that we can choose each P_i to be of finite rank can be regarded as a weaker finiteness condition on M, which we now formulate.

小红书
小红书号:3189205503 qq

Definition 7.2.4.8. Let $\mathcal{C}$ be a compactly generated ∞-category. We will say that an object $C \in \mathcal{C}$ is *almost compact* if $\tau_{\leq n} C$ is a compact object of $\tau_{\leq n} \mathcal{C}$ for all $n \geq 0$.

Remark 7.2.4.9. Let $\mathcal{C}$ be a compactly generated ∞-category. Then every compact object of $\mathcal{C}$ is almost compact.

Definition 7.2.4.10. Let R be a connective $\mathbb{E}_1$-ring. We will say that a left R-module M is *almost perfect* if there exists an integer k such that $M \in (\mathrm{LMod}_R)_{\geq k}$ and is almost compact as an object of $(\mathrm{LMod}_R)_{\geq k}$. We let $\mathrm{LMod}_R^{\mathrm{aperf}}$ denote the full subcategory of LMod_R spanned by the almost perfect left R-modules.

Proposition 7.2.4.11. *Let R be a connective $\mathbb{E}_1$-ring. Then:*

(1) *The full subcategory $\mathrm{LMod}_R^{\mathrm{aperf}} \subseteq \mathrm{LMod}_R$ is closed under translations and finite colimits, and is therefore a stable subcategory of LMod_R.*

(2) *The full subcategory $\mathrm{LMod}_R^{\mathrm{aperf}} \subseteq \mathrm{LMod}_R$ is closed under the formation of retracts.*

(3) *Every perfect left R-module is almost perfect.*

(4) *The full subcategory $(\mathrm{LMod}_R^{\mathrm{aperf}})_{\geq 0} \subseteq \mathrm{LMod}_R$ is closed under the formation of geometric realizations of simplicial objects.*

(5) *Let M be a left R-module which is connective and almost perfect. Then M can be obtained as the geometric realization of a simplicial left R-module $P_\bullet$ such that each P_n is a free R-module of finite rank.*

Proof. Assertions (1) and (2) are obvious, and (3) follows from Proposition 7.2.4.2 and Corollary 7.2.4.5. To prove (4), it suffices to show that the collection of compact objects of $\tau_{\leq n} \mathrm{LMod}_R^{\mathrm{cn}}$ is closed under geometric realizations, which follows from Lemma 1.3.3.10.

We now prove (5). In view of Theorem 1.2.4.1 and Remark 1.2.4.3, it will suffice to show that M can be obtained as the colimit of a sequence

$$D(0) \xrightarrow{f_1} D(1) \xrightarrow{f_2} D(2) \to \ldots$$

where each $\mathrm{cofib}(f_n)[-n]$ is a free R-module of finite rank; here we agree by convention that f_0 denotes the zero map $0 \to D(0)$. The construction goes by induction. Suppose that the diagram

$$D(0) \to \ldots \to D(n) \xrightarrow{g} M$$

has already been constructed, and that $N = \mathrm{fib}(g)$ is n-connective. Part (1) implies that N is almost perfect, so that the bottom homotopy group $\pi_n N$ is a compact object in the category of left $\pi_0 A$-modules. It follows that there exists a map $\beta : Q[n] \to N$, where Q is a free left R-module

小红书
小红书号:3189205503 qq

of finite rank, and β induces a surjection $\pi_0 Q \to \pi_n N$. We now define $D(n+1)$ to be the cofiber of the composite map $Q(n) \xrightarrow{\beta} N \to D(n)$, and construct a diagram

$$D(0) \to \ldots \to D(n) \to D(n+1) \xrightarrow{g'} M.$$

Using the octahedral axiom, we obtain a fiber sequence

$$Q[n] \to \mathrm{fib}(g) \to \mathrm{fib}(g'),$$

and the associated long exact sequence of homotopy groups proves that $\mathrm{fib}(g')$ is $(n+1)$-connective.

In particular, we conclude that for fixed m, the maps $\pi_m D(n) \to \pi_m M$ are isomorphisms for $n \gg 0$, so that the natural map $\varinjlim D(n) \to M$ is an equivalence of left R-modules, as desired. □

Using Proposition 7.2.4.11, we can give the following characterization of the ∞-category of (connective) almost perfect modules over a connective $\mathbb{E}_1$-ring.

Corollary 7.2.4.12. *Let R be a connective $\mathbb{E}_1$-ring, let $\mathcal{C}$ denote the full subcategory of LMod_R spanned by those left A-modules which are connective and almost perfect, and let $\mathcal{C}^0 \subseteq \mathcal{C}$ denote the full subcategory of $\mathcal{C}$ spanned by the objects $\{R^n\}_{n \geq 0}$. Let $\mathcal{D}$ be an arbitrary ∞-category which admits geometric realizations for simplicial objects, and let $\mathrm{Fun}_\sigma(\mathcal{C}, \mathcal{D})$ be the full subcategory of $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$ spanned by those functors which preserve geometric realizations of simplicial objects. Then the restriction functor $\mathrm{Fun}_\sigma(\mathcal{C}, \mathcal{D}) \to \mathrm{Fun}(\mathcal{C}^0, \mathcal{D})$ is an equivalence of ∞-categories.*

Proof. Let $\mathcal{C}'$ be the smallest full subcategory of $\mathcal{P}(\mathcal{C}^0)$ which contains the essential image of the Yoneda embedding and is stable under geometric realizations of simplicial objects, and let $j : \mathcal{C}^0 \to \mathcal{C}'$ be the Yoneda embedding. Using Remark HTT.5.3.5.9 , we conclude that composition with j induces an equivalence $\mathrm{Fun}_\sigma(\mathcal{C}', \mathcal{D}) \to \mathrm{Fun}(\mathcal{C}^0, \mathcal{D})$ for any ∞-category $\mathcal{D}$ which admits geometric realizations of simplicial objects. In particular, the inclusion $\mathcal{C}^0 \subseteq \mathcal{C}$ extends (up to homotopy) to a functor $F : \mathcal{C}' \to \mathcal{C}$ which commutes with geometric realizations. To complete the proof, it will suffice to show that F is an equivalence of ∞-categories. Using the fact that each R^n is a projective object of $\mathrm{LMod}_R^{\mathrm{cn}}$, we deduce that F is fully faithful. Part (5) of Proposition 7.2.4.11 implies that F is essentially surjective. □

For a general connective $\mathbb{E}_1$-ring R, the t-structure on LMod_R does not restrict to a t-structure on the full subcategory $\mathrm{LMod}_R^{\mathrm{aperf}}$. One might naively expect the heart of $\mathrm{LMod}_R^{\mathrm{aperf}}$ to be equivalent to the ordinary category of finitely presented $\pi_0 R$-modules. In general, this is not an abelian category. We can correct this defect by introducing an appropriate hypothesis on R. We begin by recalling a definition from classical algebra.

Definition 7.2.4.13. An associative ring R is *left coherent* if every finitely generated left ideal of R is finitely presented (as a left R-module).

小红书
小红书号:3189205503 qq

Example 7.2.4.14. An associative ring R is *left Noetherian* if every left ideal in R is finitely generated. Every left Noetherian ring is left coherent. An infinitely generated polynomial ring $\mathbf{Z}[x_1, x_2, x_3, \ldots]$ is an example of a (left) coherent ring which is not (left) Noetherian.

For completeness, we include a proof of the following classical result:

Lemma 7.2.4.15. *Let R be a left coherent associative ring. Then:*

(1) *Every finitely generated submodule of R^n is finitely presented.*

(2) *Every finitely generated submodule of a finitely presented left R-module is finitely presented.*

(3) *If $f : M \to N$ is a map of finitely presented left R-modules, then* $\ker(f)$ *and* $\mathrm{coker}(f)$ *are finitely presented.*

Proof. We first make the following elementary observations, which do not require the assumption that R is left coherent:

(a) Suppose $f : M \to N$ is an epimorphism of left R-modules. If M is finitely generated and N is finitely presented, then $\ker(f)$ is finitely generated.

(b) Let $0 \to M' \to M \to M'' \to 0$ be a short exact sequence of left R-modules. If M' and M'' are finitely presented, then M is finitely presented.

We now prove (1) using induction on n. When $n = 0$ there is nothing to prove. Suppose that $n > 0$ and that $M \subseteq R^n$ is finitely generated. Form a diagram

$$\begin{array}{ccccccccc} 0 & \longrightarrow & M' & \longrightarrow & M & \longrightarrow & M'' & \longrightarrow & 0 \\ \downarrow & & \downarrow & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & R^{n-1} & \longrightarrow & R^n & \longrightarrow & R & \longrightarrow & 0 \end{array}$$

where the vertical maps are monomorphisms. Then M'' can be identified with a finitely generated left ideal of R. Since R is left coherent, we conclude that M'' is finitely presented. Using (a), we deduce that M' is itself finitely generated. The inductive hypothesis now implies that M' is finitely presented, so that we can use (b) to conclude that M is finitely presented.

We next prove (2). Suppose that $f : M \to N$ is a monomorphism, where N is finitely presented and M is finitely generated. Choose an epimorphism $g : R^n \to N$, and form a pullback diagram

$$\begin{array}{ccc} K & \longrightarrow & R^n \\ \downarrow & & \downarrow \\ M & \longrightarrow & N. \end{array}$$

Then K can be identified with the kernel of the induced map $R^n \to N/M$, and is therefore finitely generated. Part (1) implies that K is finitely presented. The induced map $K \to M$ is

小红书
小红书号:3189205503 qq

an epimorphism, whose kernel is isomorphic to $\ker(g)$ and is therefore finitely generated. It follows that M is finitely presented, as desired.

We now prove (3). It is clear that $\mathrm{coker}(f)$ is finitely presented (this does not require the left coherence of R). We next show that $\ker(f)$ is finitely presented. The image of f is a finitely generated submodule of N, and therefore finitely presented by (2). Consequently, we may replace N by $\mathrm{im}(f)$, and thereby reduce to the case where f is an epimorphism. We now apply (a) to deduce that $\ker(f)$ is finitely generated. Invoking (2) again, we conclude that $\ker(f)$ is finitely presented as desired. □

Definition 7.2.4.16. Let R be an $\mathbb{E}_1$-ring. We will say that R is *left coherent* if the following conditions are satisfied:

(1) The $\mathbb{E}_1$-ring R is connective.

(2) The associative ring $\pi_0 R$ is left coherent (in the sense of Definition 7.2.4.13).

(3) For each $n \geq 0$, the homotopy group $\pi_n R$ is finitely presented as a left module over $\pi_0 R$.

Proposition 7.2.4.17. *Let R be an $\mathbb{E}_1$-ring and M a left R-module. Suppose that R is left coherent. Then M is almost perfect if and only if the following conditions are satisfied:*

(i) For $m \ll 0$, $\pi_m M = 0$.

(ii) For every integer m, $\pi_m M$ is finitely presented as a $\pi_0 R$-module.

Proof. Without loss of generality, we may assume that M is connective. Suppose first that M is almost perfect. We will prove by induction on n that $\pi_n M$ is finitely presented as a $\pi_0 R$-module. If $n = 0$, this simply reduces to the observation that the compact objects of the ordinary category of left $\pi_0 R$-modules are precisely the finitely presented $\pi_0 R$-modules. In particular, we can choose a finitely generated free R-module P and a map $\alpha : P \to M$ which induces a surjection $\pi_0 P \to \pi_0 M$. Since R is left coherent, the homotopy groups $\pi_m P$ are finitely presented $\pi_0 R$-modules. Let $K = \mathrm{fib}(\alpha)$. Then K is connective by construction, and almost perfect by Proposition 7.2.4.11. The inductive hypothesis implies that $\pi_i K$ is finitely presented for $0 \leq i < n$.

We have a short exact sequence

$$0 \to \mathrm{coker}(\pi_n K \to \pi_n P) \to \pi_n M \to \ker(\pi_{n-1} K \to \pi_{n-1} P) \to 0.$$

Using Lemma 7.2.4.15, we deduce that the outer terms are finitely generated, so that $\pi_n M$ is finitely generated. Applying the same reasoning, we conclude that $\pi_n K$ is finitely generated, so that $\mathrm{coker}(\pi_n K \to \pi_n P)$ is finitely presented. Using the exact sequence again, we conclude that $\pi_n M$ is finitely presented.

Now suppose that the connective left R-module M satisfies condition (ii). We will prove that M can be obtained as the geometric realization of a simplicial left R-module $P_\bullet$ such that each P_n

小红书
小红书号:3189205503 qq

is a free A-module of finite rank. As in the proof of Proposition 7.2.4.11, it will suffice to show that M is the colimit of a sequence

$$D(0) \xrightarrow{f_1} D(1) \xrightarrow{f_2} D(2) \to \ldots$$

where each $\mathrm{cofib}(f_n)[-n]$ is a free R-module of finite rank. Supposing that the partial sequence

$$D(0) \to \ldots \to D(n) \xrightarrow{g} M$$

has been constructed, with the property that $\mathrm{fib}(g)$ is n-connective. If $\pi_n \mathrm{fib}(g)$ is finitely generated as a $\pi_0 R$-module, then we can proceed as in the proof of Proposition 7.2.4.11. To verify this, we observe that $D(n)$ is almost perfect and therefore satisfies (ii) (by the first part of the proof). We now use the exact sequence

$$0 \to \mathrm{coker}(\pi_{n+1} D(n) \to \pi_{n+1} M) \to \pi_n \mathrm{fib}(g) \to \ker(\pi_n D(n) \to \pi_n M) \to 0$$

to conclude that $\pi_n \mathrm{fib}(g)$ is finitely presented. □

Proposition 7.2.4.18. *Let R be a connective $\mathbb{E}_1$-ring. The following conditions are equivalent:*

(1) *The $\mathbb{E}_1$-ring R is left coherent.*

(2) *For every left R-module M, if M is almost perfect, then $\tau_{\geq 0} M$ is almost perfect.*

(3) *The pair of ∞-categories*

$$(\mathrm{LMod}_R^{\mathrm{aperf}} \cap \mathrm{LMod}_R^{\geq 0}, \mathrm{LMod}_R^{\mathrm{aperf}} \cap \mathrm{LMod}_R^{\leq 0})$$

determines a t-structure on $\mathrm{LMod}_R^{\mathrm{aperf}}$.

Proof. The implication (1) ⇒ (2) follows from the description of almost perfect modules given in Proposition 7.2.4.17. The equivalence (2) ⇔ (3) is obvious. We will show that (3) ⇒ (1).

Suppose that (3) is satisfied. We note that the first non-vanishing homotopy group of any almost perfect R-module is a finitely presented module over $\pi_0 R$. Applying (2) to the module $R[-n]$, we deduce that $\pi_n R$ is a finitely presented $\pi_0 R$-module. To complete the proof, it suffices to show that $\pi_0 R$ is left coherent.

Let $A = \pi_0 R$, and regard A as a discrete left R-module. Using condition (3), we deduce that A is almost perfect. Let $I \subseteq A$ be a finitely generated left ideal. Then I is the image of a map $f : A^n \to A$. Let K denote the fiber of f (in the ∞-category LMod_R). Then K is almost perfect. We have a short exact sequence

$$0 \to \pi_0 K \to A^n \to I \to 0.$$

Since K is almost perfect, condition (3) implies that $\pi_0 K$ is finitely generated as an A-module, so that I is finitely presented as a A-module. This completes the proof of (1). □

Remark 7.2.4.19. Let R be a left coherent $\mathbb{E}_1$-ring, and regard $\mathrm{LMod}_R^{\mathrm{aperf}}$ as endowed with the t-structure described in Proposition 7.2.4.18. Then $\mathrm{LMod}_R^{\mathrm{aperf}}$ is right bounded and left complete, and the functor $M \mapsto \pi_0 M$ determines an equivalence from the heart of $\mathrm{LMod}_R^{\mathrm{aperf}}$ to the (nerve of the) category of finitely presented left modules over $A = \pi_0 R$.

We now study the interaction between finiteness and flatness properties of modules.

Proposition 7.2.4.20. *Let R be a connective $\mathbb{E}_1$-ring, and let M be a connective left R-module. The following conditions are equivalent:*

(1) *The left R-module M is a retract of a finitely generated free R-module.*

(2) *The left R-module M is flat and almost perfect.*

Proof. The implication (1) $\Rightarrow$ (2) is obvious. Conversely, suppose that M is flat and almost perfect. Then $\pi_0 M$ is a left module over $\pi_0 R$ which is finitely presented and flat, and therefore projective. Using Proposition 7.2.2.18, we deduce that M is projective. Choose a map $f : P \to M$, where P is a free left R-module of finite rank and the induced map $\pi_0 P \to \pi_0 M$ is surjective. Since M is projective, the map f splits, so that M is a summand of P. This proves (1). □

It follows from Proposition 7.2.4.20 that if an almost perfect left R-module M is flat, then M is perfect. We conclude with a mild generalization of this statement, where the flatness hypothesis is relaxed.

Definition 7.2.4.21. Let R be a connective $\mathbb{E}_1$-ring. We will say that a left R-module M has Tor-*amplitude* $\leq n$ if, for every discrete right R-module N, the homotopy groups $\pi_i(N \otimes_R M)$ vanish for $i > n$. We will say that M is *of finite* Tor-*amplitude* if it has Tor-amplitude $\leq n$ for some integer n.

Remark 7.2.4.22. In view of Theorem 7.2.2.15, a connective left R-module M has Tor-amplitude ≤ 0 if and only if M is flat.

Proposition 7.2.4.23. *Let R be a connective $\mathbb{E}_1$-ring.*

(1) *If M is a left R-module of* Tor-*amplitude $\leq n$, then $M[k]$ has* Tor-*amplitude $\leq n + k$.*

(2) *Let*
$$M' \to M \to M''$$
be a fiber sequence of left R-modules. If M' and M'' have Tor-*amplitude $\leq n$, then so does M.*

(3) *Let M be a left R-module of* Tor-*amplitude $\leq n$. Then any retract of M has* Tor-*amplitude $\leq n$.

小红书
小红书号:3189205503 qq

(4) *Let M be an almost perfect left module over R. Then M is perfect if and only if M has finite* Tor-*amplitude.*

(5) *Let M be a left module over R having* Tor-*amplitude $\leq n$. For every $N \in (\mathrm{RMod}_R)_{\leq 0}$, the homotopy groups $\pi_i(N \otimes_R M)$ vanish for $i > n$.*

Proof. The first three assertions follow immediately from the exactness of the functor $N \mapsto N \otimes_R M$. It follows that the collection left R-modules of finite Tor-amplitude is stable under retracts and finite colimits, and contains the module $R[n]$ for every integer n. This proves the "only if" direction of (4). For the converse, let us suppose that M is almost perfect and of finite Tor-amplitude. We wish to show that M is perfect. We first apply (1) to reduce to the case where M is connective. The proof now goes by induction on the Tor-amplitude n of M. If $n = 0$, then M is flat and we may conclude by applying Proposition 7.2.4.20. We may therefore assume $n > 0$.

Since M is almost perfect, there exists a free left R-module P of finite rank and a fiber sequence

$$M' \to P \xrightarrow{f} M$$

where f is surjective. To prove that M is perfect, it will suffice to show that P and M' are perfect. It is clear that P is perfect, and it follows from Proposition 7.2.4.11 that M' is almost perfect. Moreover, since f is surjective, M' is connective. We will show that M' is of Tor-amplitude $\leq n-1$; the inductive hypothesis will then imply that M is perfect, and the proof will be complete.

Let N be a discrete right R-module. We wish to prove that $\pi_k(N \otimes_R M') \simeq 0$ for $k \geq n$. Since the functor $N \otimes_R \bullet$ is exact, we obtain for each k an exact sequence of homotopy groups

$$\pi_{k+1}(N \otimes_R M) \to \pi_k(N \otimes_R M') \to \pi_k(N \otimes_R P).$$

The left entry vanishes in virtue of our assumption that M has Tor-amplitude $\leq n$. We now complete the proof of (4) by observing that $\pi_k(N \otimes_R P)$ is a finite direct sum of copies of $\pi_k N$, and therefore vanishes because $k \geq n > 0$ and N is discrete.

We now prove (5). Assume that M has Tor-amplitude $\leq m$. Let $N \in (\mathrm{RMod}_R)_{\leq 0}$; we wish to prove that $\pi_i(N \otimes_R M) \simeq 0$ for $i > n$. Since $N \simeq \varinjlim \tau_{\geq -m} N$, it will suffice to prove the vanishing after replacing N by $\tau_{\geq -m} N$ for every integer m. We may therefore assume that $N \in (\mathrm{RMod}_R)_{\geq -m}$ for some $m \geq 0$. We proceed by induction on m. When $m = 0$, the desired result follows immediately from our assumption on M. If $m > 0$, we have a fiber sequence

$$\tau_{\geq 1-m} N \to N \to (\pi_{-m} N)[-m],$$

hence an exact sequence

$$\pi_i((\tau_{\geq 1-m} N) \otimes_R M) \to \pi_i(N \otimes_R M) \to \pi_{i+m}(\pi_{-m} N \otimes_R M).$$

If $i > n$, then the first group vanishes by the inductive hypothesis, and the second by virtue of our assumption that M has Tor-amplitude $\leq n$. □

小红书号:3189205503 qq

Remark 7.2.4.24. Let R be a connective $\mathbb{E}_1$-ring, and let $\mathcal{C}$ be the smallest stable subcategory of LMod_R which contains all finitely generated projective modules. Then $\mathcal{C} = \mathrm{LMod}_R^{\mathrm{perf}}$. The inclusion $\mathcal{C} \subseteq \mathrm{LMod}_R^{\mathrm{perf}}$ is obvious. To prove the converse, we must show that every object $M \in \mathrm{LMod}_R^{\mathrm{perf}}$ belongs to $\mathcal{C}$. Invoking Corollary 7.2.4.5, we may reduce to the case where M is connective. We then work by induction on the (necessarily finite) Tor-amplitude of M. If M is of Tor-amplitude ≤ 0, then M is flat and the desired result follows from Proposition 7.2.4.20. In the general case, we choose a finitely generated free R-module P and a map $f : P \to M$ which induces a surjection $\pi_0 P \to \pi_0 M$ (which is possible in view of Corollary 7.2.4.5). As in the proof of Proposition 7.2.4.23, we may conclude that that fiber K of f is a connective perfect module of smaller Tor-amplitude than that of M, so that $K \in \mathcal{C}$ by the inductive hypothesis. Since $P \in \mathcal{C}$ and $\mathcal{C}$ is stable under the formation of cofibers, we conclude that $M \in \mathcal{C}$ as desired.

Example 7.2.4.25. Let R be an associative ring which we regard as a discrete $\mathbb{E}_1$-ring. Let $\mathrm{LMod}_R^- \subseteq \mathrm{LMod}_R$ be the full subcategory consisting of bounded-above objects, and let $M \in \mathrm{LMod}_R^-$. Using an inverse to the functor θ of Proposition 7.1.1.15, we can identify any $M \in \mathrm{LMod}_R^-$ with a (bounded above) complex $P_\bullet$ in the abelian category of (discrete) R-modules. It follows from Remark 7.2.4.24 that M is perfect if and only if $P_\bullet$ can be chosen to have only finitely many terms, each of which is finitely generated over R.

We conclude this section by discussing some finiteness conditions for algebras over structured ring spectra.

Definition 7.2.4.26. Let $1 \leq k \leq \infty$ and let R be a connective $\mathbb{E}_{k+1}$-ring. We let $\mathrm{Free} : \mathrm{LMod}_R \to \mathrm{Alg}_R^{(k)}$ denote a left adjoint to the forgetful functor. Note that Free carries connective R-modules to connective $\mathbb{E}_k$-algebras over R. Let A be a connective $\mathbb{E}_k$-algebra over R. We say that A is:

- *finitely generated and free* if there exists a finitely generated free left R-module M and an equivalence $A \simeq \mathrm{Free}(M)$ in $\mathrm{Alg}_R^{(k)}$. We let $\mathrm{Alg}_R^{(k),\mathrm{free}}$ denote the full subcategory spanned by the finitely generated free algebras.

- *of finite presentation* if A belongs to the smallest full subcategory of $\mathrm{Alg}_R^{(k)}$ which contains $\mathrm{Alg}_R^{(k),\mathrm{free}}$ and is stable under finite colimits.

- *locally of finite presentation* if A is a compact object of $\mathrm{Alg}_R^{(k)}$.

- *almost of finite presentation* if A is an almost compact object of $\mathrm{Alg}_R^{(k)}$ (see Definition 7.2.4.8): that is, if $\tau_{\leq n} A$ is a compact object of $\tau_{\leq n} \mathrm{Alg}_R^{(k)}$ for all $n \geq 0$.

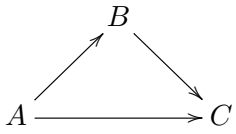
The basic properties of Definition 7.2.4.26 can be summarized as follows:

Proposition 7.2.4.27. *Let $1 \leq k \leq \infty$ and let R be a connective $\mathbb{E}_{k+1}$-ring. Then:*

小红书
小红书号:3189205503 qq

(1) *The ∞-category $\mathrm{Alg}_R^{(k),\mathrm{cn}}$ is projectively generated (Definition HTT.5.5.8.23). Moreover, a connective R-algebra A is a compact projective object of $\mathrm{Alg}_R^{(k),\mathrm{cn}}$ if and only if A is a retract of a finitely generated free commutative R-algebra.*

(2) *Let $\mathrm{Alg}_R^{(k),\mathrm{fp}} \subseteq \mathrm{Alg}_R^{(k)}$ denote the full subcategory spanned by those $\mathbb{E}_k$-algebras over R which are connective and of finite presentation. Then the inclusion induces an equivalence $\mathrm{Ind}(\mathrm{Alg}_R^{(k),\mathrm{fp}}) \simeq \mathrm{Alg}_R^{(k)}$.*



(3) *The ∞-category $\mathrm{Alg}_R^{(k),\mathrm{cn}}$ of connective $\mathbb{E}_k$-algebras over R is compactly generated. The compact objects of $\mathrm{Alg}_R^{(k),\mathrm{cn}}$ are those connective $\mathbb{E}_k$-algebras which are locally of finite presentation over R.*

(4) *A connective $\mathbb{E}_k$-algebra A over R is almost of finite presentation if and only if, for each $n \geq 0$, there exists an R-algebra A' of finite presentation such that $\tau_{\leq n}A$ is a retract of $\tau_{\leq n}A'$.*

Proof. Assertion (1) from Corollary 7.1.4.17 and its proof. Assertion (2) then follows from Proposition HTT.5.3.5.11 , (3) from Lemma HTT.5.4.2.4 , and (4) from Corollary HTT.5.5.7.4 . □

Remark 7.2.4.28. Let $R \to R'$ be a map of connective $\mathbb{E}_{k+1}$-rings, let $A \in \mathrm{Alg}_R^{(k),\mathrm{cn}}$ be a connective $\mathbb{E}_k$-algebra over R, and let $A' \simeq R' \otimes_R A$ be the image of A in $\mathrm{Alg}_{R'}^{(k),\mathrm{cn}}$. If A is free and finitely generated (finitely presented, almost finitely presented) over R, then A' is free and finitely generated (finitely presented, almost finitely presented) over R'. In the first three cases, this is obvious. The last two follow from assertions (3) and (4) of Proposition 7.2.4.27, together with the observation that $\tau_{\leq n}A' \simeq \tau_{\leq n}(R' \otimes_R \tau_{\leq n}A)$.

Remark 7.2.4.29. Suppose given a commutative diagram

of $\mathbb{E}_\infty$-rings, where B is of locally of finite presentation over A. Then C is locally of finite presentation over B if and only if C is locally of finite presentation over A. This follows immediately from Propositions 7.2.4.27 and HTT.5.4.5.15 . In §7.4.3, we will prove the analogue of this statement for morphisms which are almost of finite presentation.

Definition 7.2.4.30. Let R be a connective $\mathbb{E}_k$-ring for $2 \leq k \leq \infty$. We will say that R is *left coherent* if it is left coherent, when regarded as an $\mathbb{E}_1$-ring: that is, if $\pi_0 R$ is a coherent ring (in the sense of ordinary commutative algebra) and each homotopy group $\pi_i R$ is a finitely presented module over $\pi_0 R$. We will say that R is *Noetherian* if R is coherent and the ordinary commutative ring $\pi_0 R$ is Noetherian.

小红书
小红书号:3189205503 qq

The following result relates some of the absolute and relative finiteness conditions introduced above:

Proposition 7.2.4.31 (Hilbert Basis Theorem)**.** *Let $f : R \to R'$ be a map of connective $\mathbb{E}_\infty$-rings. Suppose that R is Noetherian. Then R' is almost of finite presentation as an R-algebra if and only if the following conditions are satisfied:*

(1) *The ring $\pi_0 R'$ is a finitely generated $\pi_0 R$-algebra.*

(2) *The $\mathbb{E}_\infty$-ring R' is Noetherian.*

Proof. We first prove the "only if" direction. We first note that $\pi_0 R' = \tau_{\leq 0} R'$ is a compact object in the ordinary category of commutative $\pi_0 R$-algebras. This proves (1). The classical Hilbert basis theorem implies that $\pi_0 R'$ is Noetherian. It remains only to show that each $\pi_n R'$ is a finitely generated module over $\pi_0 R'$. This condition depends only on the truncation $\tau_{\leq n} R'$. In view of part (4) of Proposition 7.2.4.27, we may assume that R' is a finitely presented commutative R-algebra.

Let $\mathcal{C}$ be the full subcategory of CAlg_R spanned by those connective $\mathbb{E}_\infty$-algebras over R which satisfy (1) and (2). To show that $\mathcal{C}$ contains all finitely presented R-algebras, it will suffice to show that $\mathcal{C}$ is stable under finite colimits, and contains the free commutative R-algebra on a single generator. We first prove the stability under finite colimits. In view of Corollary HTT.4.4.2.4 , it will suffice to show that $R \in \mathcal{C}$ and that $\mathcal{C}$ is stable under pushouts. The inclusion $R \in \mathcal{C}$ is obvious (since R is Noetherian by assumption). Suppose given a pushout diagram

$$\begin{array}{ccc} A & \longrightarrow & A' \\ \downarrow & & \downarrow \\ A'' & \longrightarrow & A' \otimes_A A'' \end{array}$$

in CAlg_R, where $A, A', A'' \in \mathcal{C}$. We wish to prove that $A' \otimes_A A'' \in \mathcal{C}$. According to Corollary 7.2.1.23, the commutative ring $B = \pi_0(A' \otimes_A A'')$ is canonically isomorphic to the classical tensor product $\pi_0 A' \otimes_{\pi_0 A} \pi_0 A''$, and is therefore a finitely generated commutative $\pi_0 R$-algebra. Thus $A' \otimes_A A''$ satisfies (1). Moreover, Proposition 7.2.1.19 yields a convergent spectral sequence

$$E_2^{p,q} = \mathrm{Tor}_p^{\pi_* A}(\pi_* A', \pi_* A'')_q \Rightarrow \pi_{p+q}(A' \otimes_A A'').$$

It is not difficult to see that this is a spectral sequence of modules over the commutative ring B. Each of the B-modules $E_2^{p,q}$ is a finitely generated B-module. It follows that the subquotients $E_\infty^{p,q}$ are likewise finitely generated over B. Consequently, each homotopy group $\pi_n(A' \otimes_A A'')$ has a finite filtration by finitely generated B-modules, and is therefore itself finitely generated over B. This proves that $A' \otimes_A A''$ satisfies (2), and therefore belongs to the ∞-category $\mathcal{C}$.

Let $R\{X\} = \mathrm{Sym}^*(R)$ denote the free commutative R-algebra on a single generator. We wish to show that $R\{X\} \in \mathcal{C}$. We first treat the case where R is discrete. Let k denote the commutative

小红书
小红书号:3189205503 qq

ring $\pi_0 R$. Proposition 3.1.3.13 supplies canonical isomorphisms

$$\pi_m R\{X\} \simeq \pi_m(\coprod_n \mathrm{Sym}^n(R)) \simeq \oplus_{n \geq 0} \mathrm{H}_m(B\Sigma_n; k).$$

In particular, $\pi_0 R\{X\}$ is canonically isomorphic to the polynomial ring $k[x]$, which proves (1). To prove (2), we must show that each of the groups $\oplus_{n \geq 0} \mathrm{H}_m(\Sigma_n; k)$ is a finitely generated $k\{x\}$-module. Since the homology of a finite group can be computed using a finite complex, each of the groups $\mathrm{H}_m(B\Sigma_n; k)$ is individually a finite k-module. Moreover, multiplication by x is given by the maps

$$\eta_{m,n} : \mathrm{H}_m(B\Sigma_n; k) \to \mathrm{H}_m(B\Sigma_{n+1}; k)$$

induced by the inclusions $\Sigma_n \subseteq \Sigma_{n+1}$. To complete the proof, it will suffice to show that for fixed m, $\eta_{m,n}$ is surjective for $n \gg 0$. This follows from Nakaoka's homological stability theorem for the symmetric groups (for a simple proof, we refer to the reader to [86]).

Let us now treat the general case. Let B denote the polynomial ring $\pi_0 R\{X\} = (\pi_0 R)[X]$. Then B is finitely generated over $\pi_0 R$, so $R\{X\}$ satisfies (1). We wish to prove that $R\{X\}$ satisfies (2). Assume otherwise, and choose m minimal such that $\pi_m R\{X\}$ is not a finitely generated B-module; note that m is necessarily positive. Set $R_0 = \tau_{\leq 0}$. Then the argument above proves that the tensor product $R_0 \otimes_R R\{X\} \simeq R_0\{X\}$ belongs to $\mathcal{C}$. Invoking Proposition 7.2.1.19 again, we obtain a convergent spectral sequence of B-modules

$$E_2^{p,q} = \mathrm{Tor}_p^{\pi_* R}(\pi_0 R, \pi_*(R\{X\}))_q \Rightarrow \pi_{p+q}(R_0\{X\}).$$

Using the minimality of m, we deduce that $E_2^{p,q}$ is finitely generated over B for all $q < m$. It follows that $E_\infty^{0,m}$ is the quotient of $E_2^{0,m}$ by a finitely generated submodule. Since $E_\infty^{0,m}$ is a submodule of the finitely generated B-module $\pi_m(R_0\{X\})$, we conclude that $E_2^{0,m}$ is itself finitely generated over B. But $E_2^{0,m}$ contains $\pi_m(R\{X\})$ as a summand, contradicting our choice of m. This completes the proof of the "only if" direction.

Now suppose that R' satisfies (1) and (2). We will construct a sequence of maps $\psi_n : A_n \to R'$ in CAlg_R with the property that the maps ψ_n induce isomorphisms $\pi_m A_n \to \pi_m R'$ for $m < n$ and surjections $\pi_n A_n \to \pi_n R'$. To construct A_0, we invoke assumption (1): choose a finite set of elements $x_1, \ldots, x_i \in \pi_0 R'$ which generate $\pi_0 R'$ as an $\pi_0 R$-algebra. These elements determine a map of R-algebras $\psi_0 : \mathrm{Sym}^*(R^i) \to R'$ with the desired property.

Let us now suppose that $\psi_n : A_n \to R'$ has already been constructed. Let K denote the fiber of the map ψ_n, formed in the ∞-category of A_n-modules. Our assumption on ψ_n implies that $\pi_i K \simeq 0$ for $i < n$. Let $B = \pi_0 A_n$. Since A_n is almost of finite presentation over R, the first part of the proof shows that B is a Noetherian ring and that each of the homotopy groups $\pi_i A_n$ is a finitely generated B-module. Moreover, since the map $B \to \pi_0 R'$ is surjective and R' satisfies (2), we conclude that each of the homotopy groups $\pi_i R'$ is a finitely generated B-module. Using the long exact sequence

$$\ldots \to \pi_{n+1} R' \to \pi_n K \to \pi_n A_n \to \ldots$$

小红书
小红书号:3189205503 qq

we deduce that $\pi_n K$ is a finitely generated B-module. Consequently, there exists a finitely generated free A_n-module M and a map $M[n] \to K$ which is surjective on π_n. Let $f : \mathrm{Sym}^*(M[n]) \to A_n$ be the induced map, and form a pushout diagram

$$\begin{array}{ccc} \mathrm{Sym}^*(M[n]) & \xrightarrow{f} & A_n \\ \downarrow{\scriptstyle f_0} & & \downarrow{\scriptstyle f_0'} \\ A_n & \longrightarrow & A_{n+1}, \end{array}$$

where f_0 classifies the zero from $M[n]$ to A_n. By construction, we have a canonical homotopy from $\psi_n \circ f$ to $\psi_n \circ f_0$, which determines a map $\psi_{n+1} : A_{n+1} \to R'$. We observe that there is a fiber sequence of A_n-modules

$$\mathrm{fib}(f_0') \to \mathrm{fib}(\psi_n) \to \mathrm{fib}(\psi_{n+1}).$$

To show that ψ_{n+1} has the desired properties, it suffices to show that $\pi_i \mathrm{fib}(\psi_{n+1}) \simeq 0$ for $i \leq n$. Using the long exact sequence associated to the fiber sequence above, we may reduce to proving the following pair of assertions:

(a) The homotopy groups $\pi_i \mathrm{fib}(f_0')$ vanish for $i < n$.

(b) The canonical map $\pi_n \mathrm{fib}(f_0') \to \pi_n K$ is surjective.

We now observe that there is an equivalence $\mathrm{fib}(f_0') \simeq \mathrm{fib}(f_0) \otimes_{\mathrm{Sym}^*(M[n])} A_n$. In view of Corollary 7.2.1.23, it will suffice to prove the same assertions after replacing f_0' by f_0. Using Proposition 3.1.3.13, we obtain a canonical equivalence

$$\mathrm{fib}(f_0) \simeq \bigoplus_{m>0} \mathrm{Sym}^m(M[n]).$$

Because the ∞-category $\mathrm{Mod}_{A_n}^{\mathrm{cn}}$ is closed under colimits in Mod_{A_n}, it follows that the homotopy groups $\pi_i \mathrm{Sym}^m(M[n])$ vanish for $i < mn$. This proves (a). To prove (b), it will suffice to show that the composite map

$$M[n] \simeq \mathrm{Sym}^1(M[n]) \to \bigoplus_{m>0} \mathrm{Sym}^m(M[n]) \to K$$

induces a surjection on π_n, which follows immediately from our construction. □

7.3 The Cotangent Complex Formalism

Let R be a connective $\mathbb{E}_\infty$-ring. Then $\pi_0 R$ is an ordinary commutative ring. We can view $\pi_0 R$ as the underlying commutative ring of R, so that the $\mathbb{E}_\infty$-ring R is determined by $\pi_0 R$ together with some additional information, which is somehow encoded in the higher homotopy groups of

小红书
小红书号:3189205503 qq

R. It often useful to think of this information as "infinitesimal" in nature, so that the truncation map $R \to \pi_0 R$ (which kills the higher homotopy groups of R) is somehow very close to being an equivalence. Our goal in this section is to develop some technology which will allow us to exploit this idea: namely, the theory of the *cotangent complex* of an $\mathbb{E}_\infty$-ring.

We begin by reviewing a bit of classical commutative algebra. Suppose we are given a pair of commutative rings A and B, and that we wish to study ring homomorphisms from A to B. Writing A as a quotient of a polynomial ring (perhaps on infinitely many generators), this amounts to finding the solutions to some set of polynomial equations in B. This problem is generally very difficult. However, if we fix a ring a homomorphism $\phi : A \to B$, it is often not very difficult to describe all ring homomorphisms $\phi' : A \to B$ which are sufficiently "close" to ϕ. For example, suppose we are given an ideal $I \subseteq B$ such that $I^2 = 0$, and that we wish to classify ring homomorphisms $\phi' : A \to B$ such that $\phi(x) \cong \phi'(x)$ modulo I for all $x \in A$. In this case, we can write $\phi'(x) = \phi(x) + dx$ for some map $d : A \to I$. Since $I^2 = 0$, the condition that ϕ' is a ring homomorphism translates into a relatively simple condition on d: namely, it must satisfy the Leibniz rule $d(xy) = \phi(x)dy + \phi(y)dx$. In summary, the classification of ring homomorphisms $\phi' : A \to B$ which are congruent to ϕ modulo I requires only that we solve a set of linear equations, rather than a set of polynomial equations. This is quite a bit more tractable.

To study the situation more systematically, it is convenient to introduce a bit of terminology. Let A be a commutative ring and let M be an A-module. A *derivation* from A into M is a map $d : A \to M$ satisfying the conditions

$$d(x + y) = dx + dy \qquad d(xy) = xdy + ydx.$$

The collection of derivations of A into M forms an abelian group, which we will denote by $\mathrm{Der}(A, M)$. If A is fixed, then the functor $M \mapsto \mathrm{Der}(A, M)$ is corepresented by an A-module Ω_A, called the A-module of *absolute Kähler differentials*. One can construct Ω_A explicitly as a quotient of the free module generated by symbols $\{dx\}_{x \in A}$ by the submodule generated by the elements $\{d(x + y) - dx - dy, d(xy) - x(dy) - y(dx)\}_{x,y \in A}$.

Our goal in this section is to introduce an analogue of the construction $A \mapsto \Omega_A$, where we replace the commutative ring A with an arbitrary $\mathbb{E}_\infty$-ring. More precisely, if A is an $\mathbb{E}_\infty$-ring, we will define an A-module spectrum L_A, which we call the *absolute cotangent complex* of A. By construction, L_A will enjoy the following universal property: for any A-module M, there is a bijection between homotopy classes of maps $L_A \to M$ with homotopy classes of *derivations* of A into M.

To make this idea precise, we need a new definition of derivation: the definition for ordinary commutative rings given above is given in terms of equations, and does not generalize easily to the ∞-categorial setting. Instead, let us take our cue from the preceding discussion. If $\phi, \phi' : A \to B$ are two ring homomorphisms between commutative rings A and B which are congruent modulo an ideal $I \subseteq B$ with $I^2 = 0$, then $\phi' - \phi$ is a derivation from A into I. Every derivation from a

小红书
小红书号:3189205503 qq

commutative ring A into an A-module M arises in this way. To see this, we can take B to be the direct sum $A \oplus M$, equipped with the ring structure given by $(a, m)(a', m') = (aa', am' + a'm)$. There is a natural inclusion $\phi : A \to B$, and we can identify M with an ideal of B satisfying $M^2 = 0$, so that $\mathrm{Der}(A, M)$ can be identified with the set of ring homomorphsims from A into B which are congruent to ϕ modulo M: that is, with the collection of sections of the projection map $A \oplus M \to A$. This description of $\mathrm{Der}(A, M)$ does not directly require writing any equations: instead, it depends on our ability to endow the direct sum $A \oplus M$ with the structure of a commutative ring.

To describe the situation a little bit more systematically, let Ring denote the category of commutative rings, and Ring^+ the category of pairs (A, M), where A is a commutative ring and M is an A-module. A morphism in the category Ring^+ is a pair of maps $(f, f') : (A, M) \to (B, N)$, where $f : A \to B$ is a ring homomorphism and $f' : M \to N$ is a map of A-modules, (here we regard N as an A-module via transport of structure along f). Let $G : \mathrm{Ring}^+ \to \mathrm{Ring}$ be the square-zero extension functor given by the formula $(A, M) \mapsto A \oplus M$. Then the functor G admits a left adjoint F, which is described by the formula $F(A) = (A, \Omega_A)$. Here Ω_A is the A-module of Kähler differentials defined above.

We now make two observations:

(1) In addition to the functor G, there is a forgetful functor $G' : \mathrm{Ring}^+ \to \mathrm{Ring}$, given by $(A, M) \mapsto A$. Moreover, there is a natural transformation of functors from G to G', which can itself be viewed as a functor from Ring^+ into the category $\mathrm{Fun}([1], \mathrm{Ring})$ of arrows in Ring.

(2) For every commutative ring A, the fiber $G'^{-1}\{A\}$ is an abelian category (namely, the category of A-modules).

We wish to produce an analogous theory of derivations in the case where the category Ring is replaced by an arbitrary presentable ∞-category $\mathcal{C}$. What is the proper analogue of Ring^+ in this general situation? Observation (1) suggests that we should choose another ∞-category $\mathcal{C}^+$ equipped with a functor $\mathcal{C}^+ \to \mathrm{Fun}(\Delta^1, \mathcal{C})$. Observation (2) suggests that the fibers of composite map

$$\phi : \mathcal{C}^+ \to \mathrm{Fun}(\Delta^1, \mathcal{C}) \to \mathrm{Fun}(\{1\}, \mathcal{C}) \simeq \mathcal{C}$$

should be "abelian" in some sense. There is a good ∞-categorical analogue of the theory of abelian categories: the theory of *stable* ∞-categories introduced in Chapter 1. It is therefore natural to require that the the fibers of ϕ be stable. In §7.3.1, we will see that there is a canonical choice for the ∞-category $\mathcal{C}^+$ with these properties. We will refer to this canonical choice as the *tangent bundle* to $\mathcal{C}$ and denote by $T_{\mathcal{C}}$. Roughly speaking, an object of $T_{\mathcal{C}}$ consists of a pair (A, M), where $A \in \mathcal{C}$ and $M \in \mathrm{Sp}(\mathcal{C}^{/A})$.

Once we have established the theory of tangent bundles, we can proceed to define the analogue of the Kähler differentials functor. Namely, for any presentable ∞-category $\mathcal{C}$, we will define the

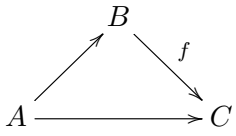
小红书
小红书号:3189205503 qq

cotangent complex functor $L : \mathcal{C} \to T_{\mathcal{C}}$ to be a left adjoint to the forgetful functor

$$T_{\mathcal{C}} \to \mathrm{Fun}(\Delta^1, \mathcal{C}) \to \mathrm{Fun}(\{0\}, \mathcal{C}) \simeq \mathcal{C}\,.$$

However, it is important to exercise some care here: in the algebraic situation, we want to make sure that the cotangent complex L_A of an $\mathbb{E}_\infty$-ring produces an A-module. In other words, we want to ensure that the composition

$$\mathcal{C} \xrightarrow{L} T_{\mathcal{C}} \to \mathrm{Fun}(\Delta^1, \mathcal{C}) \to \mathrm{Fun}(\{1\}, \mathcal{C}) \simeq \mathcal{C}$$



is the identity functor. We will construct a functor L with this property using a notion of *relative adjunction*, which we explain in §7.3.2.

Given an object $A \in \mathcal{C}$ and $M \in T_{\mathcal{C}} \times_{\mathcal{C}} \{A\}$, we can define the notion of a *derivation* of A into M. This can be described either as map from L_A into M in the ∞-category $T_{\mathcal{C}} \times_{\mathcal{C}} \{A\}$, or as a section of the canonical map $G(M) \to A$ in $\mathcal{C}$. For many purposes, it is convenient to work in an ∞-category containing both $\mathcal{C}$ and $T_{\mathcal{C}}$, in which the morphisms are given by derivations. Such an ∞-category is readily available: namely, the correspondence associated to the pair of adjoint functors $\mathcal{C} \underset{G}{\overset{L}{\rightleftarrows}} T_{\mathcal{C}}$, where G and L are defined as above. We will call this ∞-category the *tangent correspondence* to $\mathcal{C}$; an explicit construction will be given in §7.3.6.

In the classical theory of Kähler differentials, it is convenient to consider the absolute Kähler differentials Ω_A of a commutative ring A, but also the module of relative Kähler differentials $\Omega_{B/A}$ associated to a ring homomorphism $A \to B$. In §7.3.3 we will introduce an analogous *relative* version of the cotangent complex L. We will then establish some of the basic formal properties of the relative cotangent complex. For example, given a sequence of commutative ring homomorphisms $A \to B \to C$, there is an associated short exact sequence

$$\Omega_{B/A} \otimes_B C \to \Omega_{C/A} \to \Omega_{C/B} \to 0.$$

Corollary 7.3.3.6 provides an ∞-categorical analogue of this statement: for every commutative diagram

in a presentable ∞-category $\mathcal{C}$, there is an associated fiber sequence

$$f^* L_{B/A} \to L_{C/A} \to L_{C/B}$$

in the stable ∞-category $\mathrm{Sp}(\mathcal{C}^{/C})$.

In §7.3.4, we will specialize our abstract theory of the cotangent complex to the setting where $\mathcal{C}$ is the ∞-category CAlg of $\mathbb{E}_\infty$-rings. In this case, we will show that the tangent bundle $T_{\mathcal{C}}$ can be

小红书
小红书号:3189205503 qq

identified with the ∞-category $\mathrm{Mod}(\mathrm{Sp})$ consisting of pairs (A, M), where $A \in \mathrm{CAlg}$ is an $\mathbb{E}_\infty$-ring and $M \in \mathrm{Mod}_A$ is an A-module spectrum. In particular, we can view the cotangent complex L_A (or the relative cotangent complex $L_{A/B}$, if $\phi : B \to A$ is a map of $\mathbb{E}_\infty$-rings) as an A-module spectrum.

There are many variations on the theme described above. For example, if A is an $\mathbb{E}_k$-ring for some integer k, then $\mathrm{Sp}(\mathrm{Alg}^{(k)}_{/A})$ can be identified with the ∞-category $\mathrm{Mod}^{\mathbb{E}_k}_A(\mathrm{Sp})$ of $\mathbb{E}_k$-modules over A. When $k < \infty$, the results of §5.3.2 can be used to obtain useful explicit formula for the cotangent omplex $L_A \in \mathrm{Mod}^{\mathbb{E}_k}_A(\mathrm{Sp})$, which we explain in §7.3.5.

Roughly speaking, we can regard the cotangent complex L_A of an $\mathbb{E}_\infty$-ring A as an object which controls the "infinitesimal" behavior of A. Since the difference between a connective $\mathbb{E}_\infty$-ring A and the ordinary commutative ring $\pi_0 A$ is purely "infinitesimal," one can often reduce questions about A to questions about the ordinary commutative ring $\pi_0 A$ and questions about the cotangent complex L_A. We will exploit this principle systematically in §7.4.

Remark 7.3.0.1. If A is an $\mathbb{E}_\infty$-ring, the homotopy groups of the cotangent complex L_A are often called the *topological André-Quillen homology groups* of A, and have been studied by many authors. We refer the reader to [10], [11], [8], and [105].

Warning 7.3.0.2. The classical theory of André-Quillen homology is obtained by forming the nonabelian left derived functor of the Kähler differentials functor $A \mapsto \Omega_A$. If A is a commutative ring, then this construction does not generally recover the cotangent complex L_A studied in this book, unless we assume that A contains the field $\mathbf{Q}$ of rational numbers.

7.3.1 Stable Envelopes and Tangent Bundles

Let $p : \mathcal{C} \to \mathcal{D}$ be a categorical fibration of ∞-categories. In §6.2.2, we introduced a new ∞-category $\mathrm{St}(p)$ whose objects are pairs (D, X), where D is an object of $\mathcal{D}$ and X is a spectrum object of the fiber $\mathcal{C}_D$ (see Construction 6.2.2.2). This definition is sensible only in cases where the fibers of p are pointed ∞-categories. In this section, we will discuss a slightly different construction, given by applying fiberwise application of the stabilization construction $\mathcal{E} \mapsto \mathrm{Sp}(\mathcal{E})$ procedure of Definition 1.4.2.8. We will then apply this construction to define the *tangent bundle* $T_{\mathcal{C}}$ of a presentable ∞-category $\mathcal{C}$.

Definition 7.3.1.1. Let $\mathcal{C}$ be a presentable ∞-category. A *stable envelope* of $\mathcal{C}$ is a categorical fibration $u : \mathcal{C}' \to \mathcal{C}$ with the following properties:

(i) The ∞-category $\mathcal{C}'$ is stable and presentable.

(ii) The functor u admits a left adjoint.

(iii) For every presentable stable (pointed) ∞-category $\mathcal{E}$, composition with u induces an equivalence of ∞-categories $\mathrm{RFun}(\mathcal{E}, \mathcal{C}') \to \mathrm{RFun}(\mathcal{E}, \mathcal{C})$. Here $\mathrm{RFun}(\mathcal{E}, \mathcal{C}')$ denotes the full subcat-

小红书 小红书号:3189205503 qq

egory of $\mathrm{Fun}(\mathcal{E}, \mathcal{C}')$ spanned by those functors which admit left adjoints, and $\mathrm{RFun}(\mathcal{E}, \mathcal{C})$ is defined similarly.

More generally, suppose that $p : \mathcal{C} \to \mathcal{D}$ is a presentable fibration. A *stable envelope* of p is a categorical fibration $u : \mathcal{C}' \to \mathcal{C}$ with the following properties:

(1) The composition $p \circ u$ is a presentable fibration.

(2) The functor u carries $(p \circ u)$-Cartesian morphisms of $\mathcal{C}'$ to p-Cartesian morphisms of $\mathcal{C}$.

(3) For every object $D \in \mathcal{D}$, the induced map $\mathcal{C}'_D \to \mathcal{C}_D$ is a stable envelope of $\mathcal{C}'_D$.

Remark 7.3.1.2. Let $\mathcal{C}$ be a presentable ∞-category, so that the projection $p : \mathcal{C} \to \Delta^0$ is a presentable fibration. It follows immediately from the definitions that a map $u : \mathcal{C}' \to \mathcal{C}$ is a stable envelope of $\mathcal{C}$ if and only if u is a stable envelope of p.

Let $p : \mathcal{C} \to \mathcal{D}$ be a presentable fibration, and let $u : \mathcal{C}' \to \mathcal{C}$ be a stable envelope of p. We will often abuse terminology by saying that $\mathcal{C}'$ is a a *stable envelope* of p, or that u *exhibits* $\mathcal{C}'$ *as a stable envelope of* p. In the case where $\mathcal{D} \simeq \Delta^0$, we will say instead that $\mathcal{C}'$ *is a stable envelope of* $\mathcal{C}$, or that u *exhibits* $\mathcal{C}'$ *as a stable envelope of* $\mathcal{C}$.

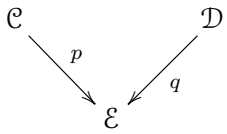
Remark 7.3.1.3. Suppose given a pullback diagram of simplicial sets

$$\begin{array}{ccc} \mathcal{C}_0 & \longrightarrow & \mathcal{C} \\ \downarrow{\scriptstyle p_0} & & \downarrow{\scriptstyle p} \\ \mathcal{D}_0 & \longrightarrow & \mathcal{D} \end{array}$$

where p (and therefore also p_0) is a presentable fibration. If $u : \mathcal{C}' \to \mathcal{C}$ is a stable envelope of the presentable fibration p, then the induced map $\mathcal{C}' \times_{\mathcal{C}} \mathcal{C}_0 \to \mathcal{C}_0$ is a stable envelope of the presentable fibration p_0.

Example 7.3.1.4. Let $\mathcal{C}$ be a presentable ∞-category. Then the map $\Omega^\infty_{\mathcal{C}} : \mathrm{Sp}(\mathcal{C}) \to \mathcal{C}$ exhibits $\mathrm{Sp}(\mathcal{C})$ as a stable envelope of $\mathcal{C}$. This follows immediately from Corollary 1.4.4.5.

Example 7.3.1.5. Let $p : \mathcal{C} \to \mathcal{D}$ be a presentable fibration, and let $\mathrm{St}(p)$ be defined as in Construction 6.2.2.2. Using Proposition 6.2.2.13, we see that the map $\Omega^\infty_p : \mathrm{St}(p) \to \mathcal{C}$ exhibits $\mathrm{St}(p)$ as a stable envelope of p.



Remark 7.3.1.6. Let $\mathcal{C}$ be a presentable ∞-category. A stable envelope of $\mathcal{C}$ is determined uniquely up to equivalence by the universal property given in Definition 7.3.1.1, and is therefore equivalent to $\mathrm{Sp}(\mathcal{C})$. More precisely, suppose we are given a commutative diagram

$$\begin{array}{ccc} \mathcal{C}' & \xrightarrow{w} & \mathcal{C}'' \\ & {\scriptstyle u} \searrow \quad \swarrow {\scriptstyle v} & \\ & \mathcal{C} & \end{array}$$

小红书
小红书号:3189205503 qq

in which u and v are stable envelopes of $\mathcal{C}$. Then the functor w is an equivalence of ∞-categories (observe that in this situation, the functor w automatically admits a left adjoint by virtue of Proposition 1.4.4.4).

Our next goal is to establish a relative version of Remark 7.3.1.6. First, we need to introduce a bit of notation. Suppose we are given a diagram

of ∞-categories, where p and q are presentable fibrations. We let $\mathrm{Fun}^R_{\mathcal{E}}(\mathcal{C}, \mathcal{D})$ denote the full subcategory of $\mathrm{Fun}_{\mathcal{E}}(\mathcal{C}, \mathcal{D})$ spanned by those functors $G : \mathcal{C} \to \mathcal{D}$ with the following properties:

(i) The functor G carries p-Cartesian edges of $\mathcal{C}$ to q-Cartesian edges of $\mathcal{D}$.

(ii) For each object $E \in \mathcal{E}$, the induced functor $G_E : \mathcal{C}_E \to \mathcal{D}_E$ admits a left adjoint.

We let $\mathrm{Fun}^R_{\mathcal{E}}(\mathcal{C}, \mathcal{D})^{\simeq}$ denote the largest Kan complex contained in $\mathrm{Fun}^R_{\mathcal{E}}(\mathcal{C}, \mathcal{D})$.

Proposition 7.3.1.7. *Let $p : \mathcal{C} \to \mathcal{D}$ be a presentable fibration of ∞-categories. Then there exists a functor $u : \mathcal{C}' \to \mathcal{C}$ with the following properties:*

(1) *The functor u is a stable envelope of the presentable fibration p.*

(2) *Let $q : \mathcal{E} \to \mathcal{D}$ be a presentable fibration, and assume that each fiber of q is a stable ∞-category. Then composition with u induces a trivial Kan fibration*

$$\mathrm{Fun}^R_{\mathcal{D}}(\mathcal{E}, \mathcal{C}')^{\simeq} \to \mathrm{Fun}^R_{\mathcal{D}}(\mathcal{E}, \mathcal{C})^{\simeq}.$$

(3) *Let $v : \mathcal{E} \to \mathcal{C}$ be any stable envelope of p. Then v factors as a composition*

$$\mathcal{E} \xrightarrow{\overline{v}} \mathcal{C}' \xrightarrow{u} \mathcal{C},$$

where $\overline{v}$ is an equivalence of ∞-categories.

Remark 7.3.1.8. Assertion (2) of Proposition 7.3.1.7 implies the stronger property that the map

$$\mathrm{Fun}^R_{\mathcal{D}}(\mathcal{E}, \mathcal{C}') \to \mathrm{Fun}^R_{\mathcal{D}}(\mathcal{E}, \mathcal{C})$$

is a trivial Kan fibration, but we will not need this fact.

小红书
小红书号:3189205503 qq

Proof. Let $\mathrm{R}\mathcal{P}\mathrm{r}$ denote the ∞-category whose objects are presentable ∞-categories and whose morphisms are functors which admit left adjoints (see §HTT.5.5.3), and let $\mathrm{R}\mathcal{P}\mathrm{r}^{\mathrm{stab}}$ be the full subcategory of $\mathrm{R}\mathcal{P}\mathrm{r}$ spanned by those presentable ∞-categories which are stable. It follows from Corollary 1.4.4.5 that the inclusion $\mathrm{R}\mathcal{P}\mathrm{r}^{\mathrm{stab}} \subseteq \mathrm{R}\mathcal{P}\mathrm{r}$ admits a right adjoint, given by the construction $\mathcal{X} \mapsto \mathrm{Sp}(\mathcal{X})$. Let us denote this right adjoint by G.

The presentable fibration p is classified by a functor $\chi : \mathcal{D}^{op} \to \mathrm{R}\mathcal{P}\mathrm{r}$. Let α denote the counit transformation $G \circ \chi \to \chi$. Then α is classified by a map $u : \mathcal{C}' \to \mathcal{C}$ of presentable fibrations over $\mathcal{D}$. Making a fibrant replacement if necessary, we may suppose that u is a categorical fibration. Assertion (1) now follows immediately from the construction.

To prove (2), let us suppose that the presentable fibration q is classified by a functor $\chi' : \mathcal{D}^{op} \to \mathrm{R}\mathcal{P}\mathrm{r}$. Using Theorem HTT.3.2.0.1 and Proposition HTT.4.2.4.4 , we deduce the existence of a commutative diagram

$$\begin{array}{ccc} \mathrm{Map}_{\mathrm{Fun}(\mathcal{D}^{op},\mathrm{R}\mathcal{P}\mathrm{r})}(\chi', G \circ \chi) & \longrightarrow & \mathrm{Map}_{\mathrm{Fun}(\mathcal{D}^{op},\mathrm{R}\mathcal{P}\mathrm{r})}(\chi', \chi) \\ \downarrow & & \downarrow \\ \mathrm{Fun}^{R,\sim}_{\mathcal{D}}(\mathcal{E}, \mathcal{C}') & \longrightarrow & \mathrm{Fun}^{R,\sim}_{\mathcal{D}}(\mathcal{E}, \mathcal{C}) \end{array}$$

in the homotopy category of spaces, where the vertical arrows are homotopy equivalences. Since the fibers of q are stable, χ' factors through $\mathrm{R}\mathcal{P}\mathrm{r}^{\mathrm{stab}} \subseteq \mathrm{R}\mathcal{P}\mathrm{r}$, so the upper horizontal arrow is a homotopy equivalence. It follows that the lower horizontal arrow is a homotopy equivalence as well. Since u is a categorical fibration, the lower horizontal arrow is also a Kan fibration, and therefore a trivial Kan fibration.

We now prove assertion (3). The existence of $\overline{v}$ (and its uniqueness up to homotopy) follows immediately from (2). To prove that $\overline{v}$ is an equivalence, we first invoke Corollary HTT.2.4.4.4 to reduce to the case where $\mathcal{D}$ consists of a single vertex. In this case, the result follows from Remark 7.3.1.6. □

Definition 7.3.1.9. Let $\mathcal{C}$ be a presentable ∞-category. A *tangent bundle to* $\mathcal{C}$ is a functor $T_{\mathcal{C}} \to \mathrm{Fun}(\Delta^1, \mathcal{C})$ which exhibits $T_{\mathcal{C}}$ as the stable envelope of the presentable fibration $\mathrm{Fun}(\Delta^1, \mathcal{C}) \to \mathrm{Fun}(\{1\}, \mathcal{C}) \simeq \mathcal{C}$.

In the situation of Definition 7.3.1.9, we will often abuse terminology by referring to $T_{\mathcal{C}}$ as the *tangent bundle* to $\mathcal{C}$. We note that $T_{\mathcal{C}}$ is determined up equivalence by $\mathcal{C}$. Roughly speaking, we may think of an object of $T_{\mathcal{C}}$ as a pair (A, M), where A is an object of $\mathcal{C}$ and M is a spectrum object of $\mathcal{C}_{/A}$. In the case where $\mathcal{C}$ is the ∞-category of $\mathbb{E}_\infty$-rings, we can identify M with an A-module (Corollary 7.3.4.14). In this case, the functor $T_{\mathcal{C}} \to \mathrm{Fun}(\Delta^1, \mathcal{C})$ associates to (A, M) the projection morphism $A \oplus M \to A$. Our terminology is justified as follows: we think of this morphism as a "tangent vector" in the ∞-category $\mathcal{C}$, relating the object A to the "infinitesimally near" object $A \oplus M$ (this analogy with differential geometry is based on suggestions of Tom Goodwillie).

小红书
小红书号:3189205503 qq

For some purposes, it is convenient to have an explicit construction for the tangent bundle $T_{\mathcal{C}}$ of a presentable ∞-category $\mathcal{C}$. The following is a variation on Example 7.3.1.5:

Proposition 7.3.1.10. *Let $\mathcal{C}$ be a presentable ∞-category, and let $e : \mathrm{Exc}(\mathcal{S}_*^{\mathrm{fin}}, \mathcal{C}) \to \mathrm{Fun}(\Delta^1, \mathcal{C})$ be the functor which carries an excisive functor $X : \mathcal{S}_*^{\mathrm{fin}} \to \mathcal{C}$ to the map $X(S^0) \to X(*)$. Then e exhibits $T_{\mathcal{C}}$ as a tangent bundle to $\mathcal{C}$.*

Proof. Let $\mathcal{E}$ denote the full subcategory of $\mathrm{Fun}(\Delta^1 \times \mathcal{S}_*^{\mathrm{fin}}, \mathcal{C})$ spanned by those functors $F : \Delta^1 \times \mathcal{S}_*^{\mathrm{fin}} \to \mathcal{C}$ with the following properties:

(*i*) The restriction $F|(\{0\} \times \mathcal{S}_*^{\mathrm{fin}})$ belongs to $T_{\mathcal{C}}$.

(*ii*) The canonical map $F(0, *) \to F(1, *)$ is an equivalence in $\mathcal{C}$.

(*iii*) For every pointed finite space X, the canonical map $F(1, X) \to F(1, *)$ is an equivalence in $\mathcal{C}$.

If we let $\mathcal{S}_*^{\mathrm{fin}\prime}$ denote the full subcategory of $\Delta^1 \times \mathcal{S}_*^{\mathrm{fin}}$ spanned by $\{0\} \times \mathcal{S}_*^{\mathrm{fin}}$ together with the object $(1, *)$, then (*iii*) is equivalent to the assertion that F is a right Kan extension of $F|\,\mathcal{S}_*^{\mathrm{fin}\prime}$, and (*ii*) is equivalent to the assertion that $F|\,\mathcal{S}_*^{\mathrm{fin}\prime}$ is a left Kan extension of $F|(\{0\} \times \mathcal{S}_*^{\mathrm{fin}})$. It follows from Proposition HTT.4.3.2.15 that restriction along the inclusion $\{0\} \times \mathcal{S}_*^{\mathrm{fin}} \hookrightarrow \Delta^1 \times \mathcal{S}_*^{\mathrm{fin}}$ induces a trivial Kan fibration $\phi : \mathcal{E} \to T_{\mathcal{C}}$.

Let $c : \mathcal{S}_*^{\mathrm{fin}} \to \mathcal{S}_*^{\mathrm{fin}}$ denote the constant functor taking the value $* \in \mathcal{S}_*^{\mathrm{fin}}$. There is a unique natural transformation $\mathrm{id} \to c$, classified by a map $h : \Delta^1 \times \mathcal{S}_*^{\mathrm{fin}} \to \mathcal{S}_*^{\mathrm{fin}}$. Composition with h determines a map $T_{\mathcal{C}} \to \mathcal{E}$ which is a section of the trivial Kan fibration ϕ. The map p factors as a composition

$$T_{\mathcal{C}} \to \mathcal{E} \xrightarrow{p'} \mathrm{Fun}(\Delta^1, \mathcal{C}),$$

where p' is given by evaluation at the object $S^0 \in \mathcal{S}_*^{\mathrm{fin}}$. It will therefore suffice to show that p' exhibits $\mathcal{E}$ as a tangent bundle to $\mathcal{C}$.

Let $\mathcal{E}' = \mathcal{E} \times_{\mathrm{Fun}(\{1\} \times \mathcal{S}_*^{\mathrm{fin}}, \mathcal{C})} \mathcal{C}$. Using Proposition HTT.4.3.2.15, we deduce that the inclusion $\mathcal{E}' \hookrightarrow \mathcal{E}$ is an equivalence of ∞-categories. Example 7.3.1.5 implies that the composite map $\mathcal{E}' \to \mathcal{E} \to \mathrm{Fun}(\Delta^1, \mathcal{C})$ exhibits $\mathcal{E}'$ as a stable envelope of $\mathrm{Fun}(\Delta^1, \mathcal{C}) \to \mathcal{C}$, from which it follows immediately that p' exhibits $\mathcal{E}$ as a tangent bundle to $\mathcal{C}$. □

Corollary 7.3.1.11. *Let $\mathcal{C}$ be a presentable ∞-category. Then the tangent bundle $T_{\mathcal{C}}$ is also a presentable ∞-category.*

Proof. It follows from Proposition 7.3.1.10 (and Lemmas HTT.5.5.4.19, HTT.5.5.4.17, and HTT.5.5.4.18) that $T_{\mathcal{C}}$ can be realized as an accessible localization of $\mathrm{Fun}(\mathcal{S}_*^{\mathrm{fin}}, \mathcal{C})$. □

It follows from Corollary 7.3.1.11 that if $\mathcal{C}$ is a presentable ∞-category, then the tangent bundle $T_{\mathcal{C}}$ admits small limits and colimits. The following result describes these limits and colimits in more detail:

小红书
小红书号:3189205503 qq

Proposition 7.3.1.12. *Let $\mathcal{C}$ be a presentable ∞-category, let $T_{\mathcal{C}}$ be a tangent bundle to $\mathcal{C}$, and let p denote the composition*

$$T_{\mathcal{C}} \to \mathrm{Fun}(\Delta^1, \mathcal{C}) \to \mathrm{Fun}(\{1\}, \mathcal{C}) \simeq \mathcal{C}\,.$$

Then:

(1) *A small diagram $\overline{q} : K^{\triangleright} \to T_{\mathcal{C}}$ is a colimit diagram if and only if $\overline{q}$ is a p-colimit diagram and $p \circ \overline{q}$ is a colimit diagram in $\mathcal{C}$.*

(2) *A small diagram $\overline{q} : K^{\triangleleft} \to T_{\mathcal{C}}$ is a limit diagram if and only if $\overline{q}$ is a p-limit diagram and $p \circ \overline{q}$ is a limit diagram in $\mathcal{C}$.*

Proof. We will prove (1); assertion (2) will follow from the same argument. The "if" direction follows from Proposition HTT.4.3.1.5. The converse then follows from the uniqueness of colimit diagrams and the following assertion:

($*$) Let K be a small simplicial set, and let $q : K \to T_{\mathcal{C}}$ be a diagram. Then q admits an extension $\overline{q} : K^{\triangleright} \to T_{\mathcal{C}}$ such that $\overline{q}$ is a p-colimit diagram, and $p \circ \overline{q}$ is a colimit diagram in $\mathcal{C}$.

To prove ($*$), we first invoke the assumption that $\mathcal{C}$ is presentable to deduce the existence of a colimit diagram $\overline{q}_0 : K^{\triangleright} \to \mathcal{C}$ extending $p \circ q$. It then suffices to show that we can lift $\overline{q}_0$ to a p-colimit diagram in $T_{\mathcal{C}}$; this follows from the fact that p is a presentable fibration. □

We now study the functorial properties of the construction of tangent bundles.

Lemma 7.3.1.13. *Let $\mathcal{C}$ be a presentable ∞-category, let $T_{\mathcal{C}} = \mathrm{Exc}(\mathcal{S}_*^{\mathrm{fin}}, \mathcal{C}) \subseteq \mathrm{Fun}(\mathcal{S}_*^{\mathrm{fin}}, \mathcal{C})$ the tangent bundle of $\mathcal{C}$ given in Proposition 7.3.1.10, and let $L : \mathrm{Fun}(\mathcal{S}_*^{\mathrm{fin}}, \mathcal{C}) \to T_{\mathcal{C}}$ be a left adjoint to the inclusion. A morphism $\alpha : X \to Y$ in $\mathrm{Fun}(\mathcal{S}_*^{\mathrm{fin}}, \mathcal{C})$ is an L-equivalence if and only if the following conditions are satisfied:*

(1) *The map $X(*) \to Y(*)$ is an equivalence in $\mathcal{C}$.*

(2) *Let $X', Y' : \mathcal{S}_*^{\mathrm{fin}} \to \mathcal{C}_{X(*)//Y(*)}$ be the functors determined by X and Y, and choose left Kan extensions $\overline{X}, \overline{Y} : \mathcal{S}_* \to \mathcal{C}_{X(*)//Y(*)}$ of X' and Y', respectively. Then the canonical map $\overline{X} \to \overline{Y}$ induces an equivalence $\partial \overline{X} \to \partial \overline{Y}$ in $\mathrm{Sp}(\mathcal{C}_{X(*)//Y(*)})$ (see Definition 6.2.1.1).*

Proof. Assume first that α is an L-equivalence. For each $K \in \mathcal{C}$, let $Z_K \in \mathrm{Fun}(\mathcal{S}_*^{\mathrm{fin}}, \mathcal{C})$ be the constant functor taking the value K. Note that Z_K is a right Kan extension of its restriction to $\{*\} \subseteq \mathcal{S}_*^{\mathrm{fin}}$. Since $Z_K \in T_{\mathcal{C}}$, composition with α induces a homotopy equivalence

$$\mathrm{Map}_{\mathcal{C}}(Y(*), K) \simeq \mathrm{Map}_{\mathrm{Fun}(\mathcal{S}_*^{\mathrm{fin}}, \mathcal{C})}(Y, Z_K) \to \mathrm{Map}_{\mathrm{Fun}(\mathcal{S}_*^{\mathrm{fin}}, \mathcal{C})}(X, Z_K) \simeq \mathrm{Map}_{\mathcal{C}}(X(*), K).$$

小红书
小红书号:3189205503 qq

Since K is arbitrary, condition (1) follows. To prove (2), let $\mathcal{C}'$ denote the pointed ∞-category $\mathcal{C}_{X(*)//Y(*)}$ and let $\overline{Z} : \mathcal{S}_* \to \mathcal{C}'$ be an arbitrary strongly excisive functor which commutes with sequential colimits. We wish to prove that the canonical map

$$\theta : \mathrm{Map}_{\mathrm{Fun}(\mathcal{S}_*, \mathcal{C}')}(\overline{Y}, \overline{Z}) \to \mathrm{Map}_{\mathrm{Fun}(\mathcal{S}_*, \mathcal{C}')}(\overline{X}, \overline{Z})$$

is a homotopy equivalence. Let $Z' = \overline{Z} | \mathcal{S}_*^{\mathrm{fin}}$. Since $\overline{X}$ and $\overline{Y}$ are left Kan extensions of X' and Y', respectively, we can identify θ with the map

$$\theta_0 : \mathrm{Map}_{\mathrm{Fun}(\mathcal{S}_*^{\mathrm{fin}}, \mathcal{C}')}(Y', Z') \to \mathrm{Map}_{\mathrm{Fun}(\mathcal{S}_*^{\mathrm{fin}}, \mathcal{C}')}(X', Z').$$

The map Z' induces a functor $Z : \mathcal{S}_*^{\mathrm{fin}} \to \mathcal{C}$. To prove that θ_0 is an equivalence, it suffices to show that the underlying map $\mathrm{Map}_{\mathrm{Fun}(\mathcal{S}_*^{\mathrm{fin}}, \mathcal{C})}(Y, Z) \to \mathrm{Map}_{\mathrm{Fun}(\mathcal{S}_*^{\mathrm{fin}}, \mathcal{C})}(X, Z)$ is a homotopy equivalence. This follows from our assumption that α is an L-equivalence and the observation that $Z \in T_{\mathcal{C}}$.

We now prove the converse. Assume that conditions (1) and (2) are satisfied; we wish to show that α is an L-equivalence. Fix an object $Z \in T_{\mathcal{C}}$. We have a commutative diagram

$$\begin{array}{ccc} \mathrm{Map}_{\mathrm{Fun}(\mathcal{S}_*^{\mathrm{fin}}, \mathcal{C})}(Y, Z) & \xrightarrow{\phi} & \mathrm{Map}_{\mathrm{Fun}(\mathcal{S}_*^{\mathrm{fin}}, \mathcal{C})}(X, Z) \\ \downarrow & & \downarrow \\ \mathrm{Map}_{\mathcal{C}}(Y(*), Z(*)) & \xrightarrow{\phi_0} & \mathrm{Map}_{\mathcal{C}}(X(*), Z(*)) \end{array}$$

and we wish to show that ϕ is a homotopy equivalence. Condition (1) implies that ϕ_0 is a homotopy equivalence. It will therefore suffice to show that ϕ induces a homotopy equivalence after passing to the homotopy fibers over any point $\eta \in \mathrm{Map}_{\mathcal{C}}(Y(*), Z(*))$. Let $K = Z(*)$ and let $\mathcal{C}'$ be defined as above, so that Z determines a functor $Z' : \mathcal{S}_*^{\mathrm{fin}} \to \mathcal{C}'$ given on objects by $Z'(U) = Z(U) \times_{Z(*)} Y(*)$. We observe that the induced map of homotopy fibers is given by $\phi' : \mathrm{Map}_{\mathrm{Fun}(\mathcal{S}_*^{\mathrm{fin}}, \mathcal{C}')}(Y', Z') \to \mathrm{Map}_{\mathrm{Fun}(\mathcal{S}_*^{\mathrm{fin}}, \mathcal{C}')}(X', Z')$. Let $\overline{Z} : \mathcal{S}_* \to \mathcal{C}'$ be a left Kan extension of Z', so that ϕ' is equivalent to the map

$$\overline{\phi} : \mathrm{Map}_{\mathrm{Fun}(\mathcal{S}_*, \mathcal{C}')}(\overline{Y}, \overline{Z}) \to \mathrm{Map}_{\mathrm{Fun}(\mathcal{S}_*, \mathcal{C}')}(\overline{X}, \overline{Z}).$$

Since $Z \in T_{\mathcal{C}}$, the functor Z' is strongly excisive, so that $\overline{Z}$ is also strongly excisive. It follows from assumption (2) that $\overline{\phi}$ is a homotopy equivalence, as desired. □

Proposition 7.3.1.14. *Let $f : \mathcal{C} \to \mathcal{D}$ be a functor between presentable ∞-categories which preserves filtered colimits. Let $T_{\mathcal{C}} \subseteq \mathrm{Fun}(\mathcal{S}_*^{\mathrm{fin}}, \mathcal{C})$ and $T_{\mathcal{D}} = \mathrm{Exc}(\mathcal{S}_*^{\mathrm{fin}}, \mathcal{D}) \subseteq \mathrm{Fun}(\mathcal{S}_*^{\mathrm{fin}}, \mathcal{D})$ be the tangent bundle of Proposition 7.3.1.10, and let $L : \mathrm{Fun}(\mathcal{S}_*^{\mathrm{fin}}, \mathcal{C}) \to T_{\mathcal{C}}$ and $L' : \mathrm{Fun}(\mathcal{S}_*^{\mathrm{fin}}, \mathcal{D}) \to T_{\mathcal{D}}$ denote left adjoints to the inclusion functor. Let $F : \mathrm{Fun}(\mathcal{S}_*^{\mathrm{fin}}, \mathcal{C}) \to \mathrm{Fun}(\mathcal{S}_*^{\mathrm{fin}}, \mathcal{D})$ be given by composition with f. Then F carries L-equivalents to L'-equivalences (and therefore induces a functor $T_{\mathcal{C}} \to T_{\mathcal{D}}$).*

Proof. Combine Corollary 6.2.1.24 with the criterion of Lemma 7.3.1.13. □

Example 7.3.1.15. Let $p : \mathcal{C}^{\otimes} \to \mathcal{O}^{\otimes}$ be a coCartesian fibration of ∞-operads. Assume that:

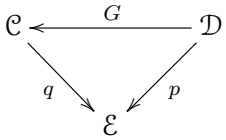
小红书
小红书号:3189205503 qq

(*i*) For every object $X \in \mathcal{O}$, the ∞-category $\mathcal{C}_X$ is presentable.

(*ii*) For every operation $\phi \in \mathrm{Mul}_{\mathcal{O}}(\{X_i\}_{i \in I}, Y)$, the associated functor $\phi_! : \prod_{i \in I} \mathcal{C}_{X_i} \to \mathcal{C}_Y$ preserves sequential colimits.

The projection map $p' : \mathrm{Fun}(\mathcal{S}_*^{\mathrm{fin}}, \mathcal{C}^{\otimes}) \times_{\mathrm{Fun}(\mathcal{S}_*^{\mathrm{fin}}, \mathcal{O}^{\otimes})} \mathcal{O}^{\otimes} \to \mathcal{O}^{\otimes}$ is again a coCartesian fibration of ∞-operads. Let $T_{\mathcal{C}}$ denote the full subcategory of $\mathrm{Fun}(\mathcal{S}_*^{\mathrm{fin}}, \mathcal{C}) \times_{\mathrm{Fun}(\mathcal{S}_*^{\mathrm{fin}}, \mathcal{O})} \mathcal{O}$ spanned by those objects which correspond to functors $F : \mathcal{S}_*^{\mathrm{fin}} \to \mathcal{C}_X$ which carry pushout squares to pullback squares (for some $X \in \mathcal{O}$), and let $T_{\mathcal{C}}^{\otimes}$ denote the corresponding full subcategory of $\mathrm{Fun}(\mathcal{S}_*^{\mathrm{fin}}, \mathcal{C}^{\otimes}) \times_{\mathrm{Fun}(\mathcal{S}_*^{\mathrm{fin}}, \mathcal{O}^{\otimes})} \mathcal{O}^{\otimes}$ (see Definition 2.2.1). Using Propositions 7.3.1.14 and 2.2.1.9, we conclude that the forgetful functor $T_{\mathcal{C}}^{\otimes} \to \mathcal{O}^{\otimes}$ is again a coCartesian fibration of ∞-operads. Taking $\mathcal{O}^{\otimes} = \mathbb{E}_k^{\otimes}$ for $1 \leq k \leq \infty$, we obtain the following result:

($*$) Let $\mathcal{C}$ be a presentable ∞-category equipped with an $\mathbb{E}_k$-monoidal structure, such that the tensor product functor $\otimes : \mathcal{C} \times \mathcal{C} \to \mathcal{C}$ preserves sequential colimits. Then the tangent bundle $T_{\mathcal{C}}$ inherits an $\mathbb{E}_k$-monoidal structure.



7.3.2 Relative Adjunctions

Let $\mathcal{C}$ be a presentable ∞-category and let $T_{\mathcal{C}}$ denote the tangent bundle of $\mathcal{C}$ (see Definition 7.3.1.9). Our goal in this section is to produce a left adjoint to the composite functor

$$T_{\mathcal{C}} \to \mathrm{Fun}(\Delta^1, \mathcal{C}) \to \mathrm{Fun}(\{0\}, \mathcal{C}) \simeq \mathcal{C}\,.$$

The existence of the desired left adjoint can be deduced easily from the adjoint functor theorem (Corollary HTT.5.5.2.9). However, we will later need more detailed information about L. To obtain this information, it is convenient to formulate a *relative* version of the theory of adjoint functors.

Proposition 7.3.2.1. *Suppose we are given a commutative diagram*

of ∞-categories, where the maps p and q are categorical fibrations. The following conditions are equivalent:

(1) *The functor G admits a left adjoint F. Moreover, for every object $C \in \mathcal{C}$, the functor q carries the unit map $u_C : C \to GFC$ to an equivalence in $\mathcal{E}$.*

(2) *There exists a functor $F : \mathcal{C} \to \mathcal{D}$ and a natural transformation $u : \mathrm{id}_{\mathcal{C}} \to G \circ F$ which exhibits F as a left adjoint to G, and has the property that $q(u)$ is the identity transformation from q to itself (in particular, $p \circ F = q$).*

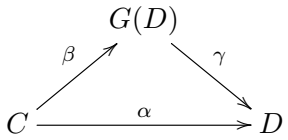
小红书
小红书号:3189205503 qq

Proof. We first construct a correspondence associated to the functor G. Let $X = \mathcal{C} \coprod_{\mathcal{D} \times \{0\}} (\mathcal{D} \times \Delta^1)$. Using the small object argument, we can construct a factorization

$$X \xrightarrow{i} \mathcal{M} \xrightarrow{r} \mathcal{E} \times \Delta^1$$

where i is inner anodyne and r is an inner fibration. Moreover, we may assume that the maps

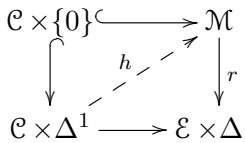
$$\mathcal{C} \to \mathcal{M} \times_{\Delta^1} \{0\}$$



$$\mathcal{D} \to \mathcal{M} \times_{\Delta^1} \{1\}$$

are isomorphisms of simplicial sets. We will henceforth identify $\mathcal{C}$ and $\mathcal{D}$ with full subcategories of $\mathcal{M}$ via these isomorphisms.

The functor G admits a left adjoint F if and only if the projection $r' : \mathcal{M} \to \Delta^1$ is a coCartesian fibration. We will show that conditions (1) and (2) Proposition 7.3.2.1 are equivalent to the existence of F, together with the following additional requirement:



(3) The projection $r'' : \mathcal{M} \to \mathcal{E}$ carries r'-coCartesian morphisms to equivalences in $\mathcal{E}$.

We will assume for the remainder of the proof that r' is a coCartesian fibration. The implications (2) $\Rightarrow$ (1) is obvious. We next prove that (1) $\Rightarrow$ (3). Let $\alpha : C \to D$ be an r'-coCartesian morphism in $\mathcal{M}$; we wish to prove that $r''(\alpha)$ is an equivalence in $\mathcal{E}$. We may assume that $C \in \mathcal{C}$ and $D \in \mathcal{D}$ (otherwise, α is itself an equivalence and the result is obvious). The map α fits into a commutative diagram

where $r''(\gamma)$ is degenerate. Consequently, to prove that $r''(\alpha)$ is an equivalence, it suffices to show that $r''(\beta) = q(\beta)$ is an equivalence. This follows from (1), since β can be identified with the unit map u_C.

We now complete the proof by showing that (3) $\Rightarrow$ (2). Assume that (3) is satisfied. We will construct a commutative diagram

with the following property: for every object $C \in \mathcal{C}$, the functor h carries $\{C\} \times \Delta^1$ to an r'-coCartesian morphism of $\mathcal{M}$. To construct β, we work simplex-by-simplex on $\mathcal{C}$. Let us first consider the case of zero-dimensional simplices. Fix an object $C \in \mathcal{C}$ and choose an r'-coCartesian

小红书
小红书号:3189205503 qq

morphism $\alpha : C \to D$ in $\mathcal{M}$. Assumption (3) guarantees that $r''(\alpha)$ is an equivalence in $\mathcal{E}$, so there exists a commutative diagram σ :

$$\begin{array}{ccc} & r''(D) & \\ {\scriptstyle r''(\alpha)}\nearrow & & \searrow{\scriptstyle \beta} \\ r''(C) & \xrightarrow{\mathrm{id}} & r''(C) \end{array}$$

in the ∞-category $\mathcal{E}$. Since p is a categorical fibration, we can lift β to an equivalence $\overline{\beta} : D \to D'$ in $\mathcal{D}$. Since r is an inner fibration, we can further lift σ to a 2-simplex

$$\begin{array}{ccc} & D & \\ {\scriptstyle \alpha}\nearrow & & \searrow{\scriptstyle \overline{\beta}} \\ C & \xrightarrow{\gamma} & D'. \end{array}$$

in $\mathcal{M}$. Since $\overline{\beta}$ is an equivalence, the map γ is equivalent to α and therefore r'-coCartesian; we can therefore define the restriction $h|(\{C\} \times \Delta^1)$ to coincide with γ.

To handle simplices of larger dimension, we need to solve mapping problems of the form

$$\begin{array}{ccc} (\Delta^n \times \{0\}) \coprod_{\partial \Delta^n \times \{0\}} (\partial \Delta^n \times \Delta^1) & \xrightarrow{j} & \mathcal{M} \\ \downarrow & \nearrow & \downarrow{\scriptstyle r} \\ \Delta^n \times \Delta^1 & \longrightarrow & \mathcal{E} \times \Delta^1, \end{array}$$

where $n > 0$ and the map j carries $\{0\} \times \Delta^1$ to an r'-coCartesian morphism in $\mathcal{M}$. Note that condition (3) guarantees that any r'-coCartesian morphism in $\mathcal{M}$ is also r-coCartesian (Proposition HTT.2.4.1.3). The existence of the required extension now follows from Proposition HTT.2.4.1.8 .

We now define $F : \mathcal{C} \to \mathcal{D}$ to be the restriction of h to $\mathcal{C} \times \{1\}$. Together with the evident inclusion $\mathcal{D} \times \Delta^1 \hookrightarrow \mathcal{M}$, the map h determines a commutative diagram

$$\begin{array}{ccc} & G \circ F & \\ {\scriptstyle u}\nearrow & & \searrow{\scriptstyle h'} \\ \mathrm{id}_{\mathcal{C}} & \xrightarrow{h} & F \end{array}$$

in the ∞-category $\mathrm{Fun}_{\mathcal{E}}(\mathcal{C}, \mathcal{M})$. The natural transformation h' is evidently r'-coCartesian; using Proposition HTT.2.4.1.3 we deduce that h' is r-coCartesian so that there exists a dotted arrow u as indicated in the diagram, thereby proving that condition (2) is satisfied. □

Definition 7.3.2.2. Suppose we are given a commutative diagram of ∞-categories

$$\begin{array}{ccc} \mathcal{C} & \xleftarrow{G} & \mathcal{D} \\ & {\scriptstyle q}\searrow \quad \swarrow{\scriptstyle p} & \\ & \mathcal{E}, & \end{array}$$

小红书
小红书号:3189205503 qq

where p and q are categorical fibrations. We will say that G *admits a left adjoint relative to* $\mathcal{E}$ if the equivalent conditions of Proposition 7.3.2.1 are satisfied.

Remark 7.3.2.3. In the situation of Proposition 7.3.2.1, if F and $u : \mathrm{id}_{\mathcal{C}} \to G \circ F$ are as in condition (2), then we will say that u is the *unit for an adjunction between* F *and* G *relative to* $\mathcal{E}$, or that u *exhibits* F *as a left adjoint of* G *relative to* $\mathcal{E}$.

Remark 7.3.2.4. Given a commutative diagram

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{F} & \mathcal{D} \\ & {\scriptstyle q} \searrow \quad \swarrow {\scriptstyle p} & \\ & \mathcal{E}, & \end{array}$$

we can define an evident dual condition that F *admit a right adjoint* G *relative to* $\mathcal{E}$. In this case, the functor G a left adjoint relative to $\mathcal{E}$. Indeed, we claim that for every object $C \in \mathcal{C}$, the functor q carries the unit map $u : C \to (G \circ F)(C)$ to an equivalence in $\mathcal{E}$. To prove this, it suffices to show that p carries $F(u)$ to an equivalence in $\mathcal{E}$. But the map $F(u)$ fits into a commutative diagram

$$\begin{array}{ccccc} & & (F \circ G \circ F)(C) & & \\ & {\scriptstyle F(u)} \nearrow & & \searrow {\scriptstyle v} & \\ F(C) & & \xrightarrow{\mathrm{id}_{F(C)}} & & F(C). \end{array}$$

By a two-out-of-three argument, it suffices to show that $p(\mathrm{id}_{F(C)})$ is an equivalence in $\mathcal{E}$ (which is obvious) and that $p(v)$ is an equivalence in $\mathcal{E}$ (which follows from our assumption that F admits a right adjoint relative to G).

Proposition 7.3.2.5. *Suppose we are given a commutative diagram*

$$\begin{array}{ccc} \mathcal{C} & \xleftarrow{G} & \mathcal{D} \\ & {\scriptstyle q} \searrow \quad \swarrow {\scriptstyle p} & \\ & \mathcal{E} & \end{array}$$

of ∞*-categories, where the maps* p *and* q *are categorical fibrations. Let* $F : \mathcal{C} \to \mathcal{D}$ *be a functor with* $pF = q$ *and* $u : \mathrm{id}_{\mathcal{C}} \to G \circ F$ *a natural transformation which exhibits* F *as a left adjoint of* G *relative to* $\mathcal{E}$. *Then, for every functor* $\mathcal{E}' \to \mathcal{E}$, *if we let* $F' : \mathcal{C} \times_{\mathcal{E}} \mathcal{E}' \to \mathcal{D} \times_{\mathcal{E}} \mathcal{E}'$ *and* $G' : \mathcal{D} \times_{\mathcal{E}} \mathcal{E}' \to \mathcal{C} \times_{\mathcal{E}} \mathcal{E}'$ *denote the induced functors and* $u' : \mathrm{id} \to G' \circ F'$ *the induced natural transformation, then* u' *exhibits* F' *as a left adjoint to* G' *relative to* $\mathcal{E}'$. *In particular, for every object* $E \in \mathcal{E}$, *the induced natural transformation* $u_E : \mathrm{id}_{\mathcal{C}_E} \to G_E \circ F_E$ *is the unit of an adjunction between the* ∞*-categories* $\mathcal{C}_E$ *and* $\mathcal{D}_E$.

小红书
小红书号:3189205503 qq

Proof. Fix objects $C' \in \mathcal{C} \times_{\mathcal{E}} \mathcal{E}'$ and $D' \in \mathcal{D} \times_{\mathcal{E}} \mathcal{E}'$ having images $C \in \mathcal{C}$ and $D \in \mathcal{D}$. Let E'_0 and E'_1 denote the images of C' and D' in $\mathcal{E}'$, and let E_0 and E_1 denote their images in $\mathcal{E}$. We wish to prove that the composite map

$$\mathrm{Map}_{\mathcal{D} \times_{\mathcal{E}} \mathcal{E}'}(F'(C'), D') \to \mathrm{Map}_{\mathcal{C} \times_{\mathcal{E}} \mathcal{E}'}((G' \circ F')(C'), G'(D')) \xrightarrow{u'} \mathrm{Map}_{\mathcal{C} \times_{\mathcal{E}} \mathcal{E}'}(C', G'(D'))$$

is a homotopy equivalence. This map fits into a homotopy coherent diagram

$$\begin{array}{ccccc} \mathrm{Map}_{\mathcal{D} \times_{\mathcal{E}} \mathcal{E}'}(F'(C'), D') & \longrightarrow & \mathrm{Map}_{\mathcal{C} \times_{\mathcal{E}} \mathcal{E}'}(C', G'(D')) & \longrightarrow & \mathrm{Map}_{\mathcal{E}'}(E'_0, E'_1) \\ \downarrow & & \downarrow & & \downarrow \\ \mathrm{Map}_{\mathcal{D}}(F(C), D) & \xrightarrow{\phi} & \mathrm{Map}_{\mathcal{C}}(C, G(D)) & \longrightarrow & \mathrm{Map}_{\mathcal{E}}(E_0, E_1). \end{array}$$

The right square and the outer rectangle are homotopy pullback diagrams, so that the left square is also a homotopy pullback diagram. It therefore suffices to show that the map ϕ is a homotopy equivalence, which follows from our assumption that u is the unit of an adjunction between F and G. □

We now establish some useful criteria for establishing the existence of relative adjoints.

Proposition 7.3.2.6. *Suppose given a commutative diagram*

$$\begin{array}{ccc} \mathcal{C} & \xleftarrow{G} & \mathcal{D} \\ & {\scriptstyle q} \searrow \quad \swarrow {\scriptstyle p} & \\ & \mathcal{E} & \end{array}$$

of ∞-categories, where p and q are locally Cartesian categorical fibrations. Then G admits a left adjoint relative to $\mathcal{E}$ if and only if the following conditions are satisfied:

(1) *For every object $E \in \mathcal{E}$, the induced map of fibers $G_E : \mathcal{D}_E \to \mathcal{C}_E$ admits a left adjoint.*

(2) *The functor G carries locally p-Cartesian morphisms in $\mathcal{D}$ to locally q-Cartesian morphisms in $\mathcal{C}$.*

Proof. Suppose first that $u : \mathrm{id}_{\mathcal{C}} \to G \circ F$ exhibits $F : \mathcal{C} \to \mathcal{D}$ as a left adjoint to G relative to $\mathcal{E}$. Proposition 7.3.2.5 implies that condition (1) is satisfied. To prove (2), let $\alpha : D \to D'$ be a locally p-Cartesian morphism in $\mathcal{D}$; we wish to prove that $G(\alpha)$ is locally q-Cartesian. The map $p(\alpha)$ determines a 1-simplex $\Delta^1 \to \mathcal{E}$. Replacing $\mathcal{C}$ and $\mathcal{D}$ by their pullbacks $\mathcal{C} \times_{\mathcal{E}} \Delta^1$ and $\mathcal{D} \times_{\mathcal{E}} \Delta^1$ (and invoking Proposition 7.3.2.5 once more), we can reduce to the case where $\mathcal{E} = \Delta^1$. Let $C \in \mathcal{C} \times_{\Delta^1} \{0\}$; we wish to prove that composition with $G(\alpha)$ induces a homotopy equivalence

$$\mathrm{Map}_{\mathcal{C}}(C, G(D)) \to \mathrm{Map}_{\mathcal{C}}(C, G(D')).$$

小红书
小红书号:3189205503 qq

This is equivalent to the requirement that composition with α induce a homotopy equivalence

$$\mathrm{Map}_{\mathcal{D}}(F(C), D) \to \mathrm{Map}_{\mathcal{D}}(F(C), D'),$$

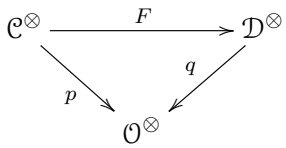
which follows from the observation that $F(C) \in \mathcal{D} \times_{\Delta^1} \{0\}$ (since α is assumed to be locally p-coCartesian).

Now suppose that (1) and (2) are satisfied. We will prove that G satisfies the first criterion of Proposition 7.3.2.1. In other words, we must show that for each $C \in \mathcal{C}$, there exists an object $D \in \mathcal{D}$ and a map $u : C \to G(D)$ satisfying the following pair of conditions:

(i) For every object $D' \in \mathcal{D}$, composition with u induces an equivalence

$$\mathrm{Map}_{\mathcal{D}}(D, D') \to \mathrm{Map}_{\mathcal{C}}(C, G(D')).$$

(ii) The morphism $q(u)$ is an equivalence in $\mathcal{E}$.



To construct u, we let E denote the image of the object C in the ∞-category $\mathcal{E}$. Assumption (1) implies that $G_E : \mathcal{D}_E \to \mathcal{C}_E$ admits a left adjoint F_E. In particular, there exists an object $D = F_E(C) \in \mathcal{D}_E$ and a morphism $u : C \to G(D)$ in $\mathcal{C}_E$ which satisfies the following modified version of condition (i):

(i') For every object $D' \in \mathcal{D}_E$, composition with u induces an equivalence

$$\mathrm{Map}_{\mathcal{D}_E}(D, D') \to \mathrm{Map}_{\mathcal{C}_E}(C, G(D')).$$

It is obvious that u satisfies condition (ii). We will prove that condition (i) is satisfied. Let $D' \in \mathcal{D}$ be arbitrary: we wish to prove that the map $\phi : \mathrm{Map}_{\mathcal{D}}(D, D') \to \mathrm{Map}_{\mathcal{C}}(C, G(D'))$ is a homotopy equivalence. Let E' denote the image of D' in $\mathcal{E}$. It will suffice to show that ϕ induces a homotopy equivalence after passing to the homotopy fiber over any point $\alpha \in \mathrm{Map}_{\mathcal{E}}(E, E')$. Choose a locally p-coCartesian morphism $D'' \to D'$ in $\mathcal{D}$ lying over α. Condition (2) guarantees that the induced map $G(D'') \to G(D')$ is locally q-Cartesian. Using Proposition HTT.2.4.4.2 , we can identify the map of homotopy fibers ϕ_α with the map $\mathrm{Map}_{\mathcal{D}_E}(D, D'') \to \mathrm{Map}_{\mathcal{C}_E}(C, G(D''))$, which is a homotopy equivalence by virtue of (i'). □

Corollary 7.3.2.7. *Suppose we are given a commutative diagram*

of ∞-operads, where p and q are coCartesian fibrations. Assume that, for every object $X \in \mathcal{O}$, the induced map of fibers $F_X : \mathcal{C}_X \to \mathcal{D}_X$ admits a right adjoint G_X. Then F admits a right adjoint G relative to $\mathcal{O}^{\otimes}$. Moreover, G is a map of ∞-operads.

小红书
小红书号:3189205503 qq

Proof. Let $X \in \mathcal{O}^{\otimes}_{\langle n \rangle}$, and choose inert morphisms $X \to X_i$ covering the maps $\rho^i : \langle n \rangle \to \langle 1 \rangle$ for $1 \leq i \leq n$. Then the induced map F_X is homotopic to the composition

$$\mathcal{C}_X \simeq \prod_{1 \leq i \leq n} \mathcal{C}_{X_i} \overset{\prod F_{X_i}}{\to} \prod_{1 \leq i \leq n} \mathcal{D}_{X_i} \simeq \mathcal{D}_X .$$

It follows that F_X admits a right adjoint G_X, given by the product of the right adjoints G_{X_i} to the functors F_{X_i}. Applying the dual version of Proposition 7.3.2.6, we deduce that F admits a right adjoint G relative to $\mathcal{O}^{\otimes}$. The description of G_X given above shows that G carries inert morphisms of $\mathcal{D}^{\otimes}$ to inert morphisms of $\mathcal{C}^{\otimes}$. □

Example 7.3.2.8. Let $\mathcal{C}^{\otimes}$ be a monoidal ∞-category, let $\mathcal{M}$ and $\mathcal{N}$ be ∞-categories left tensored over $\mathcal{C}$, let $F \in \mathrm{LinFun}_{\mathcal{C}}(\mathcal{M}, \mathcal{N})$, and let $f : \mathcal{M} \to \mathcal{N}$ be the functor underlying F. The action of $\mathcal{C}$ on $\mathcal{M}$ and $\mathcal{N}$ can be encoded by coCartesian fibrations of ∞-operads $\mathcal{M}^{\otimes} \to \mathcal{LM}^{\otimes} \leftarrow \mathcal{N}^{\otimes}$, and F determines an $\mathcal{LM}$-monoidal functor $F^{\otimes} : \mathcal{M}^{\otimes} \to \mathcal{N}^{\otimes}$. Suppose that f admits a right adjoint g. Corollary 7.3.2.7 implies that $F^{\otimes}$ admits a right adjoint $G^{\otimes}$ relative to $\mathcal{LM}^{\otimes}$, and that $G^{\otimes}$ is a map of ∞-operads. It follows that $F^{\otimes}$ and $G^{\otimes}$ induce adjoint functors

$$\mathrm{LMod}(\mathcal{M}) \underset{\psi}{\overset{\phi}{\rightleftarrows}} \mathrm{LMod}(\mathcal{N}).$$

such that the diagram

$$\begin{array}{ccc} \mathrm{LMod}(\mathcal{M}) & \xleftarrow{\psi} & \mathrm{LMod}(\mathcal{N}) \\ \downarrow & & \downarrow \\ \mathcal{M} & \xleftarrow[g]{} & \mathcal{N} \end{array}$$

commutes up to (canonical) homotopy. The adjunction between ϕ and ψ is relative to the ∞-category $\mathrm{Alg}(\mathcal{C})$. In particular, for every algebra object $A \in \mathrm{Alg}(\mathcal{C})$ we obtain adjoint functors

$$\mathrm{LMod}_A(\mathcal{M}) \underset{\psi_A}{\overset{\phi_A}{\rightleftarrows}} \mathrm{LMod}_A(\mathcal{N}).$$

Remark 7.3.2.9. In the situation of Example 7.3.2.8, suppose that $C \in \mathcal{C}$ and $N \in \mathcal{N}$. The counit map $F(G(N)) \to N$ induces a map

$$F(C \otimes G(N)) \simeq C \otimes F(G(N)) \to C \otimes N$$

which is adjoint to a map $C \otimes G(N) \to G(C \otimes N)$. If this map is an equivalence for every pair $(C, N) \in \mathcal{C} \times \mathcal{N}$, then the functor $G^{\otimes}$ is an $\mathcal{LM}$-monoidal functor: that is, we can regard G as a $\mathcal{C}$-linear functor from $\mathcal{N}$ to $\mathcal{M}$. Moreover, the unit and counit maps

$$u : \mathrm{id}_{\mathcal{M}} \to G \circ F \qquad v : F \circ G \to \mathrm{id}_{\mathcal{N}}$$

can be promoted to $\mathcal{C}$-linear natural transformations.

小红书
小红书号:3189205503 qq

Example 7.3.2.10. Let $\mathcal{C}$ be an ∞-category, let $\mathcal{C}_0 \subseteq \mathcal{C}$. Let T be a monad on $\mathcal{C}$, and suppose that the action of T carries $\mathcal{C}_0$ to itself. Let $\mathrm{Fun}_0(\mathcal{C},\mathcal{C})$ be the full subcategory of $\mathrm{Fun}(\mathcal{C},\mathcal{C})$ spanned by those functors U such that $U(\mathcal{C}_0) \subseteq \mathcal{C}_0$. Then $\mathrm{Fun}_0(\mathcal{C},\mathcal{C})$ is stable under composition, and therefore inherits a monoidal structure from the monoidal structure on $\mathrm{Fun}(\mathcal{C},\mathcal{C})$ (see §2.2.1). Then T is an algebra object of $\mathrm{Fun}_0(\mathcal{C},\mathcal{C})$, so that T determines a monad on $\mathcal{C}_0$ (which we will also denote by T) via the evident monoidal functor $\mathrm{Fun}_0(\mathcal{C},\mathcal{C}) \to \mathrm{Fun}(\mathcal{C}_0,\mathcal{C}_0)$. The inclusion $\mathcal{C}_0 \hookrightarrow \mathcal{C}$ is $\mathrm{Fun}_0(\mathcal{C},\mathcal{C})$-linear, and therefore induces a fully faithful embedding $\mathrm{Mod}_T(\mathcal{C}_0) \to \mathrm{Mod}_T(\mathcal{C})$ (whose essential image is the full subcategory $\mathcal{C}_0 \times_{\mathcal{C}} \mathrm{Mod}_T(\mathcal{C}) \subseteq \mathrm{Mod}_T(\mathcal{C})$). Suppose that the inclusion $\mathcal{C}_0 \subseteq \mathcal{C}$ admits a right adjoint g. It then follows from Example 7.3.2.8 that the inclusion $\mathrm{Mod}_T(\mathcal{C}_0) \to \mathrm{Mod}_T(\mathcal{C})$ admits a right adjoint G, and that the diagram

$$\begin{array}{ccc} \mathrm{Mod}_T(\mathcal{C}_0) & \xleftarrow{G} & \mathrm{Mod}_T(\mathcal{C}) \\ \downarrow & & \downarrow \\ \mathcal{C}_0 & \xleftarrow{g} & \mathcal{C} \end{array}$$

commutes up to canonical homotopy.

There is a similar criterion for detecting the existence of relative left adjoints in the setting of locally coCartesian fibrations:

Proposition 7.3.2.11. *Suppose we are given a commutative diagram of ∞-categories*

$$\begin{array}{ccc} \mathcal{C} & \xleftarrow{G} & \mathcal{D} \\ & {\scriptstyle q} \searrow \quad \swarrow {\scriptstyle p} & \\ & \mathcal{E} & \end{array}$$

where p and q are locally coCartesian categorical fibrations. Then G admits a left adjoint relative to $\mathcal{E}$ if and only if the following conditions are satisfied:

(1) *For each object $E \in \mathcal{E}$, the induced map $G_E : \mathcal{D}_E \to \mathcal{C}_E$ admits a left adjoint F_E.*

(2) *Let $C \in \mathcal{C}$ be an object and let $\alpha : E \to E'$ be a morphism in $\mathcal{E}$, where $E = q(C)$. Let $\overline{\alpha} : F_E(C) \to D$ be a locally p-coCartesian morphism in $\mathcal{D}$ lying over α, and let $\beta : C \to G(D)$ be the composition of the unit map $C \to (G \circ F_E)(C)$ with $G(\beta)$. Choose a factorization of β as a composition*

$$C \xrightarrow{\beta'} C' \xrightarrow{\beta''} G(D)$$

where β' is a locally q-coCartesian morphism lifting α and β'' is a morphism in $\mathcal{C}_{E'}$. Then β'' induces an equivalence $F_{E'}(C') \to D$ in the ∞-category $\mathcal{D}_{E'}$.

Proof. Suppose first that $u : \mathrm{id}_{\mathcal{C}} \to G \circ F$ exhibits $F : \mathcal{C} \to \mathcal{D}$ as a left adjoint to G relative to $\mathcal{E}$. Proposition 7.3.2.5 implies that condition (1) is satisfied. In the situation of condition

小红书 小红书号:3189205503 qq

(2), we can identify F_E and $F_{E'}$ with the restrictions of F. Under these identifications, the map $\phi : F_{E'}(C') \to D$ adjoint to β'' fits into a commutative diagram

$$\begin{array}{ccc} & F(C) & \\ {\scriptstyle F(\beta')}\swarrow & & \searrow{\scriptstyle \overline{\alpha}} \\ F(C') & \xrightarrow{\phi} & D. \end{array}$$

Consequently, ϕ is an equivalence if and only if $F(\beta')$ is locally p-coCartesian. We now complete the proof by observing that F admits a right adjoint relative to $\mathcal{E}$ (Remark 7.3.2.4) and therefore carries locally q-coCartesian morphisms in $\mathcal{C}$ to locally p-coCartesian morphisms in $\mathcal{D}$ (apply Proposition 7.3.2.6 after passing to opposite ∞-categories).

Conversely, suppose that conditions (1) and (2) are satisfied. The argument proceeds as in the proof of Proposition 7.3.2.6. We must show that for each $C \in \mathcal{C}$, there exists an object $D \in \mathcal{D}$ and a map $u : C \to G(D)$ satisfying the following pair of conditions:

(i) For every object $D' \in \mathcal{D}$, composition with u induces an equivalence

$$\mathrm{Map}_{\mathcal{D}}(D, D') \to \mathrm{Map}_{\mathcal{C}}(C, G(D')).$$

(ii) The morphism $q(u)$ is an equivalence in $\mathcal{E}$.

To construct u, we let E denote the image of the object C in the ∞-category $\mathcal{E}$. Assumption (1) implies that $G_E : \mathcal{D}_E \to \mathcal{C}_E$ admits a left adjoint F_E. In particular, there exists an object $D = F_E(C) \in \mathcal{D}_E$ and a morphism $u : C \to G(D)$ in $\mathcal{C}_E$ which satisfies the following modified version of condition (i):

(i') For every object $D' \in \mathcal{D}_E$, composition with u induces an equivalence

$$\mathrm{Map}_{\mathcal{D}_E}(D, D') \to \mathrm{Map}_{\mathcal{C}_E}(C, G(D')).$$

It is obvious that u satisfies condition (ii). We will complete the proof by showing that u satisfies (i). Let $D' \in \mathcal{D}$ be arbitrary: we wish to prove that the map $\phi : \mathrm{Map}_{\mathcal{D}}(D, D') \to \mathrm{Map}_{\mathcal{C}}(C, G(D'))$ is a homotopy equivalence. Let E' denote the image of D' in $\mathcal{E}$. It will suffice to show that ϕ induces a homotopy equivalence after passing to the homotopy fiber over any point $\alpha \in \mathrm{Map}_{\mathcal{E}}(E, E')$. Choose a locally p-coCartesian morphism $\overline{\alpha} : D \to D''$ lying over α, and factor the composition $\beta : C \to G(D) \to G(D'')$ as a composition

$$C \xrightarrow{\beta'} C' \xrightarrow{\beta''} G(D'')$$

where β' is a locally q-coCartesian lift of α and β'' is a morphism in $\mathcal{C}_{E'}$. Using Proposition HTT.2.4.4.2 , we can identify the homotopy fiber ϕ_α with the induced map

$$\mathrm{Map}_{\mathcal{D}_{E'}}(D'', D') \longrightarrow \mathrm{Map}_{\mathcal{C}_{E'}}(G(D''), G(D')) \xrightarrow{\circ \beta''} \mathrm{Map}_{\mathcal{C}_{E'}}(C', G(D')).$$

小红书
小红书号:3189205503 qq

Identifying the latter space with $\mathrm{Map}_{\mathcal{D}_{E'}}(F_{E'}(C'), D')$, we see that the map ϕ_α is induced by composition with the map $F_{E'}(C') \to D''$ adjoint to β'', which is an equivalence by virtue of (2). □

Corollary 7.3.2.12. *Suppose we are given a commutative diagram*

$$\begin{array}{ccc} \mathcal{C}^{\otimes} & \xleftarrow{G} & \mathcal{D}^{\otimes} \\ & {\scriptstyle p}\searrow \quad \swarrow{\scriptstyle q} & \\ & \mathcal{O}^{\otimes} & \end{array}$$

of ∞-operads, where p and q are coCartesian fibrations. Assume that:

(1) *For every object $X \in \mathcal{O}$, the induced map of fibers $G_X : \mathcal{D}_X \to \mathcal{C}_X$ admits a left adjoint F_X.*

(2) *For every operation $\phi \in \mathrm{Mul}_{\mathcal{O}}(\{X_i\}_{i \in I}, Y)$ in $\mathcal{O}^{\otimes}$, if we let $\phi^{\mathcal{C}}_!$ and $\phi^{\mathcal{D}}_!$ denote the associated functors*

$$\prod_{i \in I} \mathcal{C}_{X_i} \to \mathcal{C}_Y \qquad \prod_{i \in I} \mathcal{D}_{X_i} \to \mathcal{D}_Y,$$

then the evident natural transformation

$$F_Y \circ \phi^{\mathcal{C}}_! \to \phi^{\mathcal{D}}_! \circ (\prod_{i \in I} F_{X_i})$$

is an equivalence of functors from $\prod_i \mathcal{C}_{X_i}$ to $\mathcal{D}_Y$.

Then G admits a left adjoint F relative to $\mathcal{O}^{\otimes}$. Moreover, F is a $\mathcal{O}^{\otimes}$-monoidal functor.

Proof. The existence of F follows from Proposition 7.3.2.11. Using Proposition 7.3.2.6, we deduce that F carries p-coCartesian morphisms in $\mathcal{C}^{\otimes}$ to q-coCartesian morphisms in $\mathcal{D}^{\otimes}$ and is therefore a $\mathcal{O}$-monoidal functor. □

Remark 7.3.2.13. In the situation of Corollary 7.3.2.12, Proposition 7.3.2.5 implies that F and G induce adjoint functors $\mathrm{Alg}_{/\mathcal{O}}(\mathcal{C}) \rightleftarrows \mathrm{Alg}_{/\mathcal{O}}\mathcal{D}$.

We now apply the theory of relative adjunctions to the study of tangent bundles.

Definition 7.3.2.14. Let $\mathcal{C}$ be a presentable ∞-category, and consider the associated diagram

$$\begin{array}{ccc} T_{\mathcal{C}} & \xrightarrow{G} & \mathrm{Fun}(\Delta^1, \mathcal{C}) \\ & {\scriptstyle p}\searrow \quad \swarrow{\scriptstyle q} & \\ & \mathcal{C} & \end{array}$$

where q is given by evaluation at $\{1\} \subseteq \Delta^1$. The functor G carries p-Cartesian morphisms to q-Cartesian morphisms, and for each object $A \in \mathcal{C}$ the induced map $G_A : \mathrm{Sp}(\mathcal{C}^{/A}) \to \mathcal{C}^{/A}$ admits a

小红书
小红书号:3189205503 qq

left adjoint Σ^∞. Applying Proposition 7.3.2.6, we conclude that G admits a left adjoint relative to $\mathcal{C}$, which we will denote by F. The *absolute cotangent complex functor* $L : \mathcal{C} \to T_{\mathcal{C}}$ is defined to be the composition

$$\mathcal{C} \to \mathrm{Fun}(\Delta^1, \mathcal{C}) \xrightarrow{F} T_{\mathcal{C}},$$

where the first map is given by the diagonal embedding. We will denote the value of L on an object $A \in \mathcal{C}$ by $L_A \in \mathrm{Sp}(\mathcal{C}^{/A})$, and will refer to L_A as the *cotangent complex of* A.

Remark 7.3.2.15. Let $\mathcal{C}$ be a presentable ∞-category. Since the diagonal embedding $\mathcal{C} \to \mathrm{Fun}(\Delta^1, \mathcal{C})$ is a left adjoint to the evaluation map $\mathrm{Fun}(\Delta^1, \mathcal{C}) \to \mathrm{Fun}(\{0\}, \mathcal{C}) \simeq \mathcal{C}$, we deduce that the absolute cotangent complex functor $L : \mathcal{C} \to T_{\mathcal{C}}$ is left adjoint to the composition

$$T_{\mathcal{C}} \to \mathrm{Fun}(\Delta^1, \mathcal{C}) \to \mathrm{Fun}(\{0\}, \mathcal{C}) \simeq \mathcal{C}\,.$$

Remark 7.3.2.16. The terminology of Definition 7.3.2.14 is slightly abusive, since the tangent bundle $T_{\mathcal{C}}$ and the functor L are only well-defined up to equivalence. It would perhaps be more accurate to refer to $L : \mathcal{C} \to T_{\mathcal{C}}$ as *an* absolute cotangent functor. However, L and $T_{\mathcal{C}}$ are well-defined up to a contractible space of choices, so we will tolerate the ambiguity.

Remark 7.3.2.17. Let $\mathcal{C}$ be a presentable ∞-category containing an object A. We observe that the fiber of the tangent bundle $T_{\mathcal{C}}$ over $A \in \mathcal{C}$ can be identified with the ∞-category $\mathrm{Sp}(\mathcal{C}_{/A})$. Under this identification, the object $L_A \in \mathrm{Sp}(\mathcal{C}_{/A})$ corresponds to the image of $\mathrm{id}_A \in \mathcal{C}_{/A}$ under the suspension spectrum functor $\Sigma^\infty_+ : \mathcal{C}_{/A} \to \mathrm{Sp}(\mathcal{C}_{/A})$.

Remark 7.3.2.18. Let $\mathcal{C}$ be a presentable ∞-category. Since the cotangent complex functor L is a left adjoint, it carries colimit diagrams in $\mathcal{C}$ to colimit diagrams in $T_{\mathcal{C}}$. In view of Proposition 7.3.1.12, we see that L also carries small colimit diagrams in $\mathcal{C}$ to p-colimit diagrams in $T_{\mathcal{C}}$, where p denotes the composition

$$T_{\mathcal{C}} \to \mathrm{Fun}(\Delta^1, \mathcal{C}) \to \mathrm{Fun}(\{1\}, \mathcal{C}) \simeq \mathcal{C}\,.$$

Remark 7.3.2.19. Let $\mathcal{C}$ be a presentable ∞-category, and let A be an initial object of $\mathcal{C}$. Using Remark 7.3.2.18, we deduce that L_A is an initial object of the tangent bundle $T_{\mathcal{C}}$. Equivalently, L_A is a zero object of the stable ∞-category $\mathrm{Sp}(\mathcal{C}^{/A})$.

7.3.3 The Relative Cotangent Complex

Let $\mathcal{C}$ be a presentable ∞-category. In §7.3.2, we defined the absolute cotangent complex functor $L : \mathcal{C} \to T_{\mathcal{C}}$, which associates to each $A \in \mathcal{C}$ an object $L_A \in \mathrm{Sp}(\mathcal{C}^{/A})$. For many applications, it is convenient to consider also a *relative cotangent complex* associated to a morphism $f : A \to B$ in $\mathcal{C}$. In this section, we will define the relative cotangent complex $L_{B/A}$ and establish some of its basic properties.

小红书
小红书号:3189205503 qq

Definition 7.3.3.1. Let $\mathcal{C}$ be a presentable ∞-category and let $p : T_{\mathcal{C}} \to \mathcal{C}$ be a tangent bundle to $\mathcal{C}$. A *relative cofiber sequence* in $T_{\mathcal{C}}$ is a diagram σ:

$$\begin{array}{ccc} X & \longrightarrow & Y \\ \downarrow & & \downarrow \\ 0 & \longrightarrow & Z \end{array}$$

in $T_{\mathcal{C}}$ with the following properties:

(1) The map $p \circ \sigma$ factors through the projection $\Delta^1 \times \Delta^1 \to \Delta^1$, so that the vertical arrows above become degenerate in $\mathcal{C}$.

(2) The diagram σ is a pushout square. (Since condition (1) implies that $p \circ \sigma$ is a pushout square, this is equivalent to the requirement that σ be a p-colimit diagram; see Proposition 7.3.1.12).

Let $\mathcal{E}$ denote the full subcategory of

$$\mathrm{Fun}(\Delta^1 \times \Delta^1, T_{\mathcal{C}}) \times_{\mathrm{Fun}(\Delta^1 \times \Delta^1, \mathcal{C})} \mathrm{Fun}(\Delta^1, \mathcal{C})$$

spanned by the relative cofiber sequences. There is an evident forgetful functor $\psi : \mathcal{E} \to \mathrm{Fun}(\Delta^1, T_{\mathcal{C}})$, given by restriction to the upper half of the diagram. Invoking Proposition HTT.4.3.2.15 twice, we deduce that ψ is a trivial Kan fibration.

The *relative cotangent complex functor* is defined to be the composition

$$\mathrm{Fun}(\Delta^1, \mathcal{C}) \xrightarrow{L} \mathrm{Fun}(\Delta^1, T_{\mathcal{C}}) \xrightarrow{s} \mathcal{E} \xrightarrow{s'} T_{\mathcal{C}},$$

where s is a section of ψ and s' is given by evaluation at the vertex $\{1\} \times \{1\} \subseteq \Delta^1 \times \Delta^1$.

We will denote the image of a morphism $f : A \to B$ under the relative cotangent complex functor by $L_{B/A} \in T_{\mathcal{C}} \times_{\mathcal{C}} \{B\} \simeq \mathrm{Sp}(\mathcal{C}^{B/})$.

Remark 7.3.3.2. Let $\mathcal{C}$ and $p : T_{\mathcal{C}} \to \mathcal{C}$ be as in Definition 7.3.3.1. By definition, the relative cotangent complex of a morphism $f : A \to B$ fits into a relative cofiber sequence

$$\begin{array}{ccc} L_A & \longrightarrow & L_B \\ \downarrow & & \downarrow \\ 0 & \longrightarrow & L_{B/A} \end{array}$$

in the ∞-category $T_{\mathcal{C}}$. Using Proposition HTT.4.3.1.9 , we deduce the existence of a cofiber sequence

$$f_! L_A \to L_B \to L_{B/A}$$

in the stable ∞-category $\mathrm{Sp}(\mathcal{C}^{/B}) \simeq T_{\mathcal{C}} \times_{\mathcal{C}} \{B\}$; here $f_! : \mathrm{Sp}(\mathcal{C}^{/A}) \to \mathrm{Sp}(\mathcal{C}^{/B})$ denotes the functor induced by the coCartesian fibration p.

小红书 小红书号:3189205503 qq

Remark 7.3.3.3. Let $\mathcal{C}$ be a presentable ∞-category containing a morphism $f : A \to B$. If A is an initial object of $\mathcal{C}$, then the canonical map $L_B \to L_{B/A}$ is an equivalence. This follows immediately from Remark 7.3.3.2, since the absolute cotangent complex L_A vanishes (Remark 7.3.2.19). We will sometimes invoke this equivalence implicitly, and ignore the distinction between the relative cotangent complex $L_{B/A}$ and the absolute cotangent complex L_B.

Remark 7.3.3.4. Let $\mathcal{C}$ be a presentable ∞-category containing a morphism $f : A \to B$. If f is an equivalence, then the relative cotangent complex $L_{B/A}$ is a zero object of $\mathrm{Sp}(\mathcal{C}^{/B})$. This follows immediately from Remark 7.3.3.2.

We next study the fiber sequence of cotangent complexes associated to a triple of morphisms $A \to B \to C$.

Proposition 7.3.3.5. *Let $\mathcal{C}$ be a presentable ∞-category, let $T_{\mathcal{C}}$ be a tangent bundle to $\mathcal{C}$. Suppose given a commutative diagram*

$$\begin{array}{ccc} & B & \\ \nearrow & & \searrow \\ A & \longrightarrow & C \end{array}$$

in $\mathcal{C}$. The resulting square

$$\begin{array}{ccc} L_{B/A} & \xrightarrow{f} & L_{C/A} \\ \downarrow & & \downarrow \\ L_{B/B} & \longrightarrow & L_{C/B} \end{array}$$

is a pushout diagram in $T_{\mathcal{C}}$ (and therefore a relative cofiber sequence, in view of Remark 7.3.3.4).

Proof. We have a commutative diagram

$$\begin{array}{ccccc} L_A & \longrightarrow & L_B & \longrightarrow & L_C \\ \downarrow & & \downarrow & & \downarrow \\ L_{A/A} & \longrightarrow & L_{B/A} & \longrightarrow & L_{C/A} \\ & & \downarrow & & \downarrow \\ & & L_{B/B} & \longrightarrow & L_{C/B} \end{array}$$

in the ∞-category $T_{\mathcal{C}}$. Here $L_{A/A}$ and $L_{B/B}$ are zero objects in the fibers $\mathrm{Sp}(\mathcal{C}^{/A})$ and $\mathrm{Sp}(\mathcal{C}^{/B})$, respectively (Remark 7.3.3.4). By construction, the upper left square and both large rectangles in this diagram are coCartesian. It follows first that the upper right square is coCartesian, and then that the lower right square is coCartesian as desired. □

小红书
小红书号:3189205503 qq

Corollary 7.3.3.6. *Let $\mathcal{C}$ be a presentable ∞-category containing a commutative triangle*

$$\begin{array}{ccc} & B & \\ {\scriptstyle}\nearrow & & \searrow{\scriptstyle f} \\ A & \longrightarrow & C, \end{array}$$

and let $f_! : \mathrm{Sp}(\mathcal{C}^{/B}) \to \mathrm{Sp}(\mathcal{C}^{/C})$ denote the induced map. Then we have a canonical cofiber sequence

$$f_! L_{B/A} \to L_{C/A} \to L_{C/B}$$

in the ∞-category $\mathrm{Sp}(\mathcal{C}^{/C})$.

Our next result records the behavior of the relative cotangent complex under base change.

Proposition 7.3.3.7. *Let $\mathcal{C}$ be a presentable ∞-category, $T_{\mathcal{C}}$ a tangent bundle to $\mathcal{C}$, and p the composite map*

$$T_{\mathcal{C}} \to \mathrm{Fun}(\Delta^1, \mathcal{C}) \to \mathrm{Fun}(\{1\}, \mathcal{C}) \simeq \mathcal{C}\,.$$

Suppose given a pushout diagram

$$\begin{array}{ccc} A & \longrightarrow & B \\ \downarrow & & \downarrow{\scriptstyle f} \\ A' & \longrightarrow & B' \end{array}$$

in $\mathcal{C}$. Then the induced map $\beta : L_{B/A} \to L_{B'/A'}$ is a p-coCartesian morphism in $T_{\mathcal{C}}$.

Proof. Using Definition 7.3.3.1, we deduce the existence of a map between relative cofiber sequences in $T_{\mathcal{C}}$, which we can depict as a cubical diagram τ:

$$\begin{array}{ccccc} L_A & \longrightarrow & L_B & & \\ & \searrow & & \searrow & \\ \downarrow & & 0_A & \longrightarrow & L_{B/A} \\ & & \downarrow & & \downarrow \\ L_{A'} & \longrightarrow & L_{B'} & & \\ & \searrow & & \searrow & \\ & & 0_{A'} & \longrightarrow & L_{B'/A'}. \end{array}$$

Let $K \subseteq \Delta^1 \times \Delta^1 \times \Delta^1$ denote the full simplicial subset obtained by omitting the final vertex. Let $K_0 \subseteq K$ be obtained by omitting the vertex $v = \{1\} \times \{1\} \times \{0\}$ such that $\tau(v) = L_{B'}$, and let $K_1 \subseteq K$ be obtained by omitting the vertex $w = \{1\} \times \{0\} \times \{1\}$ such that $\tau(w) = L_{B/A}$. By

小红书号:3189205503 qq

construction, τ is a p-left Kan extension of $\tau|K_1$. Using Proposition HTT.4.3.2.8 , we conclude that τ is a p-colimit diagram.

Remark 7.3.2.18 implies that the square

$$\begin{array}{ccc} L_A & \longrightarrow & L_B \\ \downarrow & & \downarrow \\ L_{A'} & \longrightarrow & L_{B'} \end{array}$$

is a p-colimit diagram, so that $\tau|K$ is a p-left Kan extension of $\tau|K_0$. Invoking Proposition HTT.4.3.2.8 again, we deduce that τ is a p-left Kan extension of $\tau|K_0$. It follows that τ restricts to a p-colimit square:

$$\begin{array}{ccc} 0_A & \longrightarrow & L_{B/A} \\ \downarrow & & \downarrow \\ 0_{A'} & \longrightarrow & L_{B'/A'}. \end{array}$$

Proposition HTT.4.3.1.9 implies that the induced square

$$\begin{array}{ccc} 0 & \longrightarrow & f_! L_{B/A} \\ \downarrow & & \downarrow \alpha \\ 0 & \longrightarrow & L_{B'/A'} \end{array}$$

is a pushout square in $\mathrm{Sp}(\mathcal{C}^{/B'})$; in other words, the map α is an equivalence. This is simply a reformulation of the assertion that β is p-coCartesian. □

There is another way to view the relative cotangent complex: if we fix an object $A \in \mathcal{C}$, then the functor $B \mapsto L_{B/A}$ can be identified with the *absolute* cotangent complex for the ∞-category $\mathcal{C}_{A/}$. The rest of this section will be devoted to justifying this assertion. These results will not be needed elsewhere in this paper, and may be safely omitted by the reader. We begin by describing the tangent bundle to an ∞-category of the form $\mathcal{C}_{A/}$.

Proposition 7.3.3.8. *Let $\mathcal{C}$ be a presentable ∞-category containing an object A, and let $\mathcal{D} = \mathcal{C}_{A/}$. Let $T_{\mathcal{C}}$ and $T_{\mathcal{D}}$ denote tangent bundles to $\mathcal{C}$ and $\mathcal{D}$, respectively. Then there is a canonical equivalence*

$$T_{\mathcal{D}} \simeq T_{\mathcal{C}} \times_{\mathcal{C}} \mathcal{D}$$

of presentable fibrations over $\mathcal{D}$.

Proposition 7.3.3.8 a relative version of the following more elementary observation:

小红书
小红书号:3189205503 qq

Lemma 7.3.3.9. *Let $\mathcal{C}$ be an ∞-category which admits finite limits and let A be an object of $\mathcal{C}$. The forgetful functor $\mathcal{C}_{A/} \to \mathcal{C}$ induces equivalences of ∞-categories*

$$f : (\mathcal{C}_{A/})_* \to \mathcal{C}_* \qquad g : \mathrm{Sp}(\mathcal{C}_{A/}) \to \mathrm{Sp}(\mathcal{C}).$$

Proof. We will prove that f is an equivalence; the assertion that g is an equivalence is an obvious consequence. Let 1 denote a final object of $\mathcal{C}$. Using Proposition HTT.1.2.13.8, we deduce that $\mathcal{C}_{A/}$ admits a final object, given by a morphism $u : A \to 1$. Using Lemma HTT.7.2.2.8, we deduce the existence of a commutative diagram

$$\begin{array}{ccc} \mathcal{C}_{u/} & \xrightarrow{f'} & \mathcal{C}_{1/} \\ \downarrow & & \downarrow \\ (\mathcal{C}_{A/})_* & \xrightarrow{f} & \mathcal{C}_*, \end{array}$$

where the vertical arrows are equivalences. It follows that f is an equivalence if and only if f' is an equivalence. But f is a trivial Kan fibration, since the inclusion $\{1\} \subseteq \Delta^1$ is right anodyne. $\square$

Proof of Proposition 7.3.3.8. Let $\mathcal{E} = \mathrm{Fun}(\Delta^1, \mathcal{C}) \times_{\mathrm{Fun}(\{1\},\mathcal{C})} \mathcal{D}$, so that we have a commutative diagram

$$\begin{array}{ccc} \mathrm{Fun}(\Delta^1, \mathcal{D}) & \xrightarrow{f} & \mathcal{E} \\ & {\scriptstyle q} \searrow \quad \swarrow {\scriptstyle q'} & \\ & \mathcal{D}, & \end{array}$$

where q and q' are presentable fibrations. We first claim that f carries q-limit diagrams to q'-limit diagrams. In view of Propositions HTT.4.3.1.9 and HTT.4.3.1.10, it will suffice to verify the following pair of assertions:

(i) For each object $\overline{B} \in \mathcal{D}$, corresponding to a morphism $A \to B$ in $\mathcal{C}$, the induced map of fibers

$$f_{\overline{B}} : \mathcal{D}^{/\overline{B}} \to \mathcal{C}^{/B}$$

preserves limits.

(ii) The map f carries q-Cartesian morphisms to q'-Cartesian morphisms.

To prove (i), we observe that $f_{\overline{B}}$ is equivalent to the forgetful functor $(\mathcal{C}_{/B})_{A/} \to \mathcal{C}_{/B}$, which preserves limits by Proposition HTT.1.2.13.8. Assertion (ii) is equivalent to the requirement that the forgetful functor $\mathcal{D} \to \mathcal{C}$ preserves pullback diagrams, which follows again from Proposition HTT.1.2.13.8.

小红书
小红书号:3189205503 qq

Using Remark 7.3.1.3, we can identify $T_{\mathcal{C}} \times_{\mathcal{C}} \mathcal{D}$ with the stable envelope of the presentable fibration q'. It follows from the universal property of Proposition 7.3.1.7 that the map f fits into a commutative diagram

$$\begin{array}{ccc} T_{\mathcal{D}} & \xrightarrow{\overline{f}} & T_{\mathcal{C}} \times_{\mathcal{C}} \mathcal{D} \\ \downarrow & & \downarrow \\ \mathrm{Fun}(\Delta^1, \mathcal{D}) & \xrightarrow{f} & \mathcal{E}\,. \end{array}$$

To complete the proof, we will show that $\overline{f}$ is an equivalence. In view of Corollary HTT.2.4.4.4, it will suffice to show that for each $\overline{B} \in \mathcal{D}$ classifying a map $A \to B$ in $\mathcal{C}$, the induced map $\mathrm{Sp}(\mathcal{D}^{/\overline{B}}) \to \mathrm{Sp}(\mathcal{C}^{/B})$ is an equivalence of ∞-categories. This follows immediately from Lemma 7.3.3.9. □

We now wish to study the relationship between the cotangent complex functors of $\mathcal{C}$ and $\mathcal{C}_{A/}$, where A is an object of $\mathcal{C}$. For this, it is convenient to introduce a bit of terminology.

Definition 7.3.3.10. Let $F, F' : \mathcal{C} \to \mathcal{D}$ be a functors from an ∞-category $\mathcal{C}$ to an ∞-category $\mathcal{D}$, and let $\alpha : F \to F'$ be a natural transformation. We will say that α is *coCartesian* if, for every morphism $C \to C'$ in $\mathcal{C}$, the induced diagram

$$\begin{array}{ccc} F(C) & \longrightarrow & F(C') \\ \downarrow{\scriptstyle \alpha_C} & & \downarrow{\scriptstyle \alpha_{C'}} \\ F'(C) & \longrightarrow & F'(C') \end{array}$$

is a pushout square in $\mathcal{D}$.

The basic properties of the class of coCartesian natural transformations are summarized in the following lemma:

Lemma 7.3.3.11. (1) *Let $F, F', F'' : \mathcal{C} \to \mathcal{D}$ be functors between ∞-categories, and let $\alpha : F \to F'$ and $\beta : F' \to F''$ be natural transformations. If α is coCartesian, then β is coCartesian if and only if $\beta \circ \alpha$ is coCartesian.*

(2) *Let $F : \mathcal{C} \to \mathcal{D}$ be a functor between ∞-categories, let $G, G' : \mathcal{D} \to \mathcal{E}$ be a pair of functors, and let $\alpha : G \to G'$ be a natural transformation. If α is coCartesian, then so is the induced transformation $GF \to G'F$.*

(3) *Let $F, F' : \mathcal{C} \to \mathcal{D}$ be a pair of functors between ∞-categories, let $G : \mathcal{D} \to \mathcal{E}$ another functor, and let $\alpha : F \to F'$ be a natural transformation. If α is coCartesian and G preserves all pushout squares which exist in $\mathcal{D}$, then the induced transformation $GF \to GF'$ is coCartesian.*

小红书
小红书号:3189205503 qq

Definition 7.3.3.12. We will say that a commutative diagram of ∞-categories

$$\begin{array}{ccc} \mathcal{D} & \xrightarrow{H} & \mathcal{C} \\ \downarrow{\scriptstyle G} & & \downarrow{\scriptstyle G'} \\ \mathcal{D}' & \xrightarrow{H'} & \mathcal{C}' \end{array}$$

is *rectilinear* if the following conditions are satisfied:

(1) The functors G and G' admit left adjoints, which we will denote by F and F' respectively.

(2) The identity map $H'G \simeq G'H$ induces a coCartesian natural transformation $F'H' \to HF$.

Remark 7.3.3.13. The condition of being rectilinear is closely related to the condition of being *left adjointable*, as defined in §HTT.7.3.1 .

Proposition 7.3.3.14. *Let $\mathcal{C}$ be a presentable ∞-category containing an object A and let $\mathcal{D} = \mathcal{C}_{A/}$. Let $G : T_{\mathcal{C}} \to \mathcal{C}$ denote the composite map*

$$T_{\mathcal{C}} \to \mathrm{Fun}(\Delta^1, \mathcal{C}) \to \mathrm{Fun}(\{0\}, \mathcal{C}) \simeq \mathcal{C},$$

and let $G' : T_{\mathcal{D}} \to \mathcal{D}$ be defined similarly, so that we have a commutative diagram

$$\begin{array}{ccc} T_{\mathcal{D}} & \longrightarrow & T_{\mathcal{C}} \\ \downarrow & & \downarrow \\ \mathcal{D} & \longrightarrow & \mathcal{C} \end{array}$$

(see the proof of Proposition 7.3.3.8). Then the above diagram is rectilinear.

Corollary 7.3.3.15. *Let $\mathcal{C}$ and $\mathcal{D} = \mathcal{C}_{A/}$ be as in Proposition 7.3.3.14, and let $L^{\mathcal{C}} : \mathcal{C} \to T_{\mathcal{C}}$ and $L^{\mathcal{D}} : \mathcal{D} \to T_{\mathcal{D}}$ be cotangent complex functors for $\mathcal{C}$ and $\mathcal{D}$, respectively. Then:*

(1) *Let $p : \mathcal{D} \to \mathcal{C}$ be the projection, and let $q : T_{\mathcal{D}} \to T_{\mathcal{C}}$ be the induced map. Then there is a coCartesian natural transformation $L^{\mathcal{C}} \circ p \to q \circ L^{\mathcal{D}}$.*

(2) *There is a pushout diagram of functors*

$$\begin{array}{ccc} L^{\mathcal{C}}_A & \longrightarrow & L^{\mathcal{C}} \circ p \\ \downarrow & & \downarrow \\ 0 & \longrightarrow & q \circ L^{\mathcal{D}}. \end{array}$$

Here the terms in the left hand column indicate the constant functors taking the values $L^{\mathcal{C}}_A, 0 \in \mathrm{Sp}(\mathcal{C}^{/A}) \subseteq T_{\mathcal{C}}$.

小红书号:3189205503 qq

(3) *The functor $q \circ L^{\mathcal{D}} : \mathcal{D} \to T_{\mathcal{C}}$ can be identified with the functor $B \mapsto L_{B/A}$.*

Proof. Assertion (1) is merely a reformulation of Proposition 7.3.3.14. To prove (2), we let $e : \mathcal{D} \to \mathcal{D}$ denote the constant functor taking the value $\mathrm{id}_A \in \mathcal{D}$, so that we have a natural transformation $\alpha : e \to \mathrm{id}_{\mathcal{D}}$. Applying the coCartesian transformation of (1) to α yields the desired diagram, since $L^{\mathcal{D}} \circ e$ vanishes by Remark 7.3.2.19. Assertion (3) follows immediately from (2) and the definition of the relative cotangent complex. □

To prove Proposition 7.3.3.14, we observe that the square in question fits into a commutative diagram

$$\begin{array}{ccc} T_{\mathcal{D}} & \longrightarrow & T_{\mathcal{C}} \\ \downarrow & & \downarrow \\ \mathrm{Fun}(\Delta^1, \mathcal{D}) & \longrightarrow & \mathrm{Fun}(\Delta^1, \mathcal{C}) \\ \downarrow & & \downarrow \\ \mathrm{Fun}(\{0\}, \mathcal{D}) & \longrightarrow & \mathrm{Fun}(\{0\}, \mathcal{C}). \end{array}$$

It will therefore suffice to prove the following three results:

Lemma 7.3.3.16. *Suppose given a commutative diagram of ∞-categories*

$$\begin{array}{ccc} \mathcal{D} & \xrightarrow{H} & \mathcal{C} \\ \downarrow{\scriptstyle G_0} & & \downarrow{\scriptstyle G_1} \\ \mathcal{D}' & \xrightarrow{H'} & \mathcal{C}' \\ \downarrow{\scriptstyle G'_0} & & \downarrow{\scriptstyle G'_1} \\ \mathcal{D}'' & \xrightarrow{H''} & \mathcal{C}'' \end{array}$$

If the upper and lower squares are rectilinear, then the outer square is rectilinear.

Lemma 7.3.3.17. *Let $p : \mathcal{D} \to \mathcal{C}$ be a functor between ∞-categories. Then the commutative diagram*

$$\begin{array}{ccc} \mathrm{Fun}(\Delta^1, \mathcal{D}) & \longrightarrow & \mathrm{Fun}(\Delta^1, \mathcal{C}) \\ \downarrow{\scriptstyle G} & & \downarrow{\scriptstyle G'} \\ \mathrm{Fun}(\{0\}, \mathcal{D}) & \longrightarrow & \mathrm{Fun}(\{0\}, \mathcal{C}) \end{array}$$

is rectilinear.

Lemma 7.3.3.18. *Let $\mathcal{C}$ be a presentable ∞-category containing an object A, and let $\mathcal{D} = \mathcal{C}_{A/}$. Then the diagram*

$$\begin{array}{ccc} T_{\mathcal{D}} & \longrightarrow & T_{\mathcal{C}} \\ \downarrow & & \downarrow \\ \mathrm{Fun}(\Delta^1, \mathcal{D}) & \longrightarrow & \mathrm{Fun}(\Delta^1, \mathcal{C}) \end{array}$$

小红书
小红书号:3189205503 qq

(*see the proof of Proposition 7.3.3.8*) *is rectilinear.*

Proof of Lemma 7.3.3.16. We observe that $G_1 G_0$ admits a left adjoint $L_0 L_1$, where L_0 and L_1 are left adjoints to G_0 and G_1, respectively. Similarly, $G_1' G_0'$ admits a left adjoint $L_0' L_1'$. It remains only to show that the composite transformation

$$L_0 L_1 H'' \to L_0 H' L_1' \to H L_0' L_1'$$

is coCartesian, which follows from Lemma 7.3.3.11. □

Proof of Lemma 7.3.3.17. For any ∞-category $\mathcal{C}$, the evaluation functor $\mathrm{Fun}(\Delta^1, \mathcal{C}) \to \mathrm{Fun}(\{0\}, \mathcal{C}) \simeq \mathcal{C}$ has a left adjoint given by the diagonal embedding $\delta_{\mathcal{C}} : \mathcal{C} \to \mathrm{Fun}(\Delta^1, \mathcal{C})$. In the situation of Lemma 7.3.3.17, we obtain a *strictly commutative* diagram of adjoint functors

$$\begin{array}{ccc} \mathrm{Fun}(\Delta^1, \mathcal{D}) & \longrightarrow & \mathrm{Fun}(\Delta^1, \mathcal{C}) \\ {\scriptstyle \delta_{\mathcal{D}}}\uparrow & & \uparrow{\scriptstyle \delta_{\mathcal{C}}} \\ \mathcal{D} & \longrightarrow & \mathcal{C}. \end{array}$$

It now suffices to observe that that any invertible natural transformation is automatically coCartesian. □

To prove Lemma 7.3.3.18, we once again break the work down into two steps. First, we need a bit of terminology:

Notation 7.3.3.19. For every ∞-category $\mathcal{C}$, we let $P_*(\mathcal{C})$ denote the full subcategory of $\mathrm{Fun}(\Delta^2, \mathcal{C})$ spanned by those diagrams

$$\begin{array}{ccccc} & & B & & \\ & \nearrow & & \searrow & \\ A & & \xrightarrow{f} & & C \end{array}$$

such that f is an equivalence. If $\mathcal{C}$ is presentable, then the evaluation map

$$P_*(\mathcal{C}) \to \mathrm{Fun}(\Delta^{\{1,2\}}, \mathcal{C}) \simeq \mathrm{Fun}(\Delta^1, \mathcal{C})$$

exhibits $P_*(\mathcal{C})$ as a pointed envelope of the presentable fibration $\mathrm{Fun}(\Delta^1, \mathcal{C}) \to \mathrm{Fun}(\{1\}, \mathcal{C}) \simeq \mathcal{C}$.

Now let $p : \mathcal{D} \to \mathcal{C}$ be as in Lemma 7.3.3.18. The proof of Proposition 7.3.3.8 gives a commutative diagram

$$\begin{array}{ccc} T_{\mathcal{D}} & \longrightarrow & T_{\mathcal{C}} \\ \downarrow & & \downarrow \\ P_*(\mathcal{D}) & \longrightarrow & P_*(\mathcal{C}) \\ \downarrow & & \downarrow \\ \mathrm{Fun}(\Delta^1, \mathcal{D}) & \longrightarrow & \mathrm{Fun}(\Delta^1, \mathcal{C}). \end{array}$$

小红书 小红书号:3189205503 qq

We wish to prove that the outer square is rectilinear. In view of Lemma 7.3.3.16, it will suffice to prove the upper and bottom squares are rectilinear. For the upper square, we observe that Proposition 7.3.3.8 gives a homotopy pullback diagram

$$\begin{array}{ccc} T_{\mathcal{D}} & \longrightarrow & T_{\mathcal{C}} \\ \downarrow & & \downarrow \\ P_*(\mathcal{D}) & \longrightarrow & P_*(\mathcal{C}) \\ \downarrow & & \downarrow \\ \mathcal{C} & \longrightarrow & \mathcal{D}\,. \end{array}$$

Lemma 7.3.3.18 is therefore a consequence of the following pair of results:

Lemma 7.3.3.20. *Suppose given a commutative diagram*

$$\begin{array}{ccc} \mathcal{D} & \longrightarrow & \mathcal{C} \\ \downarrow & & \downarrow{\scriptstyle G} \\ \mathcal{D}' & \longrightarrow & \mathcal{C}' \\ \downarrow & & \downarrow \\ \mathcal{D}'' & \longrightarrow & \mathcal{C}'' \end{array}$$

of ∞-categories, where each square is homotopy Cartesian. If G admits a left adjoint relative to $\mathcal{C}''$, then the upper square is rectilinear.

Lemma 7.3.3.21. *Let $\mathcal{C}$ be a presentable ∞-category containing an object A, let $\mathcal{D} = \mathcal{C}_{A/}$. Then the diagram*

$$\begin{array}{ccc} P_*(\mathcal{D}) & \longrightarrow & P_*(\mathcal{C}) \\ \downarrow{\scriptstyle G'} & & \downarrow{\scriptstyle G} \\ \mathrm{Fun}(\Delta^1, \mathcal{D}) & \longrightarrow & \mathrm{Fun}(\Delta^1, \mathcal{C}) \end{array}$$

is rectilinear.

Proof of Lemma 7.3.3.20. Without loss of generality, we may assume that every map in the diagram

$$\begin{array}{ccc} \mathcal{D} & \longrightarrow & \mathcal{C} \\ \downarrow{\scriptstyle G'} & & \downarrow{\scriptstyle G} \\ \mathcal{D}' & \longrightarrow & \mathcal{C}' \\ \downarrow & & \downarrow \\ \mathcal{D}'' & \longrightarrow & \mathcal{C}'' \end{array}$$

小红书
小红书号:3189205503 qq

is a categorical fibration, and that each square is a pullback in the category of simplicial sets. Let F be a left adjoint to G relative to $\mathcal{C}''$, and choose a counit map $v : F \circ G \to \mathrm{id}_{\mathcal{C}}$ which is compatible with the projection to $\mathcal{C}''$ (so that v can be identified with a morphism in the ∞-category $\mathrm{Map}_{\mathcal{C}''}(\mathcal{C}, \mathcal{C})$). Let $F' : \mathcal{D}' \to \mathcal{D}$ be the map induced by F, so that v induces a natural transformation $F' \circ G' \to \mathrm{id}_{\mathcal{D}}$, which is easily verified to be the counit of an adjunction. It follows that we have a strictly commutative diagram

$$\begin{array}{ccc} \mathcal{D} & \longrightarrow & \mathcal{C} \\ {\scriptstyle F'}\uparrow & & \uparrow{\scriptstyle F} \\ \mathcal{D}' & \longrightarrow & \mathcal{C}'. \end{array}$$

To complete the proof it suffices to observe that any invertible natural transformation is automatically coCartesian. □

Proof of Lemma 7.3.3.21. The forgetful functor $G : P_*(\mathcal{C}) \to \mathrm{Fun}(\Delta^1, \mathcal{C})$ has a left adjoint F. We can identify F with the functor which carries a diagram $B \to C$ in $\mathcal{C}$ to the induced diagram

$$\begin{array}{ccccc} & & B \coprod C & & \\ & \nearrow & & \searrow & \\ C & & \xrightarrow{\mathrm{id}} & & C, \end{array}$$

regarded as an object of $P_*(\mathcal{C})$. Similarly, G' has a left adjoint F', which carries a diagram $A \to B \to C$ to the induced diagram

$$\begin{array}{ccccccc} & & & & B \coprod_A C & & \\ & & & \nearrow & & \searrow & \\ A & \longrightarrow & C & & \xrightarrow{\mathrm{id}} & & C. \end{array}$$

We observe that a diagram in $P_*(\mathcal{C})$ is a pushout square if and only if it determines a pushout square in $\mathcal{C}$ after evaluating at each vertex in Δ^2. Unwinding the definition, we see that the Lemma 7.3.3.21 is equivalent to the following elementary assertion: for every commutative diagram

$$\begin{array}{ccccc} A & \longrightarrow & B & \longrightarrow & C \\ & \searrow & \downarrow & & \downarrow \\ & & B' & \longrightarrow & C' \end{array}$$

in $\mathcal{C}$, the induced diagram

$$\begin{array}{ccc} B \coprod C & \longrightarrow & B \coprod_A C \\ \downarrow & & \downarrow \\ B' \coprod C' & \longrightarrow & B' \coprod_A C' \end{array}$$

is a pushout square. □

小红书号:3189205503 qq

7.3.4 Tangent Bundles to ∞-Categories of Algebras

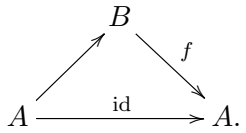
Let A be a commutative ring, and let M be an A-module. Then the direct sum $A \oplus M$ inherits the structure of a commutative ring, with multiplication described by the formula

$$(a, m)(a', m') = (aa', am' + a'm).$$

We wish to describe an analogous construction in the case where A is an $\mathbb{E}_\infty$-ring and M is a module *spectrum* over A. In this context we cannot define a ring structure on $A \oplus M$ simply by writing formulas: we must obtain $A \oplus M$ in some other way. We begin by listing some features which we expect of this construction:

(a) The square-zero extension $A \oplus M$ admits a projection map $A \oplus M \to A$.

(b) The square-zero extension $A \oplus M$ depends functorially on M. In other words, it is given by a functor



$$G : \mathrm{Mod}_A \to \mathrm{CAlg}_{/A}.$$

(c) The underlying spectrum of $A \oplus M$ can be identified (functorially) with the usual coproduct of A and M in the ∞-category of Sp.

Condition (c) automatically implies that the functor G preserves limits. Since the ∞-category Mod_A is stable, the functor G would then be equivalent to a composition

$$\mathrm{Mod}_A \xrightarrow{G'} \mathrm{Sp}(\mathrm{CAlg}_{/A}) \xrightarrow{\Omega^\infty} \mathrm{CAlg}_{/A}.$$

In fact, we will prove something stronger: the functor G' is an equivalence of ∞-categories. Let us describe a functor F' which is homotopy inverse to G'. Let X be an object of $\mathrm{Sp}(\mathrm{CAlg}_{/A})$. Then the 0th space of X is a *pointed* object of $\mathrm{CAlg}_{/A}$, which we can identify with an *augmented A-algebra*: that is, an $\mathbb{E}_\infty$-ring B which fits into a commutative diagram

We now observe that in this situation, the fiber of f inherits the structure of an A-module. We can therefore define a functor $F' : \mathrm{Sp}(\mathrm{CAlg}_{/A}) \to \mathrm{Mod}_A$ by taking $F'(X)$ to be the fiber of f.

We now have an approach to defining the desired functor G. Namely, we first construct the functor $F' : \mathrm{Sp}(\mathrm{CAlg}_{/A}) \to \mathrm{Mod}_A$ described above. If we can prove that F' is an equivalence of ∞-categories, then we can define G' to be a homotopy inverse to F', and G to be the composition of G' with the 0th space functor $\Omega^\infty : \mathrm{Sp}(\mathrm{CAlg}_{/A}) \to \mathrm{CAlg}_{/A}$.

Our goal in this section is to flesh out the ideas sketched above. It will be convenient to work in a bit more generality: rather than only considering commutative algebras, we consider algebras over an arbitrary coherent ∞-operad. We begin with some generalities.

小红书
小红书号:3189205503 qq

Definition 7.3.4.1. Let $\mathcal{O}^{\otimes}$ be an ∞-operad. We will say that a map $q : \mathcal{C}^{\otimes} \to \mathcal{O}^{\otimes}$ is a *stable $\mathcal{O}$-monoidal ∞-category* if the following conditions are satisfied:

(1) The map q is a coCartesian fibration of ∞-operads.

(2) For each object $X \in \mathcal{O}$, the fiber $\mathcal{C}_X$ is a stable ∞-category.

(3) For every morphism $\alpha \in \mathrm{Mul}_{\mathcal{O}}(\{X_i\}, Y)$, the associated functor $\alpha_! : \prod_i \mathcal{C}_{X_i} \to \mathcal{C}_Y$ is exact separately in each variable.

Remark 7.3.4.2. Let $\mathcal{O}^{\otimes}$ be an ∞-operad and let $q : \mathcal{C}^{\otimes} \to \mathcal{O}^{\otimes}$ be a stable $\mathcal{O}$-monoidal ∞-category. Then the ∞-category $\mathrm{Fun}_{\mathcal{O}}(\mathcal{O}, \mathcal{C})$ of sections of the restricted map $q_0 : \mathcal{C} \to \mathcal{O}$ is stable: this follows immediately from Proposition HTT.5.4.7.11 .

Definition 7.3.4.3. Let $\mathcal{O}^{\otimes}$ be a unital ∞-operad, and let $q : \mathcal{C}^{\otimes} \to \mathcal{O}^{\otimes}$ be a coCartesian fibration of ∞-operads. An *augmented $\mathcal{O}$-algebra object of* $\mathcal{C}$ is a morphism $f : A \to A_0$ in $\mathrm{Alg}_{\mathcal{O}}(\mathcal{C})$ such that A_0 is an initial object of $\mathrm{Alg}_{\mathcal{O}}(\mathcal{C})$. (In view of Proposition 3.2.1.8, this is equivalent to the requirement that $A_0(0) \to A_0(X)$ is q-coCartesian whenever $0 \to X$ is a morphism in $\mathcal{O}^{\otimes}$ with $0 \in \mathcal{O}^{\otimes}_{\langle 0 \rangle}$.) We let $\mathrm{Alg}^{\mathrm{aug}}_{\mathcal{O}}(\mathcal{C})$ denote the full subcategory of $\mathrm{Fun}(\Delta^1, \mathrm{Alg}_{\mathcal{O}}(\mathcal{C}))$ spanned by the augmented $\mathcal{O}$-algebra objects in $\mathcal{C}$.

Suppose further that $\mathcal{C}^{\otimes}$ is a stable $\mathcal{O}$-monoidal ∞-category, so that $\mathrm{Fun}_{\mathcal{O}}(\mathcal{O}, \mathcal{C})$ is stable (Remark 7.3.4.2). Let $\theta : \mathrm{Alg}_{\mathcal{O}}(\mathcal{C}) \to \mathrm{Fun}_{\mathcal{O}}(\mathcal{O}, \mathcal{C})$ denote the restriction functor. Given an augmented $\mathcal{O}$-algebra object $A \to A_0$ of $\mathcal{C}$, we define the *augmentation ideal* to the the fiber of the induced morphism $\theta(A) \to \theta(A_0)$. The formation of augmentation ideals determines a functor

$$\mathrm{Alg}^{\mathrm{aug}}_{\mathcal{O}}(\mathcal{C}) \to \mathrm{Fun}_{\mathcal{O}}(\mathcal{O}, \mathcal{C}).$$

Remark 7.3.4.4. Let $\mathcal{O}^{\otimes}$ be a small ∞-operad and let $q : \mathcal{C}^{\otimes} \to \mathcal{O}^{\otimes}$ be a presentable $\mathcal{O}$-monoidal ∞-category. It follows from Proposition HTT.5.4.7.11 that the ∞-category $\mathrm{Fun}_{\mathcal{O}}(\mathcal{O}, \mathcal{C})$ is presentable, and that for each object $X \in \mathcal{O}$ the evaluation functor $e_X : \mathrm{Fun}_{\mathcal{O}}(\mathcal{O}, \mathcal{C})$ preserves small limits and small colimits. It follows from Corollary HTT.5.5.2.9 that e_X admits both a left and a right adjoint, which we will denote by $(e_X)_!$ and $(e_X)_*$.

The following result characterizes the augmentation ideal functor by a universal property:

Proposition 7.3.4.5. *Let $\mathcal{O}^{\otimes}$ be a small unital ∞-operad and let $\mathcal{C}^{\otimes} \to \mathcal{O}^{\otimes}$ be a presentable stable $\mathcal{O}$-monoidal ∞-category. Let $0_{\mathcal{C}}$ denote a zero object of the stable ∞-category $\mathrm{Fun}_{\mathcal{O}}(\mathcal{O}, \mathcal{C})$, and let $1_{\mathcal{C}}$ denote an initial object of $\mathrm{Alg}_{\mathcal{O}}(\mathcal{C})$. Then there exists a pair of adjoint functors $\mathrm{Fun}_{\mathcal{O}}(\mathcal{O}, \mathcal{C}) \underset{g}{\overset{f}{\rightleftarrows}} \mathrm{Alg}^{\mathrm{aug}}_{\mathcal{O}}(\mathcal{C})$ with the following properties:*

小红书
小红书号:3189205503 qq

(1) *The functor f is given by composition*

$$\mathrm{Fun}_{\mathcal{O}}(\mathcal{O},\mathcal{C}) \simeq \mathrm{Fun}_{\mathcal{O}}(\mathcal{O},\mathcal{C})^{/0_{\mathcal{C}}} \to \mathrm{Alg}_{\mathcal{O}}(\mathcal{C})^{/1_{\mathcal{C}}} \simeq \mathrm{Alg}^{\mathrm{aug}}_{\mathcal{O}}(\mathcal{C}),$$

where the middle map is induced by a left adjoint F to the forgetful functor $G : \mathrm{Alg}_{\mathcal{O}}(\mathcal{C}) \to \mathrm{Fun}_{\mathcal{O}}(\mathcal{O},\mathcal{C})$. Here we implicitly invoke the identification $1_{\mathcal{C}} \simeq F(0_{\mathcal{C}})$; note that the existence of F follows from Corollary 3.1.3.5.

(2) *The functor $g : \mathrm{Alg}^{\mathrm{aug}}_{\mathcal{O}}(\mathcal{C}) \to \mathrm{Fun}_{\mathcal{O}}(\mathcal{O},\mathcal{C})$ is the augmentation ideal functor.*

(3) *Let X and Y be objects of $\mathcal{O}^{\otimes}$, and let $(e_X)_! : \mathcal{C}_X \to \mathrm{Fun}_{\mathcal{O}}(\mathcal{O},\mathcal{C})$ and $e_Y : \mathrm{Fun}_{\mathcal{O}}(\mathcal{O},\mathcal{C})$ be as in Remark 7.3.4.4. Then the composition*

$$\mathcal{C}_X \xrightarrow{(e_X)_!} \mathrm{Fun}_{\mathcal{O}}(\mathcal{O},\mathcal{C}) \xrightarrow{f} \mathrm{Alg}^{\mathrm{aug}}_{\mathcal{O}}(\mathcal{C}) \xrightarrow{g} \mathrm{Fun}_{\mathcal{O}}(\mathcal{O},\mathcal{C}) \xrightarrow{e_Y} \mathcal{C}_Y$$

is equivalent to the functor $C \mapsto \coprod_{n>0} \mathrm{Sym}^n_{\mathcal{O},Y}(C)$ (see Construction 3.1.3.9).

Proof. The existence of the functor g and assertion (2) follow from Proposition HTT.5.2.5.1 , together with the definition of the augmentation ideal functor. Invoking (2), we deduce that there is a fiber sequence

$$g \circ f \to G \circ F \xrightarrow{h} \underline{G}(1_{\mathcal{C}})$$

in the stable ∞-category of functors from $\mathrm{Fun}_{\mathcal{O}}(\mathcal{O},\mathcal{C})$ to itself, where $\underline{G}(1_{\mathcal{C}})$ denotes the constant functor taking the value $G(1_{\mathcal{C}})$. Theorem The results of §3.1.3 guarantee that $e_Y \circ G \circ F \circ (e_X)_!$ can be idenitifed with the functor $\coprod_{n\geq 0} \mathrm{Sym}^n_{\mathcal{O},Y}$. We observe that the map h is split by the inclusion $\mathrm{Sym}^0_{\mathcal{O},Y} \to \coprod_{n\geq 0} \mathrm{Sym}^n_{\mathcal{O},Y}$, so that we obtain an identification of $g \circ f$ with the complementary summand $\coprod_{n>0} \mathrm{Sym}^n_{\mathcal{O},Y}$. □

Remark 7.3.4.6. Let $\mathrm{Fun}_{\mathcal{O}}(\mathcal{O},\mathcal{C}) \underset{g}{\overset{f}{\rightleftarrows}} \mathrm{Alg}^{\mathrm{aug}}_{\mathcal{O}}(\mathcal{C})$ be as in Proposition 7.3.4.5, and let $X, Y \in \mathcal{O}$. Unwinding the definitions, we see that the unit map $\mathrm{id} \to g \circ f$ induces a functor $e_Y \circ (e_X)_! \to e_Y \circ g \circ f \circ (e_X)_!$. This can be identified with the inclusion of the summand $\mathrm{Sym}^1_{\mathcal{O},Y} \to \coprod_{n>0} \mathrm{Sym}^n_{\mathcal{O},Y}$.

The main result of this section is the following:

Theorem 7.3.4.7. *Let $\mathcal{O}^{\otimes}$ be a unital ∞-operad and let $\mathcal{C}^{\otimes} \to \mathcal{O}^{\otimes}$ be a stable $\mathcal{O}$-monoidal ∞-category. Then the augmentation ideal functor $G : \mathrm{Alg}^{\mathrm{aug}}_{\mathcal{O}}(\mathcal{C}) \to \mathrm{Fun}_{\mathcal{O}}(\mathcal{O},\mathcal{C})$ induces an equivalence of ∞-categories $\mathrm{Sp}(\mathrm{Alg}^{\mathrm{aug}}_{\mathcal{O}}(\mathcal{C})) \to \mathrm{Sp}(\mathrm{Fun}_{\mathcal{O}}(\mathcal{O},\mathcal{C})) \simeq \mathrm{Fun}_{\mathcal{O}}(\mathcal{O},\mathcal{C})$.*

The proof of Theorem 7.3.4.7 will use some ideas from the calculus of functors.

Lemma 7.3.4.8. *Let K be a simplicial set. Let $\mathcal{C}$ be a pointed ∞-category which admits finite colimits, and let $\mathcal{D}$ be stable ∞-category which admits sequential colimits and K-indexed colimits. Then the derivative functor $\partial : \mathrm{Fun}_*(\mathcal{C},\mathcal{D}) \to \mathrm{Exc}(\mathcal{C},\mathcal{D})$ preserves K-indexed colimits.*

小红书
小红书号:3189205503 qq

Proof. Since $\mathcal{D}$ is stable, the loop functor $\Omega_{\mathcal{D}}$ is an equivalence of ∞-categories. It follows that $\Omega_{\mathcal{D}}$ preserves K-indexed colimits. We observe that $\mathrm{Exc}(\mathcal{C}, \mathcal{D})$ is the full subcategory of $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$ spanned by those functors which are right exact; it follows that $\mathrm{Exc}(\mathcal{C}, \mathcal{D})$ is stable under K-indexed colimits in $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$. Similarly, $\mathrm{Fun}_*(\mathcal{C}, \mathcal{D})$ is stable under K-indexed colimits in $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$; we therefore conclude that K-indexed colimits in $\mathrm{Fun}_*(\mathcal{C}, \mathcal{D})$ and $\mathrm{Exc}(\mathcal{C}, \mathcal{D})$ are computed pointwise. The desired result now follows from the formula for computing the derivative given in Example 6.1.1.28 □

Remark 7.3.4.9. Let $\mathcal{C} \to \mathcal{O}$ be a presentable fibration of ∞-categories, where $\mathcal{O}$ is small. For each $X \in \mathcal{O}$, let $(e_X)_!$ denote a left adjoint to the evaluation functor $e_X : \mathrm{Fun}_{\mathcal{O}}(\mathcal{O}, \mathcal{C}) \to \mathcal{C}_X$. Then the essential images of the functors $(e_X)_!$ generate the ∞-category $\mathcal{D} = \mathrm{Fun}_{\mathcal{O}}(\mathcal{O}, \mathcal{C})$ under small colimits. To prove this, let $\mathcal{D}_0$ denote the smallest full subcategory of $\mathcal{D}$ containing the essential image of each $(e_X)_!$ and closed under small colimits in $\mathcal{D}$. Since the essential image of each $(e_X)_!$ is generated under small colimits by a small collection of objects, we deduce that $\mathcal{D}_0 \subseteq \mathcal{D}$ is presentable. Let D be an object of $\mathcal{D}$; we wish to prove that $D \in \mathcal{D}_0$. Let $\chi : \mathcal{D}^{op} \to \mathcal{S}$ be the functor represented by D. The composite functor

$$\chi | \mathcal{D}_0 : \mathcal{D}_0^{op} \to \mathcal{D}^{op} \to \mathcal{S}$$

preserves small limits, and is therefore representable by an object $D_0 \in \mathcal{D}_0$ (Proposition HTT.5.5.2.2). We therefore obtain a map $f : D_0 \to D$ which exhibits D_0 as a $\mathcal{D}_0$-colocalization of D. In particular, for each $X \in \mathcal{O}$ and each $C \in \mathcal{C}_X$, composition with f induces a homotopy equivalence

$$\mathrm{Map}_{\mathcal{C}_X}(C, D_0(X)) \simeq \mathrm{Map}_{\mathcal{D}}((e_X)_!(C), D_0) \to \mathrm{Map}_{\mathcal{D}}((e_X)_!(C), D) \simeq \mathrm{Map}_{\mathcal{C}_X}(C, D(X)).$$

This proves that $e_X(f)$ is an equivalence for each $X \in \mathcal{O}$, so that f is an equivalence and $D \in \mathcal{D}_0$ as required.

Proposition 7.3.4.10. *Let $\mathcal{O}^{\otimes}$ be a unital ∞-operad, and let $\mathcal{C}^{\otimes}$ be a presentable stable $\mathcal{O}$-monoidal ∞-category. Let $G : \mathrm{Alg}^{\mathrm{aug}}_{\mathcal{O}}(\mathcal{C}) \to \mathrm{Fun}_{\mathcal{O}}(\mathcal{O}, \mathcal{C})$ be the augmentation ideal functor, and let F be a left adjoint to G. Then the unit map $\mathrm{id} \to GF$ induces an equivalence of derivatives $\alpha : \partial \mathrm{id} \to \partial(GF)$.*

Proof. We wish to show that for every object $M \in \mathrm{Fun}_{\mathcal{O}}(\mathcal{O}, \mathcal{C})$, the natural transformation α induces an equivalence

$$\alpha_M : M \simeq \partial(\mathrm{id})(M) \to \partial(GF)(M).$$

Since both sides are compatible with the formation of colimits in M, it will suffice to prove this in the case where $M = (e_X)_!(C)$ for some $X \in \mathcal{O}$ and some $C \in \mathcal{C}_X$ (Remark 7.3.4.9). Moreover, to prove that α_M is an equivalence, it suffices to show that $e_Y(\alpha_M)$ is an equivalence in $\mathcal{C}_Y$, for each $Y \in \mathcal{O}$. In other words, it suffices to show that α induces an equivalence

$$\beta : e_Y \circ (e_X)_! \to e_Y \circ \partial(GF) \circ (e_X)_!.$$

小红书
小红书号:3189205503 qq

Since the functors $(e_X)_!$ and e_Y are exact, we can identify the latter composition with $\partial(e_Y \circ G \circ F \circ (e_X))_!$ (Corollary 6.2.1.24).

According to Proposition 7.3.4.5, the functor $e_Y \circ G \circ F \circ (e_X)_!$ can be identified with the total symmetric power functor $C \mapsto \coprod_{n>0} \mathrm{Sym}^n_{\mathcal{O},Y}(C)$. According to Remark 7.3.4.6, we can express this as the coproduct of $e_Y \circ (e_X)_!$ with the functor T given by the formula $T(C) \simeq \coprod_{n \geq 2} \mathrm{Sym}^n_{\mathcal{O},Y}(C)$. In view of Lemma 7.3.4.8, it will suffice to show that each of the derivatives $\partial \mathrm{Sym}^n_{\mathcal{O},Y}$ is nullhomotopic for $n \geq 2$. We observe that $\mathrm{Sym}^n_{\mathcal{O},Y}$ can be expressed as a colimit of functors of the form

$$\mathcal{C}_X \xrightarrow{\delta} \mathcal{C}_X^n \xrightarrow{\gamma_!} \mathcal{C}_Y$$

where $\gamma_!$ denotes the functor associated to an operation $\gamma \in \mathrm{Mul}_{\mathcal{O}}(\{X\}_{1 \leq i \leq n}, Y)$. In view of Lemma 7.3.4.8, it suffices to show that each constituent $\partial(\delta \circ \gamma_!)$ is nullhomotopic, which follows from Proposition 6.1.3.10. □

Lemma 7.3.4.11. *Let $\mathcal{C}$ be a stable ∞-category, let $f : C \to D$ be a morphism in $\mathcal{C}$, and let $f^* : \mathcal{C}^{/D} \to \mathcal{C}^{/C}$ be the functor given by pullback along f. Then:*

(1) *The functor f^* is conservative.*

(2) *Let K be a weakly contractible simplicial set, and assume that $\mathcal{C}$ admits K-indexed colimits. Then the functor f^* preserves K-indexed colimits.*

Proof. Let $\mathcal{E}$ denote the full subcategory of $\mathrm{Fun}(\Delta^1 \times \Delta^1, \mathcal{C}) \times_{\mathrm{Fun}(\{1\} \times \Delta^1, \mathcal{C})} \{f\}$ spanned by the pullback diagrams

$$\begin{array}{ccc} C' & \longrightarrow & D' \\ \downarrow & & \downarrow \\ C & \xrightarrow{f} & D. \end{array}$$

Since $\mathcal{C}$ admits pullbacks, Proposition HTT.4.3.2.15 implies that evaluation along $\Delta^1 \times \{1\}$ induces a trivial Kan fibration $\mathcal{E} \to \mathcal{C}^{/D}$. Let g denote a section of this trivial fibration. Then the functor f^* can be identified with the composition

$$\mathcal{C}^{/D} \xrightarrow{g} \mathcal{E} \xrightarrow{g'} \mathcal{C}^{/C},$$

where g' is given by evaluation along $\Delta^1 \times \{0\}$.

Let u be a morphism in $\mathcal{C}^{/D}$. Let σ denote the fiber of the morphism $g(u)$, formed in the stable ∞-category $\mathrm{Fun}(\Delta^1 \times \Delta^1, \mathcal{C})$. Then σ is a pullback diagram

$$\begin{array}{ccc} W & \longrightarrow & X \\ \downarrow & & \downarrow \\ Y & \longrightarrow & Z \end{array}$$

小红书
小红书号:3189205503 qq

in the ∞-category $\mathcal{C}$. The objects Y and Z are both zero, so the bottom horizontal map is an equivalence. It follows that the upper horizontal map is an equivalence. If $f^*(u)$ is an equivalence, then $W \simeq 0$. It follows that $X \simeq 0$, so that u is an equivalence in $\mathcal{C}^{/D}$. This completes the proof of (1).

To prove (2), let us choose a colimit diagram $\overline{p} : K^{\triangleright} \to \mathcal{C}^{/D}$. Let $\overline{q} = g \circ \overline{p}$. We wish to prove that $g' \circ \overline{q}$ is a colimit diagram in $\mathcal{C}^{/C}$. In view of Proposition HTT.1.2.13.8 , it will suffice to show that $\overline{q}$ defines a colimit diagram in $\mathrm{Fun}(\Delta^1 \times \Delta^1, \mathcal{C})$. Let $q = \overline{q}|K$, and let $\sigma \in \mathrm{Fun}(\Delta^1 \times \Delta^1, \mathcal{C})$ be a colimit of q in $\mathrm{Fun}(\Delta^1 \times \Delta^1, \mathcal{C})$. Since the class of pushout diagrams in $\mathcal{C}$ is stable under colimits, we conclude that σ is a pushout diagram. Let σ' be the image under $\overline{q}$ of the cone point of $K^{\triangleright}$, let $\alpha : \sigma \to \sigma'$ be the map determined by $\overline{q}$, and let $\tau \in \mathrm{Fun}(\Delta^1 \times \Delta^1, \mathcal{C})$ be the cofiber of α. We wish to prove that α is an equivalence, which is equivalent to the assertion that $\tau \simeq 0$. We may view τ as a pushout diagram

$$\begin{array}{ccc} W & \longrightarrow & X \\ \downarrow & & \downarrow \\ Y & \longrightarrow & Z \end{array}$$

in $\mathcal{C}$. Since $\mathcal{C}$ is stable, this diagram is also a pullback. Consequently, it will suffice to show that the objects $X, Y, Z \in \mathcal{C}$ are equivalent to zero. For the object X, this follows from our assumption that $\overline{p}$ is a colimit diagram (and Proposition HTT.1.2.13.8). To show that Y and Z are zero, it suffices to observe that every constant map $K^{\triangleright} \to \mathcal{C}$ is a colimit diagram, because K is weakly contractible (Corollary HTT.4.4.4.10). $\square$

Lemma 7.3.4.12. *Suppose given an adjunction of ∞-categories*

$$\mathcal{C} \underset{G}{\overset{F}{\rightleftarrows}} \mathcal{D}$$

where $\mathcal{C}$ is stable. Let C be an object of $\mathcal{C}$, and consider the induced adjunction

$$\mathcal{C}_{/C} \underset{g}{\overset{f}{\rightleftarrows}} \mathcal{D}_{/FC}$$

(see Proposition HTT.5.2.5.1). Then:

(1) *If the functor G is conservative, then g is conservative.*

(2) *Let K be a weakly contractible simplicial set. Assume that $\mathcal{C}$ and $\mathcal{D}$ admit K-indexed colimits, that the functor G preserves K-indexed colimits, and that $\mathcal{C}$ is stable. Then the ∞-categories $\mathcal{D}^{/FC}$ and $\mathcal{C}^{/C}$ admit K-indexed colimits, and the functor g preserves K-indexed colimits.*

Proof. We first prove (1). Proposition HTT.5.2.5.1 shows that g can be written as a composition

$$\mathcal{D}_{/FC} \xrightarrow{g'} \mathcal{C}_{/GFC} \xrightarrow{g''} \mathcal{C}_{/C},$$

小红书
小红书号:3189205503 qq

where g' is induced by G and g'' is given by pullback along the unit map $C \to GFC$. It will therefore suffice to show that g' and g'' are conservative. We have a commutative diagram of ∞-categories

$$\begin{array}{ccc} \mathcal{D}^{/FC} & \xrightarrow{g'} & \mathcal{C}^{/GFC} \\ \downarrow & & \downarrow \\ \mathcal{D} & \xrightarrow{G} & \mathcal{C}. \end{array}$$

Since the vertical functors detect equivalences and G is conservative, we deduce that g' is conservative. It follows from Lemma HTT.5.2.8.22 that g'' is conservative as well.

We now prove (2). Proposition HTT.1.2.13.8 implies that the ∞-categories $\mathcal{C}^{/C}$, $\mathcal{C}^{/GFC}$, and $\mathcal{D}^{/FC}$ admit K-indexed colimits. Consequently, it will suffice to show that g' and g'' preserve K-indexed colimits. For the functor g', this follows from Proposition HTT.1.2.13.8 and our assumption that G preserves K-indexed colimits. For the functor g'', we invoke Lemma 7.3.4.11. □

Proof of Theorem 7.3.4.7. Enlarging the universe if necessary, we may suppose that $\mathcal{O}^{\otimes}$ and $\mathcal{C}^{\otimes}$ are small. The coCartesian fibration $\mathcal{C}^{\otimes} \to \mathcal{O}^{\otimes}$ is classified by a map of ∞-operads $\chi : \mathcal{O}^{\otimes} \to \mathcal{C}\mathrm{at}_{\infty}^{\times}$. Let χ' denote the composition of χ with the ∞-operad map $\mathrm{Ind} : \mathcal{C}\mathrm{at}_{\infty}^{\times} \to \widehat{\mathcal{C}\mathrm{at}}_{\infty}^{\times}$ determined by Remark 4.8.1.8, and let $\mathcal{C}'^{\otimes} \to \mathcal{O}^{\otimes}$ be the $\mathcal{O}$-monoidal ∞-category classified by χ'. Then we have a fully faithful functor $\mathcal{C}^{\otimes} \to \mathcal{C}'^{\otimes}$ which induces a homotopy pullback diagram

$$\begin{array}{ccc} \mathrm{Alg}_{\mathcal{O}}^{\mathrm{aug}}(\mathcal{C}) & \longrightarrow & \mathrm{Alg}_{\mathcal{O}}^{\mathrm{aug}}(\mathcal{C}') \\ \downarrow & & \downarrow \\ \mathrm{Fun}_{\mathcal{O}}(\mathcal{O}, \mathcal{C}) & \longrightarrow & \mathrm{Fun}_{\mathcal{O}}(\mathcal{O}, \mathcal{C}') \end{array}$$

where the horizontal maps are fully faithful inclusions. Passing to stable envelopes, we get a homotopy pullback diagram

$$\begin{array}{ccc} \mathrm{Sp}(\mathrm{Alg}_{\mathcal{O}}^{\mathrm{aug}}(\mathcal{C})) & \longrightarrow & \mathrm{Sp}(\mathrm{Alg}_{\mathcal{O}}^{\mathrm{aug}}(\mathcal{C}') \\ \downarrow & & \downarrow \\ \mathrm{Sp}(\mathrm{Fun}_{\mathcal{O}}(\mathcal{O}, \mathcal{C})) & \longrightarrow & \mathrm{Sp}(\mathrm{Fun}_{\mathcal{O}}(\mathcal{O}, \mathcal{C}')). \end{array}$$

It will therefore suffice to show that the right vertical map is an equivalence. In other words, we may replace $\mathcal{C}^{\otimes}$ by $\mathcal{C}'^{\otimes}$ and thereby reduce to the case where $\mathcal{C}^{\otimes} \to \mathcal{O}^{\otimes}$ is a presentable stable $\mathcal{O}$-monoidal ∞-category.

The forgetful functor $\mathrm{Alg}_{\mathcal{O}}(\mathcal{C}) \to \mathrm{Fun}_{\mathcal{O}}(\mathcal{C})$ is conservative (Lemma 3.2.2.6) and preserves geometric realizations of simplicial objects (Proposition 3.2.3.1). It follows from Lemma 7.3.4.12 that G has the same properties. Using Theorem 4.7.3.5, we deduce that G exhibits $\mathrm{Alg}_{\mathcal{O}}^{\mathrm{aug}}(\mathcal{C})$ as monadic over $\mathrm{Fun}_{\mathcal{O}}(\mathcal{O}, \mathcal{C})$ (see Definition 4.7.3.4). The desired result now follows by combining Proposition 7.3.4.10 with Corollary 6.2.2.17. □

小红书
小红书号:3189205503 qq

In the special case where the ∞-operad $\mathcal{O}^{\otimes}$ is coherent, we can use Theorem 7.3.4.7 to describe other fibers of the tangent bundle of $\mathrm{Alg}_{\mathcal{O}}(\mathcal{C})$:

Theorem 7.3.4.13. *Let $\mathcal{O}^{\otimes}$ be a coherent ∞-operad, let $\mathcal{C}^{\otimes} \to \mathcal{O}^{\otimes}$ be a stable $\mathcal{O}$-monoidal ∞-category, and let $A \in \mathrm{Alg}_{\mathcal{O}}(\mathcal{C})$ be a $\mathcal{O}$-algebra object of $\mathcal{C}$. Then the ∞-category $\mathrm{Sp}(\mathrm{Alg}_{\mathcal{O}}(\mathcal{C})_{/A})$ is canonically equivalent to $\mathrm{Fun}_{\mathcal{O}}(\mathcal{O}, \mathrm{Mod}_A^{\mathcal{O}}(\mathcal{C}))$.*

Corollary 7.3.4.14. *Let A be an $\mathbb{E}_\infty$-ring. There is a canonical equivalence of ∞-categories*

$$\mathrm{Sp}(\mathrm{CAlg}_{/A}) \simeq \mathrm{Mod}_A .$$

Remark 7.3.4.15. In the situation of Theorem 7.3.4.13, we have an evident functor

$$\Omega^\infty : \mathrm{Fun}_{\mathcal{O}}(\mathcal{O}, \mathrm{Mod}_A^{\mathcal{O}}(\mathcal{C})) \simeq \mathrm{Sp}(\mathrm{Alg}_{\mathcal{O}}(\mathcal{C})_{/A}) \to \mathrm{Alg}_{\mathcal{O}}(\mathcal{C})_{/A}.$$

This functor associates to each $M \in \mathrm{Fun}_{\mathcal{O}}(\mathcal{O}, \mathrm{Mod}_A^{\mathcal{O}}(\mathcal{C}))$ a commutative algebra object which we will denote by $A \oplus M$. The proof of Theorem 7.3.4.13 will justify this notation; that is, we will see that when regarded as an object of $\mathrm{Fun}_{\mathcal{O}}(\mathcal{O}, \mathcal{C})$, $A \oplus M$ can be canonically identified with the coproduct of A and M.

Proof. The desired equivalence is given by the composition

$$\begin{aligned}
\mathrm{Sp}(\mathrm{Alg}_{\mathcal{O}}(\mathcal{C})_{/A}) &\simeq \mathrm{Sp}((\mathrm{Alg}_{\mathcal{O}}(\mathcal{C})_{/A})_{A/}) \\
&\simeq \mathrm{Sp}((\mathrm{Alg}_{\mathcal{O}}(\mathcal{C})_{A/})_{/A}) \\
&\overset{\phi}{\simeq} \mathrm{Sp}(\mathrm{Alg}_{\mathcal{O}}(\mathrm{Mod}_A^{\mathcal{O}}(\mathcal{C})))_{/A} \\
&\simeq \mathrm{Sp}(\mathrm{Alg}_{\mathcal{O}}^{\mathrm{aug}}(\mathrm{Mod}_A^{\mathcal{O}}(\mathcal{C}))) \\
&\overset{\phi'}{\simeq} \mathrm{Fun}_{\mathcal{O}}(\mathcal{O}, \mathrm{Mod}_A^{\mathcal{O}}(\mathcal{C})).
\end{aligned}$$

Here ϕ is the equivalence of Corollary 3.4.1.7, ϕ' is given by Proposition 7.3.4.7. □

Remark 7.3.4.16. Let $\mathcal{C}^{\otimes}$ be a stable symmetric monoidal ∞-category (such that the tensor product on $\mathcal{C}$ is exact in each variable) let A be a commutative algebra object of $\mathcal{C}$, let M be an A-module, and let $A \oplus M$ denote the image of M under the composition

$$\mathrm{Mod}_A(\mathcal{C}) \simeq \mathrm{Sp}(\mathrm{CAlg}(\mathcal{C})_{/A}) \xrightarrow{\Omega^\infty} \mathrm{CAlg}(\mathcal{C})_{/A}.$$

We claim that the algebra structure on $A \oplus M$ is "square-zero" in the homotopy category $\mathrm{h}\mathcal{C}$. In other words:

(1) The unit map $1_{\mathcal{C}} \to A \oplus M$ is homotopic to the composition of $1_{\mathcal{C}} \to A$ with the inclusion $A \to A \oplus M$.

小红书
小红书号:3189205503 qq

(2) The multiplication

$$m : (A \otimes A) \oplus (A \otimes M) \oplus (M \otimes A) \oplus (M \otimes M) \simeq (A \oplus M) \otimes (A \oplus M) \to A \oplus M$$

is given as follows:

(i) On the summand $A \otimes A$, the map m is homotopic to the composition of the multiplication map $A \otimes A \to A$ with the inclusion $A \to A \oplus M$.

(ii) On the summands $A \otimes M$ and $M \otimes A$, the map m is given by composing the action of A on M with the inclusion $M \to A \oplus M$.

(iii) On the summand $M \otimes M$, the map m is nullhomotopic.

Only assertion (iii) requires proof. For this, we will invoke the fact that the commutative algebra structure on $A \oplus M$ depends functorially on M. Consequently, for every A-module N we obtain a map $\psi_N : N \otimes N \to N$, which we must show to be nullhomotopic. Let M' and M'' be copies of the A-module M, which we will distinguish notationally for clarity, and let $f : M' \oplus M'' \to M$ denote the "fold" map which is the identity on each factor. Invoking the functoriality of ψ, we deduce that the map $\psi_M : M \otimes M \to M$ factors as a composition

$$M \otimes M = M' \otimes M'' \to (M' \oplus M'') \otimes (M' \oplus M'') \overset{\psi_{M' \oplus M''}}{\longrightarrow} M' \oplus M'' \overset{f}{\to} M.$$

Consequently, to prove that ψ_M is nullhomotopic, it will suffice to show that $\phi = \psi_{M' \oplus M''} | (M' \otimes M'')$ is nullhomotopic. Let $\pi_{M'} : M' \oplus M'' \to M'$ and $\pi_{M''} : M \oplus M'' \to M''$ denote the projections onto the first and second factor, respectively. To prove that $\psi_{M' \oplus M''}$ is nullhomotopic, it suffices to show that $\pi_{M'} \circ \phi$ and $\pi_{M''} \circ \phi$ are nullhomotopic. We now invoke functoriality once more to deduce that $\pi_{M'} \circ \phi$ is homotopic to the composition

$$M' \otimes M'' \overset{(\mathrm{id},0)}{\longrightarrow} M' \otimes M' \overset{\psi_{M'}}{\longrightarrow} M'.$$

This composition is nullhomotopic, since the first map factors through $M' \otimes 0 \simeq 0$. The same argument shows that $\pi_{M''} \circ \phi$ is nullhomotopic, as desired.

Remark 7.3.4.17. Let A be an $\mathbb{E}_\infty$-ring, let M be an A-module, and let $A \oplus M$ denote the corresponding square-zero extension. As a graded abelian group, we may identify $\pi_*(A \oplus M)$ with the direct sum $(\pi_* A) \oplus (\pi_* M)$. It follows from Remark 7.3.4.16 that the multiplication on $\pi_*(A \oplus M)$ is given on homogeneous elements by the formula

$$(a, m)(a', m') = (aa', am' + (-1)^{\deg(a') \deg(m)} a'm).$$

In particular, if A is an ordinary commutative ring (viewed as a discrete $\mathbb{E}_\infty$-ring) and M is an ordinary A-module, then we can identify the discrete $\mathbb{E}_\infty$-ring $A \oplus M$ with the classical square-zero extension discussed in the introduction to this section.

小红书
小红书号:3189205503 qq

We now prove a "global" version of Theorem 7.3.4.13:

Theorem 7.3.4.18. *Let $\mathcal{O}^{\otimes}$ be a coherent ∞-operad, and let $\mathcal{C}^{\otimes} \to \mathcal{O}^{\otimes}$ be a presentable stable $\mathcal{O}$-monoidal ∞-category. Then there is a canonical equivalence*

$$\phi : T_{\mathrm{Alg}_{\mathcal{O}}(\mathcal{C})} \to \mathrm{Alg}_{\mathcal{O}}(\mathcal{C}) \times_{\mathrm{Fun}(\mathcal{O}, \mathrm{Alg}_{\mathcal{O}}(\mathcal{C}))} \mathrm{Fun}_{\mathcal{O}}(\mathcal{O}, \mathrm{Mod}^{\mathcal{O}}(\mathcal{C}))$$

of presentable fibrations over $\mathrm{Alg}_{\mathcal{O}}(\mathcal{C})$.

In other words, we may view $T_{\mathrm{Alg}_{\mathcal{O}}(\mathcal{C})}$ as the ∞-category whose objects are pairs (A, M), where A is a $\mathcal{O}$-algebra object of $\mathcal{C}$ and M is an A-module. The idea of the proof is simple: we will define ϕ using a relative version of the augmentation ideal functor defined above. We will then show that ϕ is a map of Cartesian fibrations, so that the condition that ϕ be an equivalence can be checked fibrewise. We are then reduced to the situation of Theorem 7.3.4.13.

Proof. We will denote objects of $\mathcal{M} = \mathrm{Alg}_{\mathcal{O}}(\mathcal{C}) \times_{\mathrm{Fun}(\mathcal{O}, \mathrm{Alg}_{\mathcal{O}}(\mathcal{C}))} \mathrm{Fun}_{\mathcal{O}}(\mathcal{O}, \mathrm{Mod}^{\mathcal{O}}(\mathcal{C}))$ by pairs (A, M), where $A \in \mathrm{Alg}_{\mathcal{O}}(\mathcal{C})$ and $M \in \mathrm{Fun}_{\mathcal{O}}(\mathcal{O}, \mathrm{Mod}^{\mathcal{O}}(\mathcal{C}))$ is a module over A.

Let $\mathcal{E} = \mathrm{Fun}(\Delta^1 \times \Delta^1, \mathrm{Alg}_{\mathcal{O}}(\mathcal{C})) \times_{\mathrm{Fun}(\Delta^2, \mathrm{Alg}_{\mathcal{O}}(\mathcal{C}))} \mathrm{Alg}_{\mathcal{O}}(\mathcal{C})$ denote the ∞-category of diagrams of the form

$$\begin{array}{ccc} A & \longrightarrow & B \\ {\scriptstyle \mathrm{id}}\downarrow & \searrow^{\mathrm{id}} & \downarrow \\ A & \xrightarrow[\mathrm{id}]{} & A, \end{array}$$

of $\mathcal{O}$-algebra objects of $\mathcal{C}$. The canonical map $\mathrm{Alg}_{\mathcal{O}}(\mathcal{C}) \to \mathrm{Alg}_{\mathcal{O}}(\mathrm{Mod}^{\mathcal{O}}(\mathcal{C}))$ determines a section s of the projection

$$p : \mathcal{X} \to \mathrm{Alg}_{\mathcal{O}}(\mathcal{C}),$$

which we can think of informally as assigning to an algebra A the pair (A, A) where we regard A as a module over itself.

Let $\mathcal{D}$ denote the fiber product

$$\mathrm{Fun}(\Delta^1 \times \Delta^1, \mathcal{M}) \times_{\mathrm{Fun}(\Delta^1 \times \{1\}, \mathcal{M})} \mathrm{Fun}(\Delta^1 \times \{1\}, \mathrm{Alg}_{\mathcal{O}}(\mathcal{C})),$$

so that we can identify objects of $\mathcal{D}$ with commutative squares

$$\begin{array}{ccc} (A, M) & \longrightarrow & (B, B) \\ \downarrow & & \downarrow \\ (A', M') & \longrightarrow & (B', B') \end{array}$$

小红书 小红书号:3189205503 qq

in the ∞-category $\mathcal{M}$. Let $\overline{\mathcal{E}}$ denote the full subcategory of $\mathcal{E} \times_{\mathrm{Fun}(\Delta^1 \times \Delta^1, \mathrm{Alg}_{\mathcal{O}}(\mathcal{C}))} \mathcal{D}$ spanned by those squares

$$\begin{array}{ccc} (A, M) & \longrightarrow & (B, B) \\ \downarrow & & \downarrow \\ (A, M') & \longrightarrow & (A, A) \end{array}$$

which are p-limit diagrams, and such that M' is a zero object of $\mathrm{Fun}_{\mathcal{O}}(\mathcal{O}, \mathrm{Mod}_A^{\mathcal{O}}(\mathcal{C}))$. Invoking Proposition HTT.4.3.2.15 twice (and Theorem 3.4.3.1), we deduce that the projection map $\overline{\mathcal{E}} \to \mathcal{E}$ is a trivial Kan fibration. Let $r : \mathcal{E} \to \overline{\mathcal{E}}$ be a section of this projection, and let $r' : \overline{\mathcal{E}} \to \mathcal{X}$ be given by evaluation in the upper left hand corner. Let ψ denote the composition

$$\psi : \mathcal{E} \xrightarrow{r} \overline{\mathcal{E}} \xrightarrow{r'} \mathcal{M},$$

so that ψ carries a diagram

$$\begin{array}{ccc} A & \longrightarrow & B \\ {\scriptstyle \mathrm{id}}\downarrow & \searrow^{\mathrm{id}} & \downarrow{\scriptstyle f} \\ A & \xrightarrow[\mathrm{id}]{} & A, \end{array}$$

to the augmentation ideal $\mathrm{fib}(f)$, regarded as an A-module.

We observe that the restriction map $\mathcal{E} \to \mathrm{Fun}(\Delta^1 \times \{1\}, \mathrm{Alg}_{\mathcal{O}}(\mathcal{C}))$ can be regarded as a pointed envelope of the presentable fibration

$$\mathrm{Fun}(\Delta^1 \times \{1\}, \mathrm{Alg}_{\mathcal{O}}(\mathcal{C})) \to \mathrm{Fun}(\{1\} \times \{1\}, \mathrm{Alg}_{\mathcal{O}}(\mathcal{C})) \simeq \mathrm{Alg}_{\mathcal{O}}(\mathcal{C}).$$

Let $\Omega^\infty_* : T_{\mathrm{Alg}_{\mathcal{O}}(\mathcal{C})} \to \mathcal{E}$ exhibit $T_{\mathrm{Alg}_{\mathcal{O}}(\mathcal{C})}$ as a tangent bundle to $\mathrm{Alg}_{\mathcal{O}}(\mathcal{C})$. Let ϕ denote the composition

$$T_{\mathrm{Alg}_{\mathcal{O}}(\mathcal{C})} \xrightarrow{\Omega^\infty} \mathcal{E} \xrightarrow{\psi} \mathcal{M}.$$

To complete the proof, it will suffice to show that ϕ is an equivalence of ∞-categories.

By construction, we have a commutative diagram

$$\begin{array}{ccccc} T_{\mathrm{Alg}_{\mathcal{O}}(\mathcal{C})} & \xrightarrow{\Omega^\infty_*} & \mathcal{E} & \xrightarrow{\phi_0} & \mathcal{M} \\ & {\scriptstyle q}\searrow & \downarrow{\scriptstyle q'} & \swarrow{\scriptstyle q''} & \\ & & \mathrm{Alg}_{\mathcal{O}}(\mathcal{C}), & & \end{array}$$

with $\phi = \phi_0 \circ \Omega^\infty_*$, where q, q', and q'' are presentable fibrations. Since Ω^∞_* is a right adjoint relative to $\mathrm{Alg}_{\mathcal{O}}(\mathcal{C})$, it carries q-Cartesian morphisms to q'-Cartesian morphisms. We observe that ϕ_0 carries q'-Cartesian morphisms to q''-Cartesian morphisms; in concrete terms, this merely translates into

小红书
小红书号:3189205503 qq

the observation that every pullback diagram

$$\begin{array}{ccc} A & \longrightarrow & B \\ \downarrow{\scriptstyle f} & & \downarrow{\scriptstyle f'} \\ A' & \longrightarrow & B' \end{array}$$

in $\mathrm{Alg}_{\mathcal{O}}(\mathcal{C})$ is also a pullback diagram in $\mathrm{Fun}_{\mathcal{O}}(\mathcal{O}, \mathcal{C})$ (Corollary 3.2.2.5), and therefore induces an equivalence $\mathrm{fib}(f) \simeq \mathrm{fib}(f')$ in $\mathcal{M}$. It follows that ϕ carries q-Cartesian morphisms to q''-Cartesian morphisms.

We now invoke Corollary HTT.2.4.4.4: the map ϕ is an equivalence of ∞-categories if and only if, for every commutative algebra object $A \in \mathrm{Alg}_{\mathcal{O}}(\mathcal{C})$, the induced map

$$\phi_A : \mathrm{Sp}(\mathrm{Alg}_{\mathcal{O}}(\mathcal{C})_{/A}) \to \mathrm{Fun}_{\mathcal{O}}(\mathcal{O}, \mathrm{Mod}^{\mathcal{O}}_A(\mathcal{C}))$$

is an equivalence of ∞-categories. We now observe that ϕ_A can be identified with the augmentation ideal functor which appears in the proof of Theorem 7.3.4.13, and therefore an equivalence as required. □

7.3.5 The Cotangent Complex of an $\mathbb{E}_k$-Algebra

Let $k \to A$ be a map of commutative rings. The multiplication map $A \otimes_k A \to A$ is a surjection whose kernel is an ideal $I \subseteq A \otimes_k A$. The quotient I/I^2 is an A-module, and there is a canonical k-linear derivation $d : A \to I/I^2$, which carries an element $a \in A$ to the image of $(a \otimes 1 - 1 \otimes a) \in I$. In fact, this derivation is *universal*: for any A-module M, composition with d induces a bijection $\mathrm{Hom}_A(I/I^2, M) \to \mathrm{Der}_k(A, M)$. In other words, the quotient I/I^2 can be identified with the module of Kähler differentials $\Omega_{A/k}$.

The above analysis generalizes in a straightforward way to the setting of associative algebras. Assume that k is a commutative ring and that A is an associative k-algebra. Let M be an A-bimodule (in the category of k-modules: that is, we require $\lambda m = m\lambda$ for $m \in M$ and $\lambda \in k$). A *k-linear derivation* from A into M is a k-linear map $d : A \to M$ satisfying the Leibniz formula $d(ab) = d(a)b + ad(b)$. If we let I denote the kernel of the multiplication map $A \otimes_k A \to A$, then I has the structure of an A-bimodule, and the formula $d(a) = a \otimes 1 - 1 \otimes a$ defines a derivation from A into M. This derivation is again universal in the following sense:

(∗) For any bimodule M, composition with d induces a bijection of $\mathrm{Hom}(I, M)$ with the set of k-linear derivations from I into M.

If A is commutative, then I/I^2 is the universal A-module map which receives an A-bimodule homomorphism from I. Consequently, (∗) can be regarded as a generalization of the formula $\Omega_{A/k} \simeq I/I^2$.

小红书 小红书号:3189205503 qq

Our goal in this section is to obtain an ∞-categorical analogue of assertion $(*)$. Rather than than working in the ordinary abelian category of k-modules, we will work with a symmetric monoidal stable ∞-category $\mathcal{C}$. In this case, we can consider algebra objects $A \in \mathrm{Alg}_{\mathcal{O}}(\mathcal{C})$ for any coherent ∞-operad $\mathcal{O}^{\otimes}$. According to Theorem 7.3.4.18, we can identify $\mathrm{Sp}(\mathrm{Alg}_{\mathcal{O}}(\mathcal{C})_{/A})$ with the stable ∞-category $\mathrm{Mod}_A^{\mathcal{O}}(\mathcal{C})$ of $\mathcal{O}$-algebra objects of $\mathcal{C}$. In particular, the absolute cotangent complex L_A can be identified an object of $\mathrm{Mod}_A^{\mathcal{O}}(\mathcal{C})$. Our goal is to obtain a concrete description of L_A in the special case where $\mathcal{O}^{\otimes} = \mathbb{E}_k^{\otimes}$ is the ∞-operad of little k-cubes.

To motivate the description, let us consider first the case where $k = 1$. In this case, we can identify $\mathrm{Mod}_A^{\mathcal{O}}(\mathcal{C})$ with the ∞-category of A-bimodule objects of $\mathcal{C}$ (see Theorem 4.4.1.28). Motivated by assertion $(*)$, we might suppose that L_A can be identified with the fiber of the multiplication map $A \otimes A \to A$ (which we regard as a map of A-bimodules). The domain of this map is the *free* A-bimodule, characterized up to equivalence by the existence of a morphism $e : \mathbf{1} \to A \otimes A$ with the property that it induces homotopy equivalences

$$\mathrm{Map}_{\mathrm{Mod}_A^{\mathcal{O}}(\mathcal{C})}(A \otimes A, M) \to \mathrm{Map}_{\mathcal{C}}(\mathbf{1}, M)$$

(here and in what follows, we will identify A-module objects of $\mathcal{C}$ with their images in $\mathcal{C}$).

Assume now that $k \geq 0$ is arbitrary, that $\mathcal{C}$ is presentable, and that the tensor product on $\mathcal{C}$ preserves colimits separately in each variable. The forgetful functor $\mathrm{Mod}_A^{\mathcal{O}}(\mathcal{C}) \to \mathcal{C}$ preserves small limits and colimits (Corollaries 3.4.3.2 and 3.4.4.6), and therefore admits a left adjoint $\mathrm{Free} : \mathcal{C} \to \mathrm{Mod}_A^{\mathcal{O}}(\mathcal{C})$ (Corollary HTT.5.5.2.9). We can formulate our main result as follows:

Theorem 7.3.5.1. *Let $\mathcal{C}^{\otimes}$ be a stable symmetric monoidal ∞-category and let $k \geq 0$. Assume that $\mathcal{C}$ is presentable and that the tensor product operation on $\mathcal{C}$ preserves colimits separately in each variable. For every $\mathbb{E}_k$-algebra object $A \in \mathrm{Alg}_{\mathbb{E}_k}(\mathcal{C})$, there is a canonical fiber sequence*

$$\mathrm{Free}(\mathbf{1}) \to A \to L_A[k]$$

in the stable ∞-category $\mathrm{Mod}_A^{\mathcal{O}}(\mathcal{C})$. Here $\mathrm{Free} : \mathcal{C} \to \mathrm{Mod}_A^{\mathcal{O}}(\mathcal{C})$ denotes the free functor described above, and the map of A-modules $\mathrm{Free}(\mathbf{1}) \to A$ is determines by the unit map $\mathbf{1} \to A$ in the ∞-category $\mathcal{C}$.

Remark 7.3.5.2. A version of Theorem 7.3.5.1 is proven in [53].

Remark 7.3.5.3. If A is an $\mathbb{E}_k$-algebra object of $\mathcal{C}$, then we can think of an A-module $M \in \mathrm{Mod}_A^{\mathbb{E}_k}(\mathcal{C})$ as an object of $\mathcal{C}$ equipped with a commuting family of (left) actions of A parametrized by the $(k-1)$-sphere of rays in the Euclidean space $\mathbf{R}^k$ which emanate from the origin. This is equivalent to the action of a single associative algebra object of $\mathcal{C}$: namely, the topological chiral homology $\int_{S^{k-1}} A$ (see the discussion at the end of §5.5.3). The free module $\mathrm{Free}(\mathbf{1})$ can be identified with $\int_{S^{k-1}} A$ itself.

小红书号:3189205503 qq

An equivalent formulation of Theorem 7.3.5.1 asserts the existence of a fiber sequence of A-modules

$$L_A \xrightarrow{\theta} \Omega^{k-1} \operatorname{Free}(\mathbf{1}) \xrightarrow{\theta'} \Omega^{k-1} A.$$

In particular, the map θ classifies a derivation d of A into $\Omega^{k-1} \operatorname{Free}(\mathbf{1})$. Informally, this derivation is determined by pairing the canonical S^{k-1}-parameter family of maps $A \to \int_{S^{k-1}} A$ with the fundamental class of S^{k-1}. Because the induced family of composite maps $A \to \int_{S^{k-1}} A \to A$ is constant, this derivation lands in the fiber of the map θ'. When $k = 1$, we can identify $F(\mathbf{1})$ with the tensor product $A \otimes A$, and our heuristic recovers the classical formula $d(a) = a \otimes 1 - 1 \otimes a$.

Remark 7.3.5.4. In the statement of Theorem 7.3.5.1, the shift $L_A[k]$ can be identified with the tensor product of L_A with the pointed space S^k, regarded as the one-point compactification of the Euclidean space $\mathbf{R}^k$. With respect to this identification, the fiber sequence of Theorem 7.3.5.1 can be constructed so as to be equivariant with respect to the group of self-homeomorphisms of $\mathbf{R}^k$ (which acts on the ∞-operad $\mathbb{E}_k$ up to coherent homotopy, as explained in §5.4.2). However, this equivariance is not apparent from the construction we present below.

We now explain how to deduce Theorem 7.3.5.1 from Theorem 5.3.2.5. Fix an $\mathbb{E}_k$-algebra $A \in \operatorname{Alg}_{\mathbb{E}_k}(\mathcal{C})$, and let $\mathcal{E} = \operatorname{Alg}_{\mathbb{E}_k}(\mathcal{C})_{A/}$. Consider the functors $X, Y, Z : \mathcal{E} \to \mathcal{S}_*$ given informally by the formulas

$$X(f : A \to B) = \Omega^n \operatorname{Map}_{\operatorname{Alg}_{\mathbb{E}_k}}(A, B) \quad Y(f : A \to B) = \mathfrak{Z}_{\mathbb{E}_k}(f)^{\times} \quad Z(f : A \to B) = B^{\times}.$$

Theorem 5.3.2.5 implies that these functors fit into a pullback diagram

$$\begin{array}{ccc} X & \longrightarrow & Y \\ \downarrow & & \downarrow \\ * & \longrightarrow & Z, \end{array}$$

where $* : \mathcal{E} \to \mathcal{S}_*$ is the constant diagram taking the value $*$. (In fact, we have a pullback diagram in the ∞-category of functors from $\mathcal{E}$ to the ∞-category $\operatorname{Mon}_{\mathbb{E}_k}(\mathcal{S})$ of $\mathbb{E}_k$-spaces, but we will not need this).

Let $\mathcal{E}' = \operatorname{Alg}_{\mathbb{E}_k}(\mathcal{C})_{A//A}$. Let $X' : \mathcal{E}' \to \mathcal{S}_*$ be the functor which assigns to a diagram

$$\begin{array}{ccccc} & & B & & \\ & \overset{f}{\nearrow} & & \searrow & \\ A & & \xrightarrow{\mathrm{id}_A} & & A \end{array}$$

the fiber of the induced map $X(f) \to X(\mathrm{id}_A)$, and let Y' and Z' be defined similarly. Using Lemma HTT.5.5.2.3 , we deduce the existence of a pullback diagram of functors

$$\begin{array}{ccc} X' & \longrightarrow & Y' \\ \downarrow & & \downarrow \\ * & \longrightarrow & Z'. \end{array}$$

小红书 小红书号:3189205503 qq

Let $\phi : \mathrm{Mod}_A^{\mathcal{O}}(\mathcal{C}) \to \mathrm{Alg}_{\mathbb{E}_k}(\mathcal{C})_{A//A}$ be the functor given informally by the formula $M \mapsto A \oplus M$ (that is, ϕ is the composition of the identification $\mathrm{Mod}_A^{\mathcal{O}}(\mathcal{C}) \simeq \mathrm{Sp}(\mathrm{Alg}_{\mathbb{E}_k}(\mathcal{C})_{/A})$ with the functor $\Omega^\infty : \mathrm{Sp}(\mathrm{Alg}_{\mathbb{E}_k}(\mathcal{C})_{/A}) \to \mathrm{Alg}_{\mathbb{E}_k}(\mathcal{C})_{A//A}$). Let $X'' = X' \circ \phi$, and define Y'' and Z'' similarly. We have a pullback diagram of functors

$$\begin{array}{ccc} X'' & \longrightarrow & Y'' \\ \downarrow & & \downarrow \\ * & \longrightarrow & Z'' \end{array}$$

from $\mathrm{Mod}_A^{\mathcal{O}}(\mathcal{C})$ to $\mathcal{S}_*$.

The functor Z'' carries an A-module M to the fiber of the map $(A \oplus M)^\times \to A^\times$, which can be identified with $\mathrm{Map}_{\mathcal{C}}(\mathbf{1}, M) \simeq \mathrm{Map}_{\mathrm{Mod}_A^{\mathbb{E}_k}(\mathcal{C})}(\mathrm{Free}(\mathbf{1}), M)$. In other words, the functor Z'' is corepresentable by the object $\mathrm{Free}(\mathbf{1}) \in \mathrm{Mod}_A^{\mathbb{E}_k}(\mathcal{C})$. Similarly, Theorem 5.3.1.30 implies that the functor Y'' is corepresentable by the object $A \in \mathrm{Mod}_A^{\mathbb{E}_k}(\mathcal{C})$. By definition, the functor X'' is corepresentable by the shifted cotangent complex $L_A[k]$. Since the Yoneda embedding for $\mathrm{Mod}_A^{\mathbb{E}_k}(\mathcal{C})$ is fully faithful, we deduce the existence of a commutative diagram of representing objects

$$\begin{array}{ccc} L_A[k] & \longleftarrow & A \\ \uparrow & & \uparrow \\ 0 & \longleftarrow & \mathrm{Free}(\mathbf{1}) \end{array}$$

which is evidently a pushout square. This yields the desired fiber sequence

$$\mathrm{Free}(\mathbf{1}) \to A \to L_A[k].$$

in $\mathrm{Mod}_A^{\mathbb{E}_k}(\mathcal{C})$.

Remark 7.3.5.5. The fiber sequence of Theorem 7.3.5.1 can be chosen to depend functorially on A (this follows from a more careful version of the construction above). We leave the details to the reader.

Remark 7.3.5.6. Let A be a commutative algebra object of $\mathcal{C}$. Then A can be regarded as an $\mathbb{E}_k$-algebra object of $\mathcal{C}$ for every nonnegative integer k. When regarded as an $\mathbb{E}_k$-algebra object, A has a cotangent complex which we will denote by $L_A^{(k)}$ (to emphasize the dependence on k). The topological chiral homology (see Definition 5.5.2.6) $\int_{S^{k-1}} A$ can be identified with the tensor product $A \otimes S^{k-1}$ (Theorem 5.5.3.8), which is the $(k-1)$-fold (unreduced) suspension $\Sigma^{k-1}A$ of A, regarded as an object of $\mathrm{CAlg}(\mathcal{C})_{/A}$. According to Theorem 7.3.5.1, we have a canonical identification $L_A^{(k)} \simeq \mathrm{fib}(\Omega^{k-1}\Sigma^{k-1}(A) \to A)$ in the ∞-category $\mathcal{C}$. Since the ∞-operad Comm is equivalent to the colimit of the ∞-operads $\mathbb{E}_k$ (see Corollary 5.1.1.5), we conclude that the *commutative* algebra cotangent complex L_A can be computed as the colimit $\varinjlim_k L_A^{(k)}$. Combining this observation with the above identification, we obtain an alternative "derivation" of the formula $\Omega^\infty\Sigma^\infty \simeq \varinjlim_k \Omega^k\Sigma^k$.

小红书
小红书号:3189205503 qq

Example 7.3.5.7. Let $\mathcal{C}$ be as in Theorem 7.3.5.1 and let $\epsilon : A \to \mathbf{1}$ be an augmented $\mathbb{E}_k$-algebra object of $\mathcal{C}$. Theorem 5.3.1.30 guarantees the existence of a Koszul dual $\mathbb{D}(A) = \mathfrak{Z}_{\mathbb{E}_k}(\epsilon)$ (see Example 5.3.1.5). Moreover, as an object of the underlying ∞-category $\mathcal{C}$, $\mathbb{D}(A)$ can be identified with a morphism object $\mathrm{Mor}_{\mathrm{Mod}_A^{\mathbb{E}_k}(\mathcal{C})}(A, \mathbf{1})$. Combining this observation with the fiber sequence of Theorem 7.3.5.1 (and observing that the morphism object $\mathrm{Mor}_{\mathrm{Mod}_A^{\mathbb{E}_k}(\mathcal{C})}(\mathrm{Free}(\mathbf{1}), \mathbf{1})$ is equivalent to $\mathbf{1}$), we obtain a fiber sequence

$$\mathrm{Mor}_{\mathrm{Mod}_A^{\mathbb{E}_k}(\mathcal{C})}(\Sigma^k L_A, \mathbf{1}) \to \mathbb{D}(A) \xrightarrow{\theta} \mathbf{1}$$

in $\mathcal{C}$. We may therefore view $\mathrm{Mor}_{\mathrm{Mod}_A^{\mathbb{E}_k}(\mathcal{C})}(\Sigma^k L_A, \mathbf{1})$ as the "augmentation ideal" of the Koszul dual $\mathbb{D}(A)$.

In heuristic terms, we can view the $\mathbb{E}_k$-algebra A as determining a "noncommutative scheme" $\mathrm{Spec}\, A$, which is equipped with a point given by the augmentation ϵ. We can think of L_A as a version of the cotangent bundle of $\mathrm{Spec}\, A$, and $\mathrm{Mor}_{\mathrm{Mod}_A^{\mathbb{E}_k}(\mathcal{C})}(L_A, \mathbf{1})$ as a version of the tangent space to $\mathrm{Spec}\, A$ at the point determined by ϵ. The above analysis shows that, up to k-fold suspension, this "tangent space" itself is the augmentation ideal in a *different* augmented $\mathbb{E}_k$-algebra object of $\mathcal{C}$ (namely, the Koszul dual algebra $\mathbb{D}(A)$). We will return to this perspective in a future work.

We close this section with an application of Theorem 7.3.5.1. Let R be an $\mathbb{E}_\infty$-ring, and let $A \in \mathrm{Alg}_R$ be an $\mathbb{E}_1$-algebra over R. By definition, A is proper (in the sense of Definition 4.6.4.2) if and only if it is perfect when regarded as an R-module: that is, if and only if its image in Mod_R is compact. We now show that the smoothness of A can also be regarded as a finiteness condition:

Proposition 7.3.5.8. *Let R be an $\mathbb{E}_\infty$-ring, and let A be an $\mathbb{E}_1$-algebra over R. Then:*

(1) *If A is compact when regarded as an object of Alg_R, then it is smooth (in the sense of Definition 4.6.4.13).*

(2) *If A is smooth and proper, then A is a compact object of Alg_R.*

Corollary 7.3.5.9. *Let R be an $\mathbb{E}_\infty$-ring, and let A be an $\mathbb{E}_1$-algebra over R. Then A is smooth and proper if and only if it is compact when viewed both as an object of Mod_R and of Alg_R.*

The proof of Proposition 7.3.5.8 will require some preliminaries. First, we introduce a bit of notation. Let $\mathcal{C}\mathrm{at}_\infty^\star$ denote the subcategory of $\mathcal{C}\mathrm{at}_\infty$ whose objects are idempotent complete ∞-categories which admit finite colimits, and whose morphisms are functors which preserve finite colimits.

Lemma 7.3.5.10. *The inclusion $\mathcal{C}\mathrm{at}_\infty^\star \hookrightarrow \mathcal{C}\mathrm{at}_\infty$ preserves filtered colimits.*

Proof. It will suffice to prove the following three assertions:

小红书号:3189205503 qq

(*a*) Suppose we are given a filtered diagram of ∞-categories $\{\mathcal{C}_\alpha\}$ having colimit $\mathcal{C}$. If each $\mathcal{C}_\alpha$ is idempotent complete and admits finite colimits, and each of the functors $\mathcal{C}_\alpha \to \mathcal{C}_\beta$ preserves finite colimits, then $\mathcal{C}$ admits finite colimits.

(*b*) In the situation of (*a*), suppose that $\mathcal{D}$ is another idempotent complete ∞-category which admits finite colimits. Then a functor $\mathcal{C} \to \mathcal{D}$ preserves finite colimits if and only if, for each index α, the composite map $\mathcal{C}_\alpha \to \mathcal{C} \to \mathcal{D}$ preserves finite colimits.

We first prove (*a*). Using Proposition HTT.5.3.1.18 , we may assume without loss of generality that our diagram is indexed by a filtered partially ordered set A. Using Proposition HTT.4.2.4.4 , we may assume that the diagram $\alpha \mapsto \mathcal{C}_\alpha$ is given by a functor from A to the ordinary category of simplicial sets. Since filtered colimits of simplicial sets are also homotopy colimits with respect to the Joyal model structure, we may identify $\mathcal{C}$ with the colimit of the diagram $\{\mathcal{C}_\alpha\}_{\alpha \in A}$, in the sense of ordinary category theory.

We next claim that for each $\alpha \in A$, the canonical map $\mathcal{C}_\alpha \to \mathcal{C}$ preserves finite colimits. To prove this, choose a finite simplicial set K and a colimit diagram $\overline{u}_\alpha : K^{\triangleright} \to \mathcal{C}_\alpha$. Let $\overline{u}$ denote the composition of $\overline{u}_\alpha$ with the canonical map $\mathcal{C}_\alpha \to \mathcal{C}$. We claim that $\overline{u}$ is a colimit diagram in $\mathcal{C}$. Let us regard $\overline{u}$ as an object of the ∞-category $\mathcal{C}_{u/}$. For each $\beta \geq \alpha$, let $\overline{u}_\beta$ denote the composition of $\overline{u}_\alpha$ with the map $\mathcal{C}_\alpha \to \mathcal{C}_\beta$ and set $u_\beta = \overline{u}_\beta | K$. Then each $\overline{u}_\beta$ is a colimit diagram, and can therefore be identified with an initial object of the ∞-category $(\mathcal{C}_\beta)_{u_\beta /}$. Since K is finite, the canonical map

$$\varinjlim_{\beta \geq \alpha} (\mathcal{C}_\beta)_{u_\beta /} \to \mathcal{C}_{u/}$$

is an equivalence, so that we can identify $\overline{u}$ with an initial object of $\mathcal{C}_{u/}$.

Now suppose we are given a finite simplicial set K and a diagram $u : K \to \mathcal{C}$. Since K is finite, we may assume without loss of generality that u factors as a composition

$$K \xrightarrow{u_\alpha} \mathcal{C}_\alpha \to \mathcal{C}$$

for some $\alpha \in A$. Since $\mathcal{C}_\alpha$ admits finite colimits, the diagram u_α admits a colimit $\overline{u}_\alpha : K^{\triangleright} \to \mathcal{C}_\alpha$. It follows from the preceding argument that the composite map $K^{\triangleright} \xrightarrow{\overline{u}_\alpha} \mathcal{C}_\alpha \to \mathcal{C}$ is a colimit diagram in $\mathcal{C}$ which extends u. This completes that $\mathcal{C}$ admits finite colimits. The idempotent completeness of $\mathcal{C}$ follows from Corollary HTT.4.4.5.21 .

We now prove (*b*). Let $\mathcal{D}$ be an ∞-category which admits finite colimits and suppose we are given a functor $f : \mathcal{C} \to \mathcal{D}$. If f preserves finite colimits, then the argument given above establishes that each composite map $f_\alpha : \mathcal{C}_\alpha \to \mathcal{C} \to \mathcal{D}$ preserves finite colimits. Conversely, suppose that each f_α preserves finite colimits, let K be a finite simplicial set, and suppose we are given a diagram $u : K \to \mathcal{C}$. Since K is finite, there exists an index $\alpha \in A$ such that u is given by a composition $K \xrightarrow{u_\alpha} \mathcal{C}_\alpha \to \mathcal{C}$. Let $\overline{u}_\alpha : K^{\triangleright} \to \mathcal{C}_\alpha$ be a colimit diagram extending u_α, and define $\overline{u}$ as before. Then $\overline{u}$ is a colimit diagram extending u. Since f_α preserves finite colimits, $f \circ \overline{u} = f_\alpha \circ \overline{u}_\alpha$ is a colimit diagram in $\mathcal{D}$. $\square$

小红书
小红书号:3189205503 qq

Lemma 7.3.5.11. *Let $q : \mathcal{C} \to \mathcal{D}$ be a coCartesian fibration of ∞-categories. Assume that:*

(*a*) *For each object $D \in \mathcal{D}$, the ∞-category $\mathcal{C}_D = q^{-1}\{D\}$ is compactly generated.*

(*b*) *For every morphism $\alpha : D \to D'$ in $\mathcal{D}$, the induced functor $\alpha_! : \mathcal{C}_D \to \mathcal{C}_{D'}$ preserves compact objects.*

(*c*) *The ∞-category $\mathcal{D}$ admits small filtered colimits.*

(*d*) *The coCartesian fibration q is classified by a functor $\chi : \mathcal{D} \to \mathcal{P}\mathrm{r}^{\mathrm{L}}$ which preserves small filtered colimits.*

Let $\mathcal{C}^c$ denote the full subcategory of $\mathcal{C}$ spanned by those objects $C \in \mathcal{C}$ which are compact when viewed as objects of $\mathcal{C}_{q(C)}$, and let $q_0 = q | \mathcal{C}^c$. Then:

(1) *The map q_0 is a coCartesian fibration.*

(2) *A morphism in $\mathcal{C}^c$ is q_0-coCartesian if and only if it is q-coCartesian (when viewed as a morphism of $\mathcal{C}$).*

(3) *Let $\chi_0 : \mathcal{D} \to \mathcal{C}\mathrm{at}_\infty$ classify the coCartesian fibration q_0. Then χ_0 preserves filtered colimits.*

Proof. Assertions (1) and (2) follow immediately from assumptions (*a*) and (*b*). We now prove (3). Let $\mathcal{X}$ denote the subcategory of $\mathcal{P}\mathrm{r}^{\mathrm{L}}$ whose objects are compactly generated ∞-categories, and whose morphisms are functors which preserve small colimits and compact objects. Assumptions (*a*) and (*b*) guarantee that the map χ takes values in $\mathcal{X} \subseteq \mathcal{P}\mathrm{r}^{\mathrm{L}}$. Note that the functor χ_0 takes values in $\mathcal{C}\mathrm{at}^{\star}_{\infty} \subseteq \mathcal{C}\mathrm{at}_\infty$

According to Lemma 5.3.2.9, the inclusion functor $\mathcal{X} \hookrightarrow \mathcal{P}\mathrm{r}^{\mathrm{L}}$ preserves small colimits. It follows from assumption (*d*) that the functor $\chi : \mathcal{D} \to \mathcal{X}$ preserves small filtered colimits.

According to Lemma 5.3.2.9, the construction $\mathcal{E} \mapsto \mathrm{Ind}(\mathcal{E})$ induces an equivalence of ∞-categories $\mathrm{Ind} : \mathcal{C}\mathrm{at}^{\star}_{\infty} \to \mathcal{X}$. Using (2), we see that the inclusion $\mathcal{C}^c \hookrightarrow \mathcal{C}$ determines a natural transformation $\chi_0 \to \chi$ in the ∞-category of functors from $\mathcal{D}$ to $\widehat{\mathcal{C}\mathrm{at}}_\infty$, which induces an equivalence $\chi \simeq \mathrm{Ind} \circ \chi_0$. It follows that the functor $\chi_0 : \mathcal{D} \to \mathcal{C}\mathrm{at}^{\star}_{\infty}$ preserves small filtered colimits. Applying Lemma 7.3.5.10, we deduce that the composite functor $\mathcal{D} \to \mathcal{C}\mathrm{at}^{\star}_{\infty} \to \mathcal{C}\mathrm{at}_\infty$ also preserves small filtered colimits. □

Lemma 7.3.5.12. *Let $\chi : \mathrm{Alg} \to \mathcal{P}\mathrm{r}^{\mathrm{L}}$ be a map classifying the forgetful functor $\mathrm{LMod}(\mathrm{Sp}) \to \mathrm{Alg}(\mathrm{Sp}) = \mathrm{Alg}$ (so that $\chi(A) = \mathrm{LMod}_A$). Then χ preserves all colimits indexed by weakly contractible simplicial sets K.*

Proof. Let us regard $\mathcal{P}\mathrm{r}^{\mathrm{L}}$ as a symmetric monoidal ∞-category (see Proposition 4.8.1.15). According to Proposition 4.8.2.18, the forgetful functor $\mathrm{Mod}_{\mathrm{Sp}}(\mathcal{P}\mathrm{r}^{\mathrm{L}}) \to \mathcal{P}\mathrm{r}^{\mathrm{L}}$ is a fully faithful embedding, whose essential image is the full subcategory of $\mathcal{P}\mathrm{r}^{\mathrm{L}}$ spanned by the presentable stable ∞-categories. We

小红书 小红书号:3189205503 qq

can identify $\mathrm{Mod}_{\mathrm{Sp}}(\mathcal{P}\mathrm{r}^{\mathrm{L}})_{\mathrm{Sp}/}$ with an ∞-category whose objects are pairs $(\mathcal{C}, C)$, where $\mathcal{C}$ is a presentable stable ∞-category and $C \in \mathcal{C}$ is an object. The functor χ factors as a composition

$$\mathrm{Alg} = \mathrm{Alg}(\mathrm{Sp}) \xrightarrow{\Theta} \mathrm{Mod}_{\mathrm{Sp}}(\mathcal{P}\mathrm{r}^{\mathrm{L}})_{\mathrm{Sp}/} \xrightarrow{\phi} \mathrm{Mod}_{\mathrm{Sp}}(\mathcal{P}\mathrm{r}^{\mathrm{L}}) \xrightarrow{\psi} \mathcal{P}\mathrm{r}^{\mathrm{L}}.$$

Here the functor Θ admits a right adjoint (which carries a pair $(\mathcal{C}, C)$ to the spectrum of endomorphisms of C; see Theorem 4.8.5.11), and therefore preserves all small colimits. The functor ϕ preserves colimits indexed by weakly contractible simplicial sets (Proposition HTT.4.4.2.9), and the functor ψ preserves all small colimits (Corollary 4.2.3.5). It follows that χ preserves colimits indexed by small weakly contractible simplicial sets. □

Lemma 7.3.5.13. *The construction $R \mapsto \mathrm{LMod}_R^{\mathrm{perf}}$ determines a functor $\mathrm{Alg} \to \mathcal{C}\mathrm{at}_\infty$ which commutes with filtered colimits.*

Proof. Combine Lemmas 7.3.5.12 and 7.3.5.11. □

Proof of Proposition 7.3.5.8. We first prove (1). Assume that $A \in \mathrm{Alg}_R$ is compact; we wish to prove that the evaluation module $A^e \in {}_{A \otimes_R A^{\mathrm{rev}}}\mathrm{BMod}_R(\mathrm{Mod}_R) \simeq \mathrm{LMod}_{A \otimes_R A^{\mathrm{rev}}}$ is left dualizable (see Proposition 4.6.4.12). The collection of left dualizable modules over $A \otimes_R A^{\mathrm{rev}}$ comprise a stable subcategory of $\mathrm{LMod}_{A \otimes_R A^{\mathrm{rev}}}$ which is closed under the formation of retracts and contains $A \otimes_R A^{\mathrm{rev}}$. Consequently, to show that A^e belongs to this subcategory, it will suffice to show that A^e is perfect: that is, that A^e is a compact object of $\mathrm{LMod}_{A \otimes_R A^{\mathrm{rev}}}$. Using Proposition 4.6.3.11, we are reduced to proving that A is compact when viewed as an object of ${}_A\mathrm{BMod}_A(\mathrm{Mod}_R)$.

Using Theorem 7.3.4.7, we can identify the ∞-category of spectrum objects $\mathrm{Sp}((\mathrm{Alg}_R)_{/A})$ with the ∞-category ${}_A\mathrm{BMod}_A(\mathrm{Mod}_R)$. Since the ∞-category Alg_R is compactly generated, the zeroth space functor $\Omega^\infty : {}_A\mathrm{BMod}_A(\mathrm{Mod}_R) \to (\mathrm{Alg}_R)_{/A}$ preserves filtered colimits, so its left adjoint $\Sigma^\infty : (\mathrm{Alg}_R)_{/A} \to {}_A\mathrm{BMod}_A(\mathrm{Mod}_R)$ preserves compact objects. In particular, if A is a compact object of Alg_R, then its absolute cotangent complex $L_A = \Sigma^\infty(A)$ is a compact object of ${}_A\mathrm{BMod}_A(\mathrm{Mod}_R)$. Theorem 7.3.5.1 supplies a cofiber sequence of A-bimodules

$$L_A \to A \otimes_R A^{\mathrm{rev}} \to A.$$

Since $A \otimes_R A^{\mathrm{rev}}$ is also a compact object of ${}_A\mathrm{BMod}_A(\mathrm{Mod}_R)$, we deduce that A is a compact object of ${}_A\mathrm{BMod}_A(\mathrm{Mod}_R)$. This completes the proof of (1).

We now prove (2). Assume that A is smooth and proper as an object of Alg_R; we wish to prove that A is a compact object of Alg_R. Using Corollary 4.8.5.6, we deduce that for every algebra object $B \in \mathrm{Alg}_R$, the canonical map

$$\mathrm{Map}_{\mathrm{Alg}(R)}(A, B) \to {}_B\mathrm{BMod}_A(\mathrm{Mod}_R) \times_{\mathrm{LMod}_B} \{B\}$$

is a homotopy equivalence.

小红书
小红书号:3189205503 qq

Let $\mathcal{Y}_B$ denote the full subcategory of ${}_B\mathrm{BMod}_A(\mathrm{Mod}_R)$ spanned by the compact objects, and observe that the canonical map $\mathrm{Map}_{\mathrm{Alg}_R}(A,B) \to {}_B\mathrm{BMod}_A(\mathrm{Mod}_R)$ carries a map $\phi : A \to B$ to the R-module spectrum B, regarded as a B-A bimodule via ϕ. This is the image of $A \in {}_A\mathrm{BMod}_A(\mathrm{Mod}_R)$ under the base change functor ${}_A\mathrm{BMod}_A(\mathrm{Mod}_R) \to {}_B\mathrm{BMod}_A(\mathrm{Mod}_R)$, and therefore a compact object of ${}_B\mathrm{BMod}_A(\mathrm{Mod}_R)$ (since A is smooth). Since A is proper, the forgetful functor ${}_B\mathrm{BMod}_A(\mathrm{Mod}_R) \to \mathrm{LMod}_B$ carries $\mathcal{Y}_B$ into $\mathrm{LMod}_B^{\mathrm{perf}}$, so that θ induces a homotopy equivalence

$$\mathrm{Map}_{\mathrm{Alg}_R}(A,B) \to \mathcal{Y}_B \times_{\mathrm{LMod}_B^{\mathrm{perf}}} \{B\}.$$

Since the constructions $B \mapsto \mathcal{Y}_B$ and $B \mapsto \mathrm{LMod}_B^{\mathrm{perf}}$ commute with filtered colimits (Lemma 7.3.5.13 and Proposition 4.6.3.11), we conclude that the functor $B \mapsto \mathrm{Map}_{\mathrm{Alg}_R}(A,B)$ commutes with filtered colimits. □

7.3.6 The Tangent Correspondence

Let $\mathcal{C}$ be an ∞-category, $T_{\mathcal{C}}$ a tangent bundle to $\mathcal{C}$ (Definition 7.3.1.9), and $L : \mathcal{C} \to T_{\mathcal{C}}$ the associated cotangent complex functor (Definition 7.3.2.14). Then there exists a coCartesian fibration $p : \mathcal{M} \to \Delta^1$ with $\mathcal{M} \times_{\Delta^1} \{0\} \simeq \mathcal{C}$, $\mathcal{M} \times_{\Delta^1} \{1\} \simeq T_{\mathcal{C}}$, such that the associated functor $\mathcal{C} \to T_{\mathcal{C}}$ can be identified with L (see §HTT.5.2.1). We will refer to $\mathcal{M}$ as a *tangent correspondence* to $\mathcal{C}$. The tangent correspondence will play an essential role in §7.4. For this reason, we devote the present section to giving an explicit construction of a tangent correspondence to $\mathcal{C}$, which we will denote by $\mathcal{M}^T(\mathcal{C})$.

Remark 7.3.6.1. Since the cotangent complex functor L admits a right adjoint, the coCartesian fibration $p : \mathcal{M} \to \Delta^1$ considered above is also a Cartesian fibration, associated to the composite functor

$$T_{\mathcal{C}} \to \mathrm{Fun}(\Delta^1, \mathcal{C}) \to \mathrm{Fun}(\{0\}, \mathcal{C}) \simeq \mathcal{C}\,.$$

Recall that a *correspondence* between a pair of ∞-categories $\mathcal{C}$ and $\mathcal{D}$ is an ∞-category $\mathcal{M}$ equipped with a functor $p : \mathcal{M} \to \Delta^1$ and isomorphisms $\mathcal{C} \simeq \mathcal{M} \times_{\Delta^1} \{0\}$ and $\mathcal{D} \simeq \mathcal{M} \times_{\Delta^1} \{1\}$. If p is a Cartesian fibration, then a correspondence determines a functor $\mathcal{D} \to \mathcal{C}$, which is well-defined up to homotopy. It is therefore reasonable to think of a correspondence as a "generalized functor". Our first result describes how to compose these "generalized functors" with ordinary functors.

Lemma 7.3.6.2. *Suppose given sequence of maps $A \xrightarrow{f} B \to \Delta^1$ in the category of simplicial sets. Let A_1 denote the fiber product $A \times_{\Delta^1} \{1\}$, and define B_1 similarly. If f is a categorical equivalence, then the induced map $A_1 \to B_1$ is a categorical equivalence.*

Proof. This follows immediately from the definition, since $\mathfrak{C}(A_1)$ and $\mathfrak{C}(B_1)$ can be identified with the full simplicial subcategories of $\mathfrak{C}(A)$ and $\mathfrak{C}(B)$ lying over the object $\{1\} \in \mathfrak{C}(\Delta^1)$. □

Proposition 7.3.6.3. *Let $\mathcal{C}$ and $\mathcal{D}$ be ∞-categories, and let $p : \mathcal{M} \to \Delta^1$ be a correspondence from $\mathcal{C}$ to $\mathcal{D}$. Let $G : \mathcal{D}' \to \mathcal{D}$ be a categorical fibration of simplicial sets. We define a new simplicial*

小红书 小红书号:3189205503 qq

set $\mathcal{M}'$ equipped with a map $p' : \mathcal{M}' \to \mathcal{M}$, so that the following universal property is satisfied: for every map of simplicial sets $A \to \Delta^1$, we have a pullback diagram of sets

$$\begin{array}{ccc} \mathrm{Hom}_{\Delta^1}(A, \mathcal{M}') & \longrightarrow & \mathrm{Hom}(A \times_{\Delta^1} \{1\}, \mathcal{D}') \\ \downarrow & & \downarrow \\ \mathrm{Hom}_{\Delta^1}(A, \mathcal{M}) & \longrightarrow & \mathrm{Hom}(A \times_{\Delta^1} \{1\}, \mathcal{D}). \end{array}$$

Then:

(1) *The map $\mathcal{M}' \to \mathcal{M}$ is an inner fibration of simplicial sets.*

(2) *The simplicial set $\mathcal{M}'$ is an ∞-category.*

(3) *Let $f : C \to D'$ be a morphism in $\mathcal{M}'$ from an object of $\mathcal{C}$ to an object of $\mathcal{D}'$. Then f is a $(p \circ p')$-Cartesian morphism of $\mathcal{M}'$ if and only if $p'(f)$ is a p-Cartesian morphism of $\mathcal{M}$.*

(4) *Assume that the map $\mathcal{M} \to \Delta^1$ is a Cartesian fibration, associated to a functor $G' : \mathcal{D} \to \mathcal{C}$. Then the composite map $\mathcal{M}' \to \mathcal{M} \to \Delta^1$ is a Cartesian fibration, associated to the functor $G' \circ G$.*

Proof. We first prove (1). We wish to show that the projection $\mathcal{M}' \to \mathcal{M}$ has the right lifting property with respect to every inclusion $A \to B$ which is a categorical equivalence of simplicial sets. Fix a map $\alpha : B \to \Delta^1$; we must show that it is possible to solve any mapping problem of the form

$$\begin{array}{ccc} A \times_{\Delta^1} \{1\} & \longrightarrow & \mathcal{D}' \\ \downarrow{\scriptstyle i} & & \downarrow{\scriptstyle G} \\ B \times_{\Delta^1} \{1\} & \longrightarrow & \mathcal{D}. \end{array}$$

Since G is assumed to be a categorical fibration, it will suffice to show that i is a categorical equivalence, which follows from Lemma 7.3.6.2. This completes the proof of (1). Assertion (2) follows immediately.

We now prove (3). Let $\overline{f}$ denote the image of f in $\mathcal{M}$. We have a commutative diagram of simplicial sets

$$\begin{array}{ccc} & \mathcal{M}_{/\overline{f}} & \\ {\scriptstyle \phi}\nearrow & & \searrow{\scriptstyle \psi} \\ \mathcal{M}'_{/f} & \longrightarrow & \mathcal{C}_{/C}. \end{array}$$

We observe that f is $(p \circ p')$-Cartesian if and only if $(\psi \circ \phi)$ is a trivial Kan fibration, and that $\overline{f}$ is p-Cartesian if and only if ψ is a trivial Kan fibration. The desired equivalence now follows from the observation that ϕ is an isomorphism.

小红书 小红书号:3189205503 qq

To prove (4), let us suppose that we are given a map $h : \mathcal{D} \times \Delta^1 \to \mathcal{M}$ which is a p-Cartesian natural transformation from G' to $\mathrm{id}_{\mathcal{D}}$. Using the definition of $\mathcal{M}'$, we see that the composition

$$\mathcal{D}' \times \Delta^1 \to \mathcal{D} \times \Delta^1 \xrightarrow{h} \mathcal{M}$$

can be lifted uniquely to a map $h' : \mathcal{D}' \times \Delta^1 \to \mathcal{M}'$ which is a natural transformation from $G' \circ G$ to $\mathrm{id}_{\mathcal{D}'}$. It follows from (3) that h' is a $(p \circ p')$-Cartesian transformation, so that $(p \circ p')$ is a Cartesian fibration associated to the functor $G' \circ G$. □

We now describe an important example of a correspondence.

Notation 7.3.6.4. Let $K \subseteq \Delta^1 \times \Delta^1$ denote the full subcategory spanned by the vertices $\{i\} \times \{j\}$ where $i \leq j$ (so that K is isomorphic to a 2-simplex Δ^2). For every simplicial set A equipped with a map $f : A \to \Delta^1$, we let $\overline{A}$ denote the inverse image of K under the induced map

$$\Delta^1 \times A \to \Delta^1 \times \Delta^1.$$

Note that the map $A \xrightarrow{(f,\mathrm{id})} \Delta^1 \times A$ factors through $\overline{A}$; we will denote the resulting inclusion by $\psi_A : A \to \overline{A}$.

Let $\mathcal{C}$ be an ∞-category. The *fundamental correspondence of* $\mathcal{C}$ is a simplicial set $\mathcal{M}^0(\mathcal{C})$ equipped with a map $p : \mathcal{M}^0(\mathcal{C}) \to \Delta^1$, characterized by the following universal property: for every map of simplicial sets $A \to \Delta^1$, we have a canonical bijection of sets

$$\mathrm{Hom}_{\Delta^1}(A, \mathcal{M}^0(\mathcal{C})) \simeq \mathrm{Hom}(\overline{A}, \mathcal{C}).$$

The inclusions $\psi_A : A \to \overline{A}$ determine a map $q : \mathcal{M}^0(\mathcal{C}) \to \mathcal{C}$. Together p and q determine a map $\mathcal{M}^0(\mathcal{C}) \to \mathcal{C} \times \Delta^1$, which we will call the *fundamental projection*.

Remark 7.3.6.5. Let $\mathcal{C}$ be an ∞-category, and let $\mathcal{M}^0(\mathcal{C})$ be its fundamental correspondence. Then the fiber $\mathcal{M}^0(\mathcal{C}) \times_{\Delta^1} \{0\}$ is canonically isomorphic to $\mathcal{C}$, and the fiber $\mathcal{M}^0(\mathcal{C}) \times_{\Delta^1} \{1\}$ is canonically isomorphic to $\mathrm{Fun}(\Delta^1, \mathcal{C})$. We will generally abuse terminology, and use these isomorphisms identify $\mathcal{C}$ and $\mathrm{Fun}(\Delta^1, \mathcal{C})$ with subsets of $\mathcal{M}^0(\mathcal{C})$. The map $q : \mathcal{M}^0(\mathcal{C}) \to \mathcal{C}$ is given by the identity on $\mathcal{C}$, and by evaluation at $\{1\} \subseteq \Delta^1$ on $\mathrm{Fun}(\Delta^1, \mathcal{C})$.

Proposition 7.3.6.6. *Let $\mathcal{C}$ be an ∞-category, let $\mathcal{M}^0(\mathcal{C})$ be the fundamental correspondence of $\mathcal{C}$, and let $\pi : \mathcal{M}^0(\mathcal{C}) \to \mathcal{C} \times \Delta^1$ denote the fundamental projection, and $p : \mathcal{M}^0(\mathcal{C}) \to \Delta^1$ the composition of π with projection onto the second factor. Then:*

(1) *The fundamental projection π is a categorical fibration. In particular, $\mathcal{M}^0(\mathcal{C})$ is an ∞-category.*

(2) *The map p is a Cartesian fibration.*

小红书
小红书号:3189205503 qq

(3) *Let $A \in \mathcal{C} \subseteq \mathcal{M}^0(\mathcal{C})$, and let $(f : B \to C) \in \mathrm{Fun}(\Delta^1, \mathcal{C}) \subseteq \mathcal{M}^0(\mathcal{C})$. Let $\alpha : A \to f$ be a morphism in $\mathcal{M}^0(\mathcal{C})$, corresponding to a commutative diagram*

$$\begin{array}{ccc} A & \xrightarrow{\overline{\alpha}} & B \\ & \searrow & \downarrow f \\ & & C \end{array}$$

in $\mathcal{C}$. Then α is p-Cartesian if and only if $\overline{\alpha}$ is an equivalence in $\mathcal{C}$.

(4) *The Cartesian fibration p is associated to the functor $\mathrm{Fun}(\Delta^1, \mathcal{C}) \to \mathcal{C}$ given by evaluation at the vertex $\{0\} \in \Delta^1$.*

(5) *The map p is also a coCartesian fibration, associated to the diagonal inclusion $\mathcal{C} \to \mathrm{Fun}(\Delta^1, \mathcal{C})$.*

The proof will require a few lemmas. In what follows, we will employ the conventions of Notation 7.3.6.4.

Lemma 7.3.6.7. *Let A be a simplicial set equipped with a map $A \to \Delta^1$, and let*

$$\widetilde{A} = (A \times \{0\}) \coprod_{A_1 \times \{0\}} (A_1 \times \Delta^1) \subseteq \overline{A}.$$

Then the inclusion $\widetilde{A} \subseteq \overline{A}$ is a categorical equivalence.

Proof. The functors $A \mapsto \widetilde{A}$ and $A \mapsto \overline{A}$ both commute with colimits. Since the class of categorical equivalences is stable under filtered colimits, we may reduce to the case where A has only finitely many simplices. We now work by induction on the dimension n of A, and the number of nondegenerate simplices of dimension n. If A is empty there is nothing to prove; otherwise there exists a pushout diagram

$$\begin{array}{ccc} \partial \Delta^n & \longrightarrow & \Delta^n \\ \downarrow & & \downarrow \\ A' & \longrightarrow & A. \end{array}$$

This induces homotopy pushout diagrams

$$\begin{array}{ccc} \overline{\partial \Delta^n} & \longrightarrow & \overline{\Delta^n} \\ \downarrow & & \downarrow \\ \overline{A}' & \longrightarrow & \overline{A} \end{array} \qquad \begin{array}{ccc} \widetilde{\partial \Delta^n} & \longrightarrow & \widetilde{\Delta^n} \\ \downarrow & & \downarrow \\ \widetilde{A}' & \longrightarrow & \widetilde{A}. \end{array}$$

It will therefore suffice to prove the lemma after replacing A by A', $\partial \Delta^n$, or Δ^n. In the first two cases this follows from the inductive hypothesis. We may therefore assume that $A = \Delta^n$. In particular, A is an ∞-category. The composite map

$$\overline{A} \subseteq A \times \Delta^1 \to \Delta^1$$

小红书
小红书号:3189205503 qq

is a Cartesian fibration associated to the inclusion $i : A_1 \to A$, and $\widetilde{A}$ can be identified with the mapping cylinder of i. The desired result now follows from Proposition HTT.3.2.2.10 . □

Lemma 7.3.6.8. *Suppose given maps of simplicial sets $A \xrightarrow{f} B \to \Delta^1$. If f is a categorical equivalence, then the induced map $\overline{A} \to \overline{B}$ is a categorical equivalence.*

Proof. Let $\widetilde{A}$ and $\widetilde{B}$ be defined as in Lemma 7.3.6.7. We have a commutative diagram

$$\begin{array}{ccc} \widetilde{A} & \xrightarrow{\widetilde{f}} & \widetilde{B} \\ \downarrow & & \downarrow \\ \overline{A} & \xrightarrow{\overline{f}} & \overline{B}, \end{array}$$

where the vertical maps are categorical equivalences by Lemma 7.3.6.7. It will therefore suffice to show that $\widetilde{f}$ is a categorical equivalence. The map $\widetilde{f}$ determines a map of homotopy pushout diagrams

$$\begin{array}{ccc} A_1 \times \{0\} & \longrightarrow & A \times \{0\} \\ \downarrow & & \downarrow \\ A_1 \times \Delta^1 & \longrightarrow & \widetilde{A} \end{array} \qquad \begin{array}{ccc} B_1 \times \{0\} & \longrightarrow & B \times \{0\} \\ \downarrow & & \downarrow \\ B_1 \times \Delta^1 & \longrightarrow & \widetilde{B}. \end{array}$$

It therefore suffices to show that the map $A_1 \to B_1$ is a categorical equivalence, which follows from Lemma 7.3.6.2. □

Proof of Proposition 7.3.6.6. We first prove (1). Consider a lifting problem

$$\begin{array}{ccc} A & \longrightarrow & \mathcal{M}^0(\mathcal{C}) \\ \downarrow{\scriptstyle i} & \nearrow & \downarrow{\scriptstyle \pi} \\ B & \longrightarrow & \mathcal{C} \times \Delta^1, \end{array}$$

where i is a monomorphism of simplicial sets. We must show that this lifting problem has a solution if i is a categorical equivalence. Unwinding the definitions (and using the conventions of Notation 7.3.6.4, we are reduced to showing that $\mathcal{C}$ has the extension property with respect to the inclusion $j : \overline{A} \coprod_A B \to \overline{B}$. For this, it suffices to show that j is a categorical equivalence. Since the Joyal model structure is left proper, it will suffice to show that the inclusion $\overline{A} \to \overline{B}$ is a categorical equivalence, which follows from Lemma 7.3.6.8.

We next prove (3). Let us identify α with a 2-simplex in $\mathcal{C}$. Unwinding the definitions, we see that α is p-Cartesian if and only if the map $\phi : \mathcal{C}_{/\alpha} \to \mathcal{C}_{/f}$ is a trivial Kan fibration. In view of Proposition HTT.1.2.4.3 , this is equivalent to the requirement that the map $A \to B$ be an equivalence in $\mathcal{C}_{/C}$, which is equivalent to the requirement that $\overline{\alpha}$ be an equivalence in $\mathcal{C}$ (Proposition HTT.1.2.13.8).

小红书 小红书号:3189205503 qq

We now prove (2). Since p is the composition of π with the projection map $\mathcal{C} \times \Delta^1 \to \Delta^1$, we deduce immediately that p is an inner fibration. To show that p is a Cartesian fibration, it will suffice to show that for every object $X \in \mathcal{M}^0(\mathcal{C})$ and every morphism $\overline{\alpha} : y \to p(x)$ in Δ^1, there exists a p-Cartesian morphism $\alpha : Y \to X$ lifting $\overline{\alpha}$. If $\overline{\alpha}$ is degenerate, we can choose α to be degenerate. We may therefore assume that $X \in \mathrm{Fun}(\Delta^1, \mathcal{C})$ classifies a map $B \to C$ in $\mathcal{C}$. We can then choose α to classify the diagram

$$\begin{array}{ccc} B & \xrightarrow{\mathrm{id}} & B \\ & \searrow & \downarrow \\ & & C. \end{array}$$

It follows from (3) that α is p-Cartesian.

Let $G : \mathrm{Fun}(\Delta^1, \mathcal{C}) \to \mathcal{C}$ denote the functor given by evaluation at the vertex $\{0\}$. To prove (4), we must exhibit a p-Cartesian natural transformation $h : \Delta^1 \times \mathrm{Fun}(\Delta^1, \mathcal{C}) \to \mathcal{M}^0(\mathcal{C})$ from G to $\mathrm{id}_{\mathrm{Fun}(\Delta^1, \mathcal{C})}$. We now choose h to classify the composite map

$$K \times \mathrm{Fun}(\Delta^1, \mathcal{C}) \overset{(h_0, \mathrm{id})}{\longrightarrow} \Delta^1 \times \mathrm{Fun}(\Delta^1, \mathcal{C}) \to \mathcal{C}$$

where K is defined as in Notation 7.3.6.4, and $h_0 : K \simeq \Delta^2 \to \Delta^1$ is the map which collapses the edge $\Delta^{\{0,1\}} \subseteq \Delta^2$. It follows from (3) that h is a Cartesian transformation with the desired properties.

We now prove (5). Let $F : \mathcal{C} \to \mathrm{Fun}(\Delta^1, \mathcal{C})$ denote the diagonal embedding. The $G \circ F = \mathrm{id}_{\mathcal{C}}$. The identity map $\mathrm{id}_{\mathcal{C}} \to G \circ F$ is the unit for an adjunction between G and F. Thus p is also a coCartesian fibration, associated to the functor F, as desired. □

Definition 7.3.6.9. Let $\mathcal{C}$ be a presentable ∞-category and let $G : T_{\mathcal{C}} \to \mathrm{Fun}(\Delta^1, \mathcal{C})$ be a tangent bundle to $\mathcal{C}$. We define the *tangent correspondence* $\mathcal{M}^T(\mathcal{C})$ to be the result of applying the construction of Proposition 7.3.6.3 using the fundamental correspondence $\mathcal{M}^0(\mathcal{C})$ and the functor G. By construction, $\mathcal{M}^T(\mathcal{C})$ is equipped with a projection map $\pi : \mathcal{M}^T(\mathcal{C}) \to \Delta^1 \times \mathcal{C}$.

Remark 7.3.6.10. The terminology of Definition 7.3.6.9 is slightly abusive: the tangent correspondence $\mathcal{M}^T(\mathcal{C})$ depends on a choice of tangent bundle $T_{\mathcal{C}} \to \mathrm{Fun}(\Delta^1, \mathcal{C})$. However, it is easy to eliminate this ambiguity: for example, we can use an explicit construction of $T_{\mathcal{C}}$ (see Proposition 7.3.1.10).

The following result is an immediate consequence of Propositions 7.3.6.6, Proposition 7.3.6.3, and the definition of the cotangent complex functor L:

Proposition 7.3.6.11. *Let $\mathcal{C}$ be a presentable ∞-category. Then:*

(1) *The projection $\mathcal{M}^T(\mathcal{C}) \to \Delta^1 \times \mathcal{C}$ is a categorical fibration.*

小红书
小红书号:3189205503 qq

(2) *The composite map* $p : \mathcal{M}^T(\mathcal{C}) \to \Delta^1 \times \mathcal{C} \to \Delta^1$ *is a Cartesian fibration, associated to the functor*

$$T_{\mathcal{C}} \to \mathrm{Fun}(\Delta^1, \mathcal{C}) \to \mathrm{Fun}(\{0\}, \mathcal{C}) \simeq \mathcal{C}\,.$$

(3) *The map* p *is also a coCartesian fibration, associated to the cotangent complex functor* $L : \mathcal{C} \to T_{\mathcal{C}}$.

7.4 Deformation Theory

In §7.3, we studied the general formalism of cotangent complexes. For every presentable ∞-category $\mathcal{C}$, we defined the tangent bundle $T_{\mathcal{C}}$ and a relative cotangent complex functor $\mathrm{Fun}(\Delta^1, \mathcal{C}) \to T_{\mathcal{C}}$

$$(f : A \to B) \mapsto L_{B/A} \in \mathrm{Sp}(\mathcal{C}^{/B}).$$

In this section, we will specialize to the situation where $\mathcal{C}$ is the ∞-category CAlg of $\mathbb{E}_\infty$-rings. In this case, Theorem 7.3.4.18 allows us to identify the tangent bundle $T_{\mathcal{C}}$ with the ∞-category of pairs (A, M), where A is an $\mathbb{E}_\infty$-ring and M is an A-module. We will henceforth use this identification to view the relative cotangent complex $L_{B/A}$ as taking its value in the ∞-category Mod_B of B-module spectra.

The basic idea we emphasize in this section is that the theory of the relative cotangent complex "controls" the deformation theory of $\mathbb{E}_\infty$-rings. In §7.4.1, we will make this precise by introducing the notion of a *square-zero extension* of $\mathbb{E}_\infty$-rings. To every map $\phi : A \to B$ of $\mathbb{E}_\infty$-rings and every map of B-modules $\eta : L_{B/A} \to M$, we will associate a new A-algebra B^η equipped with a map $B^\eta \to B$: roughly speaking, B^η is given by the fiber of the A-linear derivation $B \to M$ determined by η. We say that a map $\widetilde{B} \to B$ is a square-zero extension if it arises via this construction. Our main result asserts that a large class of morphisms can be obtained as square zero extensions: for example, the Postnikov tower of a connective $\mathbb{E}_\infty$-ring B is given by successive square-zero extensions

$$\cdots \to \tau_{\leq 2} B \to \tau_{\leq 1} B \to \tau_{\leq 0} B.$$

Suppose we are given a square-zero extension $\mathbb{E}_\infty$-rings $\widetilde{A} \to A$. In this case, there is a close relationship between $\mathbb{E}_\infty$-algebras over $\widetilde{A}$ and $\mathbb{E}_\infty$-algebras over A. Every $\mathbb{E}_\infty$-algebra $\widetilde{B}$ over $\widetilde{A}$ determines an $\mathbb{E}_\infty$-algebra $B = \widetilde{B} \otimes_{\widetilde{A}} A$. Under some mild connectivity assumptions, we will see that $\widetilde{B}$ can be recovered as a square-zero extension of B. This leads to an algebraic version of Kodaira-Spencer theory, which reduces the classification of $\mathbb{E}_\infty$-algebras over $\widetilde{A}$ to the classification over A, together with a "linear" problem involving the relative cotangent complex (see Theorem 7.4.2.7).

In §7.4.3, will study connectivity and finiteness properties of the relative cotangent complex $L_{B/A}$ associated to a morphism $\phi : A \to B$ between connective $\mathbb{E}_\infty$-rings. It is not difficult to show that finiteness properties of f are inherited by the relative cotangent complex $L_{B/A}$. For example,

小红书
小红书号:3189205503 qq

if f is of finite presentation, then the relative cotangent complex $L_{B/A}$ is a perfect B-module. We will see that the converse holds under some mild additional assumptions (Theorem 7.4.3.18).

Remark 7.4.0.1. There is a voluminous literature on deformation theory in the setting of ordinary commutative algebra and in algebraic geometry. Some references include [97], [75], and [76].

7.4.1 Square-Zero Extensions

Let R be a commutative ring. A *square-zero extension* of R is a commutative ring $\widetilde{R}$ equipped with a surjection $\phi : \widetilde{R} \to R$, with the property that the product of any two elements in $\ker(\phi)$ is zero. In this case, the kernel $M = \ker(\phi)$ inherits the structure on R-module.

Let $\widetilde{R}$ be a square-zero extension of a commutative ring R by an R-module M. There exists a ring homomorphism

$$(R \oplus M) \times_R \widetilde{R} \to \widetilde{R},$$

given by the formula

$$(r, m, \widetilde{r}) \mapsto \widetilde{r} + m.$$

This map exhibits $\widetilde{R}$ as endowed with an *action* of $R \oplus M$ in the category of commutative rings with a map to R (we observe that $R \oplus M$ has the structure of an abelian group object in this category). Consequently, in some sense square-zero extensions of R by M can be viewed as *torsors* for the trivial square-zero extension $R \oplus M$.

In general, if $\phi : \widetilde{R} \to R$ is a square-zero extension of R by $M \simeq \ker(\phi)$, we say that $\widetilde{R}$ is *trivial* if ϕ admits a section. In this case, a choice of left inverse to ϕ determines an isomorphism $\widetilde{R} \simeq R \oplus M$. Such an isomorphism need not exist (for example, we could take $R = \mathbf{Z}/p\mathbf{Z}$ and $\widetilde{R} = \mathbf{Z}/p^2\mathbf{Z}$), and need not be unique. However, any two sections of ϕ differ by a derivation from R into M, which is classified by an R-linear map from the module of Kähler differentials Ω_R into M. Conversely, any derivation of R into M determines an automorphism of $\widetilde{R}$ (whether $\widetilde{R}$ is trivial or not), which permutes the set of sections of ϕ. Consequently, we deduce that the *automorphism group* of the trivial square zero extension of R by M can be identified with the group of R-module homomorphisms $\mathrm{Ext}^0_R(\Omega_R, M)$.

It is tempting to try to pursue this analogy further, and to try identify the *isomorphism classes* of square-zero extensions of R by M with the higher Ext-group $\mathrm{Ext}^1_R(\Omega_R, M)$. Given an extension class $\eta \in \mathrm{Ext}^1_R(\Omega_R, M)$, we can indeed construct a square-zero extension $\widetilde{R}$ of R by M. Indeed, let us view η as defining an exact sequence

$$0 \to M \to \widetilde{M} \xrightarrow{f} \Omega_R \to 0$$

小红书
小红书号:3189205503 qq

in the category of R-modules. We now form a pullback diagram

$$\begin{array}{ccc} \widetilde{R} & \longrightarrow & R \\ \downarrow & & \downarrow{\scriptstyle d} \\ \widetilde{M} & \longrightarrow & \Omega_R \end{array}$$

in the category of abelian groups. We can identify elements of $\widetilde{R}$ with pairs $(r, \widetilde{m})$, where $r \in R$ and $\widetilde{m} \in \widetilde{M}$ satisfy the equation $f(\widetilde{m}) = dr$. The abelian group $\widetilde{R}$ admits a ring structure, given by the formula

$$(r, \widetilde{m})(r', \widetilde{m}') = (rr', r'\widetilde{m} + r\widetilde{m}').$$

It is easy to check that $\widetilde{R}$ is a square-zero extension of R by M. However, not every square-zero extension of R by M can be obtained from this construction. In order to obtain *all* square-zero extensions of R, it is necessary to replace the module of Kähler differentials Ω_R by a more refined invariant, such as the $\mathbb{E}_\infty$-ring cotangent complex L_R.

Our goal in this section is to study analogues of all of the ideas sketched above in the setting of $\mathbb{E}_\infty$-rings. Roughly speaking, we will mimic the above construction to produce a functor $\Phi : \mathcal{D}\mathrm{er} \to \mathrm{Fun}(\Delta^1, \mathrm{CAlg})$. Here $\mathcal{D}\mathrm{er}$ denotes an ∞-category of triples (A, M, η), where A is an $\mathbb{E}_\infty$-ring, M is an A-module, and $\eta : A \to M[1]$ is a derivation (which we can identify with a morphism of A-modules L_A into $M[1]$). The functor Φ carries (A, M, η) to a map $A^\eta \to A$; here we will refer to A^η as *the square-zero extension of A classified by η.*

Using this definition, it follows more or less tautologically that square-zero extensions of an $\mathbb{E}_\infty$-ring A are "controlled" by the absolute cotangent complex of L_A. For example, if L_A vanishes, then every square-zero extension of A by an A-module M is equivalent to the trivial extension $A \oplus M$ constructed in §7.3.4. The trouble with this approach is that it is not obvious how to give an *intrinsic* characterization of the class of square-zero extensions. For example, suppose that $f : \widetilde{A} \to A$ is a square-zero extension of A by an A-module M. We then have a canonical identification $M \simeq \mathrm{fib}(f)$ in the ∞-category of $\widetilde{A}$-modules. However, in general there is no way to recover the A-module structure on $\mathrm{fib}(f)$ from the morphism f alone. In other words, the functor Φ described above fails to be fully faithful. We can remedy the situation by studying a more restricted class of morphisms between $\mathbb{E}_\infty$-rings, which we call *n-small extensions*. This collection of morphisms has two important features:

(*i*) Given a map $f : \widetilde{A} \to A$, it is easy to decide whether or not f is an n-small extension. Namely, one must check that the fiber $\mathrm{fib}(f)$ has certain connectivity properties, and that a certain bilinear map $\pi_n \mathrm{fib}(f) \times \pi_n \mathrm{fib}(f) \to \pi_{2n} \mathrm{fib}(f)$ vanishes.

(*ii*) On the class of n-small extensions of $\mathbb{E}_\infty$-rings, one can construct an inverse to the functor Φ (Theorem 7.4.1.26). In particular, every n-small extension is a square-zero extension.

小红书
小红书号:3189205503 qq

In conjunction, (i) and (ii) imply that square-zero extensions exist in abundance. For example, if A is a connective $\mathbb{E}_\infty$-ring, then the Postnikov tower

$$\ldots \to \tau_{\leq 2} A \to \tau_{\leq 1} A \to \tau_{\leq 0} A$$

is a sequence of square-zero extensions.

We begin by defining the notion of a square-zero extension in an arbitrary presentable ∞-category $\mathcal{C}$. Although we are primarily interested in the case where $\mathcal{C} = \mathrm{CAlg}$ is the ∞-category of $\mathbb{E}_\infty$-rings, the theory we develop here also has many applications in "nonlinear" settings. For example, when $\mathcal{C}$ is the ∞-category of spaces, it can be regarded as a generalization of classical obstruction theory.

Definition 7.4.1.1. Let $\mathcal{C}$ be a presentable ∞-category, and let $p : \mathcal{M}^T(\mathcal{C}) \to \Delta^1 \times \mathcal{C}$ denote a tangent correspondence to $\mathcal{C}$ (see Definition 7.3.6.9). A *derivation* in $\mathcal{C}$ is a map $f : \Delta^1 \to \mathcal{M}^T(\mathcal{C})$ such that $p \circ f$ coincides with the inclusion $\Delta^1 \times \{A\} \subseteq \Delta^1 \times \mathcal{C}$, for some $A \in \mathcal{C}$. In this case, we will identify f with a morphism $\eta : A \to M$ in $\mathcal{M}^T(\mathcal{C})$, where $M \in T_{\mathcal{C}} \times_{\mathcal{C}} \{A\} \simeq \mathrm{Sp}(\mathcal{C}^{/A})$. We will also say that $\eta : A \to M$ is a *derivation of A into M*.

We let $\mathcal{D}\mathrm{er}(\mathcal{C})$ denote the fiber product $\mathrm{Fun}(\Delta^1, \mathcal{M}^T(\mathcal{C})) \times_{\mathrm{Fun}(\Delta^1, \Delta^1 \times \mathcal{C})} \mathcal{C}$. We will refer to $\mathcal{D}\mathrm{er}(\mathcal{C})$ as *the ∞-category of derivations in $\mathcal{C}$*.

Remark 7.4.1.2. In the situation of Definition 7.4.1.1, let $L : \mathcal{C} \to T_{\mathcal{C}}$ be a cotangent complex functor. A derivation $\eta : A \to M$ can be identified with a map $d : L_A \to M$ in the fiber $T_{\mathcal{C}} \times_{\mathcal{C}} \{A\} \simeq \mathrm{Sp}(\mathcal{C}^{/A})$. We will often abuse terminology by identifying η with d, and referring to d as a *derivation of A into M*.

Definition 7.4.1.3. Let $\mathcal{C}$ be a presentable ∞-category, and let $p : \mathcal{M}^T(\mathcal{C}) \to \Delta^1 \times \mathcal{C}$ be a tangent correspondence for $\mathcal{C}$. An *extended derivation* is a diagram σ

$$\begin{array}{ccc} \widetilde{A} & \xrightarrow{f} & A \\ \downarrow & & \downarrow{\scriptstyle \eta} \\ 0 & \longrightarrow & M \end{array}$$

in $\mathcal{M}^T(\mathcal{C})$ with the following properties:

(1) The diagram σ is a pullback square.

(2) The objects $\widetilde{A}$ and A belong to $\mathcal{C} \subseteq \mathcal{M}^T(\mathcal{C})$, while 0 and M belong to $T_{\mathcal{C}} \subseteq \mathcal{M}^T(\mathcal{C})$.

(3) Let $\overline{f} : \Delta^1 \to \mathcal{C}$ be the map which classifies the morphism f appearing in the diagram above, and let $e : \Delta^1 \times \Delta^1 \to \Delta^1$ be the unique map such that $e^{-1}\{0\} = \{0\} \times \{0\}$. Then the

小红书
小红书号:3189205503 qq

diagram

$$\begin{array}{ccccc} \Delta^1 \times \Delta^1 & \xrightarrow{\sigma} & \mathcal{M}^T(\mathcal{C}) & \xrightarrow{p} & \Delta^1 \times \mathcal{C} \\ \downarrow{\scriptstyle e} & & & & \downarrow \\ \Delta^1 & & \xrightarrow{\overline{f}} & & \mathcal{C} \end{array}$$

is commutative.

(4) The object $0 \in T_{\mathcal{C}}$ is a zero object of $\mathrm{Sp}(\mathcal{C}^{/A})$. Equivalently, 0 is a p-initial vertex of $\mathcal{M}^T(\mathcal{C})$.

We let $\widetilde{\mathcal{D}\mathrm{er}}(\mathcal{C})$ denote the full subcategory of

$$\mathrm{Fun}(\Delta^1 \times \Delta^1, \mathcal{M}^T(\mathcal{C})) \times_{\mathrm{Fun}(\Delta^1 \times \Delta^1, \Delta^1 \times \mathcal{C})} \mathrm{Fun}(\Delta^1, \mathcal{C})$$

spanned by the extended derivations.

If σ is an extended derivation in $\mathcal{C}$, then η is a derivation in $\mathcal{C}$. We therefore obtain a restriction functor

$$\widetilde{\mathcal{D}\mathrm{er}}(\mathcal{C}) \to \mathcal{D}\mathrm{er}(\mathcal{C}).$$

Let $\mathcal{C}$ and $\mathcal{M}^T(\mathcal{C})$ be above, and let

$$\sigma \in \mathrm{Fun}(\Delta^1 \times \Delta^1, \mathcal{M}^T(\mathcal{C})) \times_{\mathrm{Fun}(\Delta^1 \times \Delta^1, \Delta^1 \times \mathcal{C})} \mathrm{Fun}(\Delta^1, \mathcal{C}).$$

Then σ automatically satisfies conditions (2) and (3) of Definition 7.4.1.3. Moreover, σ satisfies condition (4) if and only if σ is a p-left Kan extension of $\sigma|\{1\} \times \Delta^1$ at the object $\{0\} \times \{1\}$. Invoking Proposition HTT.4.3.2.15 twice, we deduce the following:

Lemma 7.4.1.4. *Let $\mathcal{C}$ be a presentable ∞-category. Then the forgetful $\psi : \widetilde{\mathcal{D}\mathrm{er}}(\mathcal{C}) \to \mathcal{D}\mathrm{er}(\mathcal{C})$ is a trivial Kan fibration.*

Notation 7.4.1.5. Let $\mathcal{C}$ be a presentable ∞-category. We let $\Phi : \mathcal{D}\mathrm{er}(\mathcal{C}) \to \mathrm{Fun}(\Delta^1, \mathcal{C})$ denote the composition

$$\mathcal{D}\mathrm{er}(\mathcal{C}) \to \widetilde{\mathcal{D}\mathrm{er}}(\mathcal{C}) \to \mathrm{Fun}(\Delta^1, \mathcal{C}),$$

where the first map is a section of the trivial fibration $\widetilde{\mathcal{D}\mathrm{er}}(\mathcal{C}) \to \mathcal{D}\mathrm{er}(\mathcal{C})$, and the second map is induced by the inclusion $\Delta^1 \times \{0\} \subseteq \Delta^1 \times \Delta^1$. In other words, Φ associates to every derivation $\eta : A \to M$ a map $f : \widetilde{A} \to A$ which fits into a pullback diagram

$$\begin{array}{ccc} \widetilde{A} & \xrightarrow{f} & A \\ \downarrow & & \downarrow{\scriptstyle \eta} \\ 0 & \longrightarrow & M \end{array}$$

in the ∞-category $\mathcal{M}^T(\mathcal{C})$.

小红书
小红书号:3189205503 qq

Definition 7.4.1.6. Let $\mathcal{C}$ be a presentable ∞-category, and let $\Phi : \mathcal{D}er(\mathcal{C}) \to \mathrm{Fun}(\Delta^1, \mathcal{C})$ be the functor described in Notation 7.4.1.5. We will denote the image of a derivation $(\eta : A \to M) \in \mathcal{D}er(\mathcal{C})$ under the functor Φ by $(A^\eta \to A)$.

Let $f : \widetilde{A} \to A$ be a morphism in $\mathcal{C}$. We will say that f is a *square-zero extension* if there exists a derivation $\eta : A \to M$ in $\mathcal{C}$ and an equivalence $\widetilde{A} \simeq A^\eta$ in the ∞-category $\mathcal{C}^{/A}$. In this case, we will also say that $\widetilde{A}$ is a *square-zero extension of A by $M[-1]$*.

Remark 7.4.1.7. Let $\eta : A \to M$ be a derivation in a presentable ∞-category $\mathcal{C}$, and let $A \oplus M$ denote the image of M under the functor $\Omega^\infty : \mathrm{Sp}(\mathcal{C}^{/A}) \to \mathcal{C}$. Using Proposition HTT.4.3.1.9 , we conclude that there is a pullback diagram

$$\begin{array}{ccc} A^\eta & \longrightarrow & A \\ \downarrow & & \downarrow{\scriptstyle d_\eta} \\ A & \xrightarrow{d_0} & A \oplus M \end{array}$$

in the ∞-category $\mathcal{C}$. Here we identify d_0 with the map associated to the zero derivation $L_A \to M$.

Remark 7.4.1.8. In the situation of Remark 7.4.1.7, let B be another object of $\mathcal{C}$. We have a pullback diagram of mapping spaces

$$\begin{array}{ccc} \mathrm{Map}_{\mathcal{C}}(B, A^\eta) & \longrightarrow & \mathrm{Map}_{\mathcal{C}}(B, A) \\ \downarrow & & \downarrow \\ \mathrm{Map}_{\mathcal{C}}(B, A) & \longrightarrow & \mathrm{Map}_{\mathcal{C}}(B, A \oplus M). \end{array}$$

Fix a map $\phi : B \to A$ in $\mathcal{C}$, and let $\phi^* : \mathrm{Sp}(\mathcal{C}^{/B}) \to \mathrm{Sp}(\mathcal{C}^{/A})$ denote the functor induced by ϕ, so that ϕ determines a map $\eta' : \phi^* L_B \to L_A \xrightarrow{\eta} M$. It follows that the fiber product $\mathrm{Map}_{\mathcal{C}}(B, A^\eta) \times_{\mathrm{Map}_{\mathcal{C}}(B,A)} \{\phi\}$ can be identified with the space of paths from 0 to η' in $\mathrm{Map}_{\mathrm{Sp}(\mathcal{C}^{/A})}(\phi^* L_B, M)$.

Example 7.4.1.9. Let $\mathcal{C}$ be a presentable ∞-category containing an object A. Let $M \in \mathrm{Sp}(\mathcal{C}^{/A})$, and let $\eta : A \to M$ be the derivation classified by the zero map $L_A \to M$ in $\mathrm{Sp}(\mathcal{C}^{/A})$. Since the functor $\Omega^\infty : \mathrm{Sp}(\mathcal{C}^{/A}) \to \mathcal{C}^{/A}$ preserves small limits, we conclude from Remark 7.4.1.7 that the square-zero extension A^η can be identified with $\Omega^\infty M[-1]$. In particular, if $M = 0$, then the canonical map $A^\eta \to A$ is an equivalence, so we can identify A^η with A.

Warning 7.4.1.10. Let $\mathcal{C}$ be a presentable ∞-category, and let $f : \widetilde{A} \to A$ be a morphism in $\mathcal{C}$. Suppose f is a square-zero extension, so that there exists a map $\eta : L_A \to M$ in $\mathrm{Sp}(\mathcal{C}_{/A})$ and an equivalence $\widetilde{A} \simeq A^\eta$. In this situation, the object M and the map η need not be uniquely determined, even up to equivalence. However, this is true in some favorable situations; see Theorem 7.4.1.26.

小红书
小红书号:3189205503 qq

Example 7.4.1.11. Suppose we are given a fibration of simply connected spaces

$$F \to E \xrightarrow{f} B,$$

such that $\pi_k F \simeq *$ for all $k \neq n$. In this case, the fibration f is *classified* by a map η from B into an Eilenberg-MacLane space $K(A, n+1)$, where $A = \pi_n F$. It follows that we have a homotopy pullback diagram

$$\begin{array}{ccc} E & \xrightarrow{f} & B \\ \downarrow & & \downarrow{\scriptstyle (\mathrm{id},\eta)} \\ B & \xrightarrow{(\mathrm{id},0)} & B \times K(A, n+1). \end{array}$$

The space $B \times K(A, n+1)$ is an infinite loop object of the ∞-category of spaces over B: it has deloopings given by $K(A, n+m)$ for $m \geq 1$. Consequently, the above diagram exhibits E as a square-zero extension of B in the ∞-category of spaces.

In fact, using a slightly more sophisticated version of the same construction, one can show that the same result holds without any assumptions of simple-connectedness; moreover it is sufficient that the homotopy groups of F be confined to a small range, rather than a single degree.

Our ultimate goal in this section is to show that, in the setting of $\mathbb{E}_\infty$-rings, square-zero extensions exist in abundance. For example, if A is a connective $\mathbb{E}_\infty$-ring, then the Postnikov tower

$$\ldots \to \tau_{\leq 2} A \to \tau_{\leq 1} A \to \tau_{\leq 0} A,$$

consists of square-zero extensions.

We begin by considering the case of associative algebra objects. Let $\mathcal{C}$ be a presentable stable ∞-category, and assume that $\mathcal{C}$ is equipped with monoidal structure such that the tensor product functor $\otimes : \mathcal{C} \times \mathcal{C} \to \mathcal{C}$ preserves small colimits separately in each variable. According to Theorem 7.3.4.13, for any associative algebra object $A \in \mathcal{C}$, we have a canonical equivalence

$$\mathrm{Sp}(\mathrm{Alg}(\mathcal{C})_{/A}) \simeq \mathrm{Mod}_A^{\mathrm{Assoc}}(\mathcal{C}) \simeq {}_A\mathrm{BMod}_A(\mathcal{C}).$$

If A is an associative algebra object of $\mathcal{C}$, we let L_A denote its absolute cotangent complex (viewed as an object of ${}_A\mathrm{BMod}_A(\mathcal{C})$). Given a map of associative algebras $f : A \to B$, we let $L_{B/A} \in {}_B\mathrm{BMod}_B(\mathcal{C})$ denote the relative cotangent complex of f.

Remark 7.4.1.12. Applying Theorem 7.3.5.1 in the monoidal ∞-category ${}_A\mathrm{BMod}_A(\mathcal{C})$, we deduce the existence of a canonical fiber sequence

$$L_{B/A} \to B \otimes_A B \to B.$$

Let $f : A \to B$ be a map of associative algebra objects of $\mathcal{C}$. The fiber I of f can be identified with the limit of a diagram

$$A \xrightarrow{f} B \leftarrow 0,$$

小红书
小红书号:3189205503 qq

which we can view as a diagram of nonunital algebra objects of the monoidal ∞-category ${}_A\mathrm{BMod}_A(\mathcal{C})$ of A-bimodule objects of $\mathcal{C}$. It follows that I inherits the structure of a nonunital algebra in ${}_A\mathrm{BMod}_A(\mathcal{C})$. In particular, I has the structure of an A-bimodule, and there is a natural multiplication map $m : I \otimes_A I \to I$.

Remark 7.4.1.13. In the above situation, the multiplication $I \otimes_A I$ is given by the composition

$$I \otimes_A I \to I \otimes_A A \simeq I.$$

Our next result can be regarded as a partial justification for the terminology "square-zero extension".

Proposition 7.4.1.14. *Let $\mathcal{C}$ be a presentable stable ∞-category equipped with a monoidal structure which preserves colimits separately in each variable, let $f : A^\eta \to A$ be a square-zero extension in $\mathrm{Alg}(\mathcal{C})$, and let I denote the fiber of f. Then the multiplication map $\theta : I \otimes_{A^\eta} I \to I$ is nullhomotopic (as a map of A^η-bimodules).*

Proof. Without loss of generality, we may assume that A^η is a square-zero extension classified by a derivation $\eta : L_A \to M[1]$, for some A-A-bimodule $M \in {}_A\mathrm{BMod}_A(\mathcal{C})$. We have a pullback diagram of associative algebras

$$\begin{array}{ccc} A^\eta & \longrightarrow & A \\ \downarrow & & \downarrow \\ A & \xrightarrow{f'} & A \oplus M[1]. \end{array}$$

Then $I \simeq M$, and the multiplication map θ factors as a composition

$$I \otimes_{A^\eta} I \to M \otimes_A M \xrightarrow{\theta'} M$$

where θ' is the map of A-bimodules determined by the multiplication on the fiber of f'. According to Remark 7.4.1.13, θ' is obtained from the map $\theta'' : M \to A$ by tensoring over A with M. It will therefore suffice to show that θ'' is nullhomotopic (as a map of A-bimodules). This follows from the observation that f' admits a left inverse (as a morphism in $\mathrm{Alg}(\mathcal{C})_{A/}$, and therefore also as a map of A-bimodules). □

Proposition 7.4.1.15. *Let $\mathcal{C}$ be a presentable stable ∞-category equipped with a monoidal structure for which the tensor product preserves small colimits separately in each variable. Let $f : A \to B$ be a map of associative algebra objects of $\mathcal{C}$, let $\eta : B \to B \oplus L_{B/A}$ be the universal derivation, and factor f as a composition $A \xrightarrow{f'} B^\eta \xrightarrow{f''} B$. Then there is a fiber sequence of A-A-bimodules*

$$\mathrm{fib}(f) \otimes_A \mathrm{fib}(f) \xrightarrow{\alpha} \mathrm{fib}(f) \xrightarrow{\beta} \mathrm{fib}(f''),$$

where α is given by the multiplication on $\mathrm{fib}(f)$.

小红书
小红书号:3189205503 qq

Proof. Remark 7.4.1.12 supplies an identification of $L_{B/A}$ with the fiber of the multiplication map $m : B \otimes_A B \to B$. Note that m admits a left inverse s, given by

$$B \simeq B \otimes_A A \xrightarrow{\mathrm{id} \otimes f} B \otimes_A B.$$

It follows that $L_{B/A} \simeq \mathrm{fib}(m) \simeq \mathrm{cofib}(s) \simeq B \otimes_A \mathrm{cofib}(f)$. In particular, $\mathrm{fib}(f'') \simeq L_{B/A}[-1] \simeq B \otimes_A \mathrm{fib}(f)$. Under this identification, the map β is obtained from f by tensoring over A with $\mathrm{fib}(f)$. It follows that $\mathrm{fib}(\beta) \simeq \mathrm{fib}(f) \otimes_A \mathrm{fib}(f)$. Using Remark 7.4.1.13, we see that the induced map $\mathrm{fib}(f) \otimes_A \mathrm{fib}(f) \simeq \mathrm{fib}(\beta) \to \mathrm{fib}(f)$ coincides with α. □

Remark 7.4.1.16. Let $f : A \to B$ be as in Proposition 7.4.1.14. It follows that the composite map

$$\mathrm{fib}(f) \otimes_A \mathrm{fib}(f) \xrightarrow{\alpha} \mathrm{fib}(f) \xrightarrow{\beta} \mathrm{fib}(f'')$$

is canonically nullhomotopic. We can describe the nullhomotopy explicitly as follows. The factorization $f = f'' \circ f'$ determines a commmutative diagram

$$\begin{array}{ccc} \mathrm{fib}(f) \otimes_A \mathrm{fib}(f) & \xrightarrow{\alpha} & \mathrm{fib}(f) \\ \downarrow & & \downarrow \beta \\ \mathrm{fib}(f'') \otimes_{B^\eta} \mathrm{fib}(f'') & \xrightarrow{\alpha'} & \mathrm{fib}(f'') \end{array}$$

in ${}_A\mathrm{BMod}_A(\mathcal{C})$. Proposition 7.4.1.14 supplies a canonical nullhomotopy of α', whence a canonical nullhomotopy of $\beta \circ \alpha$.

Remark 7.4.1.17. Let $f : A \to B$ be as in Proposition 7.4.1.15. Using Proposition 7.4.1.15, we obtain a fiber sequence

$$\mathrm{fib}(f) \otimes_A \mathrm{fib}(f) \to A \to B^\eta.$$

We can summarize the situation informally as follows: the universal square-zero extension B^η of B through which f factors has the form $A/(I \otimes_A I)$, where $I = \mathrm{fib}(f)$.

We now introduce a special class of morphisms between $\mathbb{E}_1$-algebras, which we call *small extensions*.

Definition 7.4.1.18. Let $\mathcal{C}$ be a stable presentable ∞-category equipped with a monoidal structure and a t-structure. Assume that the unit object $\mathbf{1} \in \mathcal{C}$ belongs to $\mathcal{C}_{\geq 0}$, that the tensor product $\otimes : \mathcal{C} \times \mathcal{C} \to \mathcal{C}$ preserves small colimits separately in each variable, and that $\otimes$ carries $\mathcal{C}_{\geq 0} \times \mathcal{C}_{\geq 0}$ into $\mathcal{C}_{\geq 0}$.

Let $f : A \to B$ be a map of associative algebra objects of $\mathcal{C}$ and let $n \geq 0$. We will say that f is an *n-connective extension* if $A \in \mathcal{C}_{\geq 0}$ and $\mathrm{fib}(f) \in \mathcal{C}_{\geq n}$. We will say that f is an *n-small extension* if the following additional conditions are satisfied:

小红书
小红书号:3189205503 qq

(1) The fiber $\mathrm{fib}(f)$ belongs to $\mathcal{C}_{\leq 2n}$.

(2) The multiplication map $\mathrm{fib}(f) \otimes_A \mathrm{fib}(f) \to \mathrm{fib}(f)$ is nullhomotopic.

We let $\mathrm{Fun}_{n-con}(\Delta^1, \mathrm{Alg}(\mathcal{C}))$ denote the full subcategory of $\mathrm{Fun}(\Delta^1, \mathrm{Alg}(\mathcal{C}))$ spanned by the n-connective extensions, and $\mathrm{Fun}_{n-sm}(\Delta^1, \mathrm{Alg}(\mathcal{C}))$ the full subcategory of $\mathrm{Fun}_{n-con}(\Delta^1, \mathrm{Alg}(\mathcal{C}))$ spanned by the n-small extensions.

Remark 7.4.1.19. Let $\mathcal{C}$ be as in Definition 7.4.1.18 and let $f : A \to B$ be an n-connective extension for $n \geq 0$. Since A and $\mathrm{fib}(f)$ belong to $\mathcal{C}_{\geq 0}$, we deduce that $B \in \mathcal{C}_{\geq 0}$. Moreover, the map $\pi_0 A \to \pi_0 B$ is an epimorphism in the abelian category $\mathcal{C}^{\heartsuit}$.

Remark 7.4.1.20. Let $\mathcal{C}$ be as in Definition 7.4.1.18, and let $f : A \to B$ be an n-connective extension such that $\mathrm{fib}(f) \in \mathcal{C}_{\leq 2n}$. Since $\mathrm{fib}(f) \otimes_A \mathrm{fib}(f) \in \mathcal{C}_{\geq 2n}$, the multiplication map $\mathrm{fib}(f) \otimes_A \mathrm{fib}(f) \to \mathrm{fib}(f)$ is nullhomotopic if and only if it induces the zero map $\pi_{2n}(\mathrm{fib}(f) \otimes_A \mathrm{fib}(f)) \to \pi_{2n} \mathrm{fib}(f)$ in the abelian category $\mathcal{C}^{\heartsuit}$. In other words, condition (2) of Definition 7.4.1.18 is equivalent to the vanishing of a certain map

$$\pi_n \mathrm{fib}(f) \otimes \pi_n \mathrm{fib}(f) \to \pi_{2n} \mathrm{fib}(f)$$

in $\mathcal{C}^{\heartsuit}$.

Example 7.4.1.21. Let $\mathcal{C} = \mathrm{Sp}$ be the ∞-category of spectra, and let A be an associative ring, which we regard as a discrete algebra object of $\mathcal{C}$. A map $f : \widetilde{A} \to A$ in $\mathrm{Alg}(\mathcal{C})$ is a 0-small extension if and only if the following conditions are satisfied:

(a) The algebra object $\widetilde{A} \in \mathrm{Alg}(\mathcal{C})$ is discrete.

(b) The map f induces a surjection of associative rings $\pi_0 \widetilde{A} \to \pi_0 A$.

(c) If $I \subseteq \pi_0 \widetilde{A}$ is the kernel of the ring homomorphism of (b), then $I^2 = 0 \subseteq \pi_0 \widetilde{A}$.

In other words, the theory of 0-small extensions of discrete associative algebras in $\mathcal{C}$ is equivalent to the classical theory of square-zero extensions between ordinary associative rings.

Notation 7.4.1.22. Let $\mathcal{C}$ be as in Definition 7.4.1.18. We let $\mathcal{D}\mathrm{er}$ denote the ∞-category $\mathcal{D}\mathrm{er}(\mathrm{Alg}(\mathcal{C}))$ of derivations in $\mathrm{Alg}(\mathcal{C})$. Using Theorem 7.3.4.13, we can identify objects of $\mathcal{D}\mathrm{er}$ with pairs $(A, \eta : L_A \to M[1])$ where A is an algebra object of $\mathcal{C}$ and η is a map of A-A-bimodules. We let $\mathcal{D}\mathrm{er}_{n-con}$ denote the full subcategory of $\mathcal{D}\mathrm{er}$ spanned by those pairs $(A, \eta : L_A \to M[1])$ such $A \in \mathcal{C}_{\geq 0}$ and $M \in \mathcal{C}_{\geq n}$. We let $\mathcal{D}\mathrm{er}_{n-sm}$ denote the full subcategory of $\mathcal{D}\mathrm{er}_{n-con}$ spanned by those pairs $(A, \eta : L_A \to M[1])$ such that $M \in \mathcal{C}_{\leq 2n}$.

We can now state a preliminary version of our main result:

小红书
小红书号:3189205503 qq

Theorem 7.4.1.23. *Let $\mathcal{C}$ be as in Definition 7.4.1.18, and let $\Phi : \mathcal{D}\mathrm{er} \to \mathrm{Fun}(\Delta^1, \mathrm{Alg}(\mathcal{C}))$ be the functor of Notation 7.4.1.5, given informally by the formula*

$$(A, \eta : L_A \to M[1]) \mapsto (A^{\eta} \to A).$$

For each $n \geq 0$, the functor Φ induces an equivalence of ∞-categories

$$\Phi_{n-sm} : \mathcal{D}\mathrm{er}_{n-sm} \to \mathrm{Fun}_{n-sm}(\Delta^1, \mathrm{Alg}(\mathcal{C})).$$

Proof. Let $A \in \mathrm{Alg}(\mathcal{C})$ and let $M \in {}_A\mathrm{BMod}_A(\mathcal{C})$. For any derivation $\eta : L_A \to M[1]$, we can identify the fiber of square-zero extension $A^{\eta} \to A$ with M (as an object of $\mathcal{C}$). It follows immediately that the functor $\Phi : \mathcal{D}\mathrm{er} \to \mathrm{Fun}(\Delta^1, \mathrm{Alg}(\mathcal{C}))$ restricts to a functor $\Phi_{n-con} : \mathcal{D}\mathrm{er}_{n-con} \to \mathrm{Fun}_{n-con}(\Delta^1, \mathrm{Alg}(\mathcal{C}))$. For any square-zero extension $f : A^{\eta} \to A$, the induced multiplication $\mathrm{fib}(f) \otimes_{A^{\eta}} \mathrm{fib}(f) \to \mathrm{fib}(f)$ is nullhomotopic (Proposition 7.4.1.14), so that Φ also restricts to a functor $\Phi_{n-sm} : \mathcal{D}\mathrm{er}_{n-sm} \to \mathrm{Fun}_{n-sm}(\Delta^1, \mathrm{Alg}(\mathcal{C}))$.

The functor Φ admits a left adjoint $\Psi : \mathrm{Fun}(\Delta^1, \mathrm{Alg}(\mathcal{C})) \to \mathcal{D}\mathrm{er}$, given informally by the formula

$$(\widetilde{A} \to A) \mapsto (A, \eta : L_A \to L_{A/\widetilde{A}}).$$

Assume that $f : \widetilde{A} \to A$ is an n-connective extension. Remark 7.4.1.12 implies that $L_{A/\widetilde{A}}$ can be identified with the fiber of the multiplication map $m : A \otimes_{\widetilde{A}} A \to A$, and therefore with the cofiber of the section

$$s : A \simeq A \otimes_{\widetilde{A}} \widetilde{A} \to A \otimes_{\widetilde{A}} A$$

of m. Thus $L_{A/\widetilde{A}}[-1] \simeq \mathrm{fib}(f) \otimes_{\widetilde{A}} A$. Since $\mathrm{fib}(f)$ is n-connective and A and $\widetilde{A}$ are connective, we deduce that $L_{A/\widetilde{A}}$ is n-connective. It follows that Ψ restricts to a functor $\Psi_{n-con} : \mathrm{Fun}_{n-con}(\Delta^1, \mathrm{Alg}(\mathcal{C})) \to \mathcal{D}\mathrm{er}_{n-con}$.

Let $i : \mathcal{D}\mathrm{er}_{n-sm} \hookrightarrow \mathcal{D}\mathrm{er}_{n-con}$ be the inclusion functor. Then i admits a left adjoint τ, given informally by the formula

$$\tau(A, L_A \to M[1]) = (A, L_A \to (\tau_{\leq 2n} M)[1]).$$

It follows that Φ_{n-sm} also admits a left adjoint Ψ_{n-sm}, given by the composition $\tau \circ \Psi_{n-con}$. The functor Φ_{n-sm} is clearly conservative. To prove that Φ_{n-sm} is an equivalence of ∞-categories, it will suffice to show that the unit transformation $u : \mathrm{id} \to \Phi_{n-sm} \circ \Psi_{n-sm}$ is an equivalence. In other words, we must show that if $f : \widetilde{A} \to A$ is an n-small extension, then the transformation $u_f : f \to (\Phi \circ \tau \circ \Psi)(f)$ is an equivalence. Let $\eta_0 : L_{A/\widetilde{A}} \to LA/\widetilde{A}$ be the identity map, and let η be the truncation map $L_{A/\widetilde{A}} \to \tau_{\leq 2n+1} L_{A/\widetilde{A}}$. We wish to show that the composite map $\widetilde{A} \to A^{\eta_0} \to A^{\eta}$ is an equivalence. We have a commutative diagram

$$\begin{array}{ccccc} \widetilde{A} & \xrightarrow{g} & A^{\eta_0} & \longrightarrow & A^{\eta} \\ \downarrow{\scriptstyle f} & & \downarrow{\scriptstyle f'} & & \downarrow{\scriptstyle f''} \\ A & \longrightarrow & A & \longrightarrow & A. \end{array}$$

小红书 小红书号:3189205503 qq

By construction, we have $\mathrm{fib}(f'') \simeq \tau_{\leq 2n} \mathrm{fib}(f')$. It will therefore suffice to show that g induces an equivalence $\mathrm{fib}(f) \simeq \tau_{\leq 2n} \mathrm{fib}(f')$. We have a fiber sequence

$$\mathrm{fib}(g) \xrightarrow{\alpha} \mathrm{fib}(f) \xrightarrow{\beta} \mathrm{fib}(f').$$

Proposition 7.4.1.15 allows us to identify α with the multiplication map $m : \mathrm{fib}(f) \otimes_{\widetilde{A}} \mathrm{fib}(f) \to \mathrm{fib}(f)$. Since f is a small extension, m is nullhomotopic, so that β induces an equivalence $\mathrm{fib}(f') \simeq \mathrm{fib}(f) \oplus (\mathrm{fib}(f) \otimes_{\widetilde{A}} \mathrm{fib}(f))[1]$. Since $\mathrm{fib}(f) \in \mathcal{C}_{\leq 2n} \cap \mathcal{C}_{\geq n}$, $(\mathrm{fib}(f) \otimes_{\widetilde{A}} \mathrm{fib}(f))[1] \in \mathcal{C}_{\geq 2n+1}$, so that the composite map $\mathrm{fib}(f) \to \mathrm{fib}(f') \to \tau_{\leq 2n} \mathrm{fib}(f')$ is an equivalence as desired. □

Remark 7.4.1.24. In the situation of Theorem 7.4.1.23, the full subcategory $\mathrm{Fun}_{n-sm}(\Delta^1, \mathrm{Alg}(\mathcal{C}))$ is a localization of $\mathrm{Fun}_{n-con}(\Delta^1, \mathrm{Alg}(\mathcal{C}))$. Indeed, we claim that the functor $\Phi_{n-sm} \circ \tau \circ \Psi^{n-con}$ is a left adjoint to the inclusion $\mathrm{Fun}_{n-sm}(\Delta^1, \mathrm{Alg}(\mathcal{C})) \hookrightarrow \mathrm{Fun}_{n-con}(\Delta^1, \mathrm{Alg}(\mathcal{C}))$. Using Theorem 7.4.1.23, we are reduced to proving that $\tau \circ \Psi_{n-con} : \mathrm{Fun}^{n-con}(\Delta^1, \mathrm{Alg}(\mathcal{C})) \to \mathcal{D}\mathrm{er}^{n-sm}$ is left adjoint to composition

$$\mathcal{D}\mathrm{er}_{n-sm} \hookrightarrow \mathcal{D}\mathrm{er}_{n-con} \xrightarrow{\Phi} \mathrm{Fun}_{n-con}(\Delta^1, \mathrm{Alg}(\mathcal{C})),$$

which is evident.

We now generalize the above discussion to the case of $\mathbb{E}_k$-algebras, for $k \geq 1$.

Notation 7.4.1.25. Let $1 \leq k \leq \infty$ and let $\mathcal{C}$ be presentable stable ∞-category equipped with a t-structure. Assume also that $\mathcal{C}$ is an $\mathbb{E}_k$-monoidal ∞-category, the unit object $\mathbf{1}$ belongs to $\mathcal{C}_{\geq 0}$, and that the tensor product $\otimes : \mathcal{C} \times \mathcal{C} \to \mathcal{C}$ preserves small colimits separately in each variable and carries $\mathcal{C}_{\geq 0} \times \mathcal{C}_{\geq 0}$ into $\mathcal{C}_{\geq 0}$.

We let $\mathrm{Alg}^{(k)}(\mathcal{C})$ denote the ∞-category $\mathrm{Alg}_{/\mathbb{E}_k}(\mathcal{C})$ and $\mathrm{Alg}(\mathcal{C})$ the ∞-category $\mathrm{Alg}_{\mathbb{E}_1/\mathbb{E}_k}(\mathcal{C})$, so that the inclusion $\mathbb{E}_1 \hookrightarrow \mathbb{E}_k$ determines a forgetful functor $\theta : \mathrm{Alg}^{(k)}(\mathcal{C}) \to \mathrm{Alg}(\mathcal{C})$. For $n \geq 0$, we say that a morphism $f : A \to B$ in $\mathrm{Alg}^{(k)}(\mathcal{C})$ is an *n-small extension* if $\theta(f)$ is an n-small extension. We let $\mathrm{Fun}_{n-sm}(\Delta^1, \mathrm{Alg}^{(k)}(\mathcal{C}))$ denote the full subcategory of $\mathrm{Fun}(\Delta^1, \mathrm{Alg}^{(k)}(\mathcal{C}))$ spanned by the n-small extensions.

For $A \in \mathrm{Alg}^{(k)}(\mathcal{C})$, we let $L_A^{(k)} \in \mathrm{Sp}(\mathrm{Alg}^{(k)}(\mathcal{C})_{/A}) \simeq \mathrm{Mod}_A^{\mathbb{E}_k}(\mathcal{C})$ denote its cotangent complex as an object of $\mathrm{Alg}^{(k)}(\mathcal{C})$. Let $\mathcal{D}\mathrm{er}^{(k)}$ denote the ∞-category $\mathcal{D}\mathrm{er}(\mathrm{Alg}^{(k)}(\mathcal{C}))$ of derivations in $\mathrm{Alg}^{(k)}(\mathcal{C})$, so that the objects of $\mathcal{D}\mathrm{er}^{(k)}$ can be identified with pairs $(A, \eta : L_A^{(k)} \to M[1])$ where A is an $\mathbb{E}_k$-algebra object of $\mathcal{C}$ and η is a morphism in $\mathrm{Mod}_A^{\mathbb{E}_k}(\mathcal{C})$. We let $\mathcal{D}\mathrm{er}_{n-sm}^{(k)}$ denote the full subcategory of $\mathcal{D}\mathrm{er}^{(k)}$ spanned by those pairs $(A, \eta : L_A^{(k)} \to M[1])$ such that A is connective and the image of M belongs to $\mathcal{C}_{\geq n} \cap \mathcal{C}_{\leq 2n}$.

We have the following generalization of Theorem 7.4.1.23:

小红书
小红书号:3189205503 qq

Theorem 7.4.1.26. *Let $\mathcal{C}$ be as in Notation 7.4.1.25 and let $\Phi^{(k)} : \mathcal{D}\mathrm{er}^{(k)} \to \mathrm{Fun}(\Delta^1, \mathrm{Alg}^{(k)}(\mathcal{C}))$ be the functor of Notation 7.4.1.5 for $1 \leq k \leq \infty$. For each $n \geq 0$, the functor $\Phi^{(k)}$ induces an equivalence of ∞-categories*

$$\Phi^{(k)}_{n-sm} : \mathcal{D}\mathrm{er}^{(k)}_{n-sm} \to \mathrm{Fun}_{n-sm}(\Delta^1, \mathrm{Alg}^{(k)}(\mathcal{C})).$$

Corollary 7.4.1.27. *Let $\mathcal{C}$ be as in Notation 7.4.1.25. Then every n-small extension in $\mathrm{Alg}^{(k)}(\mathcal{C})$ is a square-zero extension.*

Corollary 7.4.1.28. *Let $\mathcal{C}$ be as in Notation 7.4.1.25, and let $A \in \mathrm{Alg}^{(k)}(\mathcal{C}_{\geq 0})$. Then every map in the Postnikov tower*

$$\ldots \to \tau_{\leq 3}A \to \tau_{\leq 2}A \to \tau_{\leq 1}A \to \tau_{\leq 0}A$$

is a square-zero extension.

Remark 7.4.1.29. Corollary 7.4.1.28 underscores the importance of the cotangent complex in the study of algebraic structures. For example, suppose we wish to understand the space of maps $\mathrm{Map}_{\mathrm{Alg}^{(k)}}(A, B)$ between two connective $\mathbb{E}_k$-rings A and B. This space can be realized as the homotopy inverse limit of the mapping spaces $\mathrm{Map}_{\mathrm{Alg}^{(k)}}(A, \tau_{\leq n}B)$. In the case $n = 0$, this is simply the discrete set of ring homomorphisms from $\pi_0 A$ to $\pi_0 B$. For $n > 0$, Corollary 7.4.1.28 implies the existence of a pullback diagram

$$\begin{array}{ccc} \tau_{\leq n}B & \longrightarrow & \tau_{\leq n-1}B \\ \downarrow & & \downarrow \\ \tau_{\leq n-1}B & \longrightarrow & \tau_{\leq n-1}B \oplus (\pi_n B)[n+1]. \end{array}$$

This reduces us to the study of $\mathrm{Map}_{\mathrm{Alg}^{(k)}}(A, \tau_{\leq n-1}B)$ and the "linear" problem of understanding derivations from A into $(\pi_n B)[n+1]$. This linear problem is controlled by the cotangent complex $L^{(k)}_A$.

Lemma 7.4.1.30. *Let $\mathcal{C}$ be a stable monoidal ∞-category equipped with a t-structure. Assume that the tensor product $\otimes : \mathcal{C} \times \mathcal{C} \to \mathcal{C}$ is exact in each variable and carries $\mathcal{C}_{\geq 0} \times \mathcal{C}_{\geq 0}$ into $\mathcal{C}_{\geq 0}$. Let $n \geq 0$, and suppose we are given a finite collection of morphisms $\{p_i : B_i \to A_i\}_{1 \leq i \leq m}$ in $\mathcal{C}$ such that each $A_i \in \mathcal{C}_{\geq 0}$ and each $\mathrm{fib}(p_i)$ is $(n+1)$-connective. Let f denote the induced map*

$$\mathrm{fib}(\bigotimes_i p_i) \to \prod_{1 \leq j \leq m} \mathrm{fib}(\mathrm{id}_{A_1} \otimes \cdots \otimes \mathrm{id}_{A_{j-1}} \otimes p_j \otimes \mathrm{id}_{A_{j+1}} \otimes \cdots \otimes \mathrm{id}_{A_m}).$$

Then $\mathrm{fib}(f) \in \mathcal{C}_{\geq 2n+2}$.

Proof. We proceed by induction on n. When $n = 0$, $\mathrm{fib}(f) \simeq 0$ and the result is obvious. Assume therefore that $n > 0$. Let $p = \bigotimes_{1 \leq i \leq m} p_i$ and let $p' = \bigotimes_{1 < i \leq n} p_i$. We have a transformation of

小红书 小红书号:3189205503 qq

fiber sequences

$$\begin{array}{ccc} B_1 \otimes \mathrm{fib}(p') & \xrightarrow{g} & \prod_{1<j\leq m} \mathrm{fib}(\mathrm{id}_{A_1} \otimes \cdots \otimes p_j \otimes \cdots \otimes \mathrm{id}_{A_m}) \\ \downarrow & & \downarrow \\ \mathrm{fib}(p) & \xrightarrow{f} & \prod_{1\leq j\leq m} \mathrm{fib}(\mathrm{id}_{A_1} \otimes \cdots \otimes p_j \otimes \cdots \otimes \mathrm{id}_{A_m}) \\ \downarrow & & \downarrow \\ \mathrm{fib}(p_1) \otimes A_2 \otimes \cdots \otimes A_n & \longrightarrow & \mathrm{fib}(p_1 \otimes \mathrm{id}_{A_2} \otimes \cdots \otimes \mathrm{id}_{A_m}). \end{array}$$

Since the tensor product on $\mathcal{C}$ is exact in each variable, the bottom horizontal map is an equivalence, so that $\mathrm{fib}(f) \simeq \mathrm{fib}(g)$. The map g factors as a composition

$$B_1 \otimes \mathrm{fib}(p') \xrightarrow{\mathrm{id}_{B_1} \otimes f'} \prod_{1<j\leq m} B_1 \otimes A_2 \otimes \cdots \otimes \mathrm{fib}(p_j) \otimes \cdots \otimes A_m \xrightarrow{g'} \prod_{1<j\leq m} A_1 \otimes A_2 \otimes \cdots \otimes \mathrm{fib}(p_j) \otimes \cdots \otimes A_m.$$

The inductive hypothesis implies that $\mathrm{fib}(f') \in \mathcal{C}_{\geq 2n+2}$. Since $A_1 \in \mathcal{C}_{\geq 0}$ and $\mathrm{fib}(p_1) \in \mathcal{C}_{\geq n+1}$, the object B_1 belongs to $\mathcal{C}_{\geq 0}$, so that $B_1 \otimes \mathrm{fib}(f') \in \mathcal{C}_{\geq 2n+2}$. We are therefore reduced to proving that $\mathrm{fib}(g') \in \mathcal{C}_{\geq 2n+2}$. The map g' factors as a product of maps g'_j with $\mathrm{fib}(g'_j) \simeq \mathrm{fib}(p_1) \otimes A_2 \otimes \cdots \otimes \mathrm{fib}(p_j) \otimes \cdots \otimes A_m$. Since each A_i belongs to $\mathcal{C}_{\geq 0}$ and $\mathrm{fib}(p_1), \mathrm{fib}(p_j) \in \mathcal{C}_{\geq n+1}$, we conclude that $\mathrm{fib}(g'_j) \in \mathcal{C}_{\geq 2n+2}$. It follows that $\mathrm{fib}(g') \simeq \prod_{1<j\leq m} \mathrm{fib}(g'_j) \in \mathcal{C}_{\geq 2n+2}$ as desired. □

Proof of Theorem 7.4.1.26. When $k = 1$, the desired result follows immediately from Theorem 7.4.1.23 (since the ∞-operads $\mathbb{E}_1^{\otimes}$ and $\mathrm{Assoc}^{\otimes}$ are equivalent; see Example 5.1.0.7). We will reduce the general case to the case $k = 1$ using Theorem 5.1.2.2. We will assume for notational simplicity that $k \geq 2$ is finite (the case $k = \infty$ can be treated by the same method, or by passage to the limit over finite k). Using the bifunctor of ∞-operads $\mathbb{E}_{k-1}^{\otimes} \times \mathbb{E}_1^{\otimes} \to \mathbb{E}_k^{\otimes}$ of Construction 5.1.2.1, we regard $\mathrm{Alg}(\mathcal{C})$ as an $\mathbb{E}_{k-1}$-monoidal ∞-category. Note that the tensor product on $\mathrm{Alg}(\mathcal{C})$ preserves small sifted colimits, and in particular filtered colimits. According to Example 7.3.1.15, the tangent bundle $T_{\mathrm{Alg}(\mathcal{C})}$ inherits an $\mathbb{E}_{k-1}$-monoidal structure, which induces in turn an $\mathbb{E}_{k-1}$-monoidal structure on $\mathcal{D}\mathrm{er}^{(1)}$. The tensor product on $\mathcal{D}\mathrm{er}^{(1)}$ is given informally by the formula

$$(A, \eta : L_A \to M[1]) \otimes (A', \eta' : L_{A'} \to M'[1]) \simeq (A \otimes A', \eta : L_{A \otimes A'} \to (A \otimes M')[1] \oplus (M \otimes A')[1]);$$

here we can think of η as the differential on $A \otimes A'$ determined by the Leibniz rule. We regard $\mathrm{Fun}(\Delta^1, \mathrm{Alg}(\mathcal{C}))$ as endowed with the $\mathbb{E}_{k-1}$-monoidal structure given by pointwise tensor product (see Remark 2.1.3.4), so that the functor $\Phi^{(1)} : \mathcal{D}\mathrm{er}^{(1)} \to \mathrm{Fun}(\Delta^1, \mathrm{Alg}(\mathcal{C}))$ is lax $\mathbb{E}_{k-1}$-monoidal. Let $(\mathcal{D}\mathrm{er}^{(1)}_{n-sm})^{\otimes} \subseteq (\mathcal{D}\mathrm{er}^{(1)})^{\otimes}$ be the ∞-suboperad of $\mathcal{D}\mathrm{er}^{\otimes}$ determined by the full subcategory $\mathcal{D}\mathrm{er}_{n-sm} \subseteq \mathcal{D}\mathrm{er}$ (as explained in §2.2.1). Define $\mathrm{Fun}_{n-sm}(\Delta^1, \mathrm{Alg}(\mathcal{C}))^{\otimes}$ similarly, so that $\Phi^{(1)}_{n-sm}$ induces a map of ∞-operads

$$\Phi' : (\mathcal{D}\mathrm{er}^{(1)}_{n-sm})^{\otimes} \to \mathrm{Fun}_{n-sm}(\Delta^1, \mathrm{Alg}(\mathcal{C}))^{\otimes}.$$

小红书
小红书号:3189205503 qq

We have a commutative diagram

$$\begin{array}{ccc} \mathcal{D}\mathrm{er}^{(k)}_{n-sm} & \xrightarrow{\Phi^{(k)}_{n-sm}} & \mathrm{Fun}_{n-sm}(\Delta^1, \mathrm{Alg}^{(k)}(\mathcal{C})) \\ \downarrow & & \downarrow \\ \mathrm{Alg}_{/\mathbb{E}_{k-1}}(\mathcal{D}\mathrm{er}^{(1)}_{n-sm}) & \longrightarrow & \mathrm{Alg}_{/\mathbb{E}_{k-1}}(\mathrm{Fun}_{n-sm}(\Delta^1, \mathrm{Alg}(\mathcal{C}))). \end{array}$$

Using Theorem 5.1.2.2, we deduce that the vertical maps are equivalences of ∞-categories. The lower horizontal map is given by composition with Φ'; it will therefore suffice to show that Φ' is an equivalence of ∞-operads.

Theorem 7.4.1.26 guarantees that Φ' induces an equivalence of underlying ∞-categories

$$\Phi_{n-sm} : \mathcal{D}\mathrm{er}^{(1)}_{n-sm} \to \mathrm{Fun}_{n-sm}(\Delta^1, \mathrm{Alg}(\mathcal{C})).$$

In particular, Φ_{n-sm} is essentially surjective. It will therefore suffice to show that Φ' is fully faithful. Unwinding the definitions, we must show that for every sequence of objects $\{(A_i, \eta_i : L_{A_i} \to M_i) \in \mathcal{D}\mathrm{er}^{(1)}_{n-sm}\}_{1 \leq i \leq m}$ and every object $(B, \eta' : L_B \to N) \in \mathcal{D}\mathrm{er}^{(1)}_{n-sm}$, if $f_i : A_i^{\eta_i} \to A_i$ and $g : B^{\eta'} \to B$ denote their images under $\Phi^{(1)}$, then $\Phi^{(1)}$ induces a homotopy equivalence

$$\theta : \mathrm{Map}_{\mathcal{D}\mathrm{er}^{(1)}}(\bigotimes_{1 \leq i \leq m} (A_i, \eta_i), (B, \eta)) \to \mathrm{Hom}_{\mathrm{Fun}(\Delta^1, \mathrm{Alg}(\mathcal{C}))}(\bigotimes_{1 \leq i \leq n} f_i, g).$$

Let $\Psi^{(1)} : \mathrm{Fun}(\Delta^1, \mathrm{Alg}(\mathcal{C})) \to \mathcal{D}\mathrm{er}^{(1)}$ be the left adjoint to $\Phi^{(1)}$ and $\tau : \mathcal{D}\mathrm{er}_{n-con} \to \mathcal{D}\mathrm{er}_{n-sm}$ a left adjoint to the inclusion, as in Theorem 7.4.1.26. The codomain of θ is homotopy equivalent to the mapping space $\mathrm{Map}_{\mathcal{D}\mathrm{er}^{(1)}}(\Psi(\otimes_i f_i), (B, \eta'))$. Since η' is n-small, it will suffice to show that if $v : \Psi(\otimes_i f_i) \to \bigotimes_i (A_i, \eta_i)$ is the evident counit map, then $\tau(v)$ is an equivalence in $\mathcal{D}\mathrm{er}^{(1)}$. Let $A = \bigotimes_i A_i$ and $A' = \bigotimes_i A_i^{\eta_i}$, so we can identify v with a map of A-A-bimodules

$$v : L_{A/A'} \to \prod_i A_1 \otimes \cdots \otimes A_{i-1} \otimes M_i \otimes A_{i+1} \otimes \cdots \otimes A_m.$$

We wish to show that $\tau_{\leq 2n+1}(v)$ is an equivalence in $\mathcal{C}$.

Using Remark 7.4.1.12, we can identify $L_{A/A'}$ with the cofiber of $\otimes_{1 \leq i \leq n} p_i$, where each p_i is the multiplication map $A_i \otimes_{A_i^{\eta_i}} A_i \to A_i$. Unwinding the definitions, we see that v is is a product of maps $\{v_j\}_{1 \leq j \leq m}$, each of which is given by the composition

$$\begin{array}{rcl} \mathrm{fib}(\otimes_i p_i) & \xrightarrow{v'_j} & \mathrm{fib}(\mathrm{id}_{A_1} \otimes \cdots \otimes \mathrm{id}_{A_{j-1}} \otimes p_j \otimes \mathrm{id}_{A_{j+1}} \otimes \cdots \otimes \mathrm{id}_{A_m} \\ & \simeq & A_1 \otimes \cdots \otimes A_{j-1} \otimes \mathrm{fib}(p_j) \otimes A_{j+1} \otimes \cdots \otimes A_m \\ & \xrightarrow{v''_j} & A_1 \otimes \cdots A_{j-1} \otimes M_j \otimes A_{j+1} \otimes \cdots \otimes A_m. \end{array}$$

Here each v''_j is induced by the map $t_j : \mathrm{fib}(p_j) \simeq L_{A_j/A_j^{\eta_j}} \to M_j$ determined by the adjunction of $\Phi^{(1)}$ and $\Psi^{(1)}$. The proof of Theorem 7.4.1.26 shows that $\tau_{\leq 2n+1}(t_j)$ is an equivalence. Since each

小红书 小红书号:3189205503 qq

A_i is connective, it follows that $\tau_{\leq 2n+1}(v_j'')$ is an equivalence. To complete the proof, it will suffice to show that if

$$v' : \mathrm{fib}(\otimes_i p_i) \to \prod_{1 \leq j \leq m} A_1 \otimes \cdots \otimes A_{j-1} \otimes \mathrm{fib}(p_j) \otimes A_{j+1} \otimes \cdots \otimes A_m$$

is the product of the maps v_j', then $\tau_{\leq 2n+1}(v')$ is an equivalence in $\mathcal{C}$. This follows from Lemma 7.4.1.30, since $\mathrm{fib}(m_i)$ is $(n+1)$-connective for $1 \leq i \leq m$. □

7.4.2 Deformation Theory of $\mathbb{E}_\infty$-Algebras

Suppose we are given a map of commutative rings $\phi : \widetilde{A} \to A$. Let B be a flat commutative A-algebra. A *deformation of B over $\widetilde{A}$* is a pair $(\widetilde{B}, \alpha)$, where $\widetilde{B}$ is a flat commutative $\widetilde{A}$-algebra and α is an isomorphism of A-algebras $\widetilde{B} \otimes_{\widetilde{A}} A \simeq B$. One of the basic problems of *deformation theory* is to classify the deformations of B over $\widetilde{A}$. In the special case where $\widetilde{A}$ is a square-zero extension of A by an A-module $M \simeq \ker(\phi)$, this can be translated into a linear problem involving the cotangent complexes of B and A. In this section, we will explain this translation in a more general context. We begin by introducing some terminology.

Definition 7.4.2.1. Let A be an $\mathbb{E}_\infty$-ring and suppose we are given a square-zero extension $\widetilde{A}$ of A by an A-module M. If $B \in \mathrm{CAlg}_A$, then a *deformation of B to $\widetilde{A}$* is a pair $(\widetilde{B}, \alpha)$, where $\widetilde{B} \in \mathrm{CAlg}_{\widetilde{A}}$ and α is an equivalence $\widetilde{B} \otimes_{\widetilde{A}} A \simeq B$ in CAlg_A.

Remark 7.4.2.2. In Definition 7.4.2.1, it is not necessary to require that $\widetilde{B}$ be flat over $\widetilde{A}$. If A is connective and $\widetilde{A}$ is a square-zero extension of A by a connective A-module M, then a deformation $\widetilde{B}$ of B will be flat over $\widetilde{A}$ if and only if B is flat over A. The "only if" direction is obvious. For the converse, suppose that B is flat over A: we claim that for every discrete $\widetilde{A}$-module N, the relative tensor product $\widetilde{B} \otimes_{\widetilde{A}} N$ is discrete. To prove this, let $I \subseteq \pi_0 \widetilde{A}$ be the kernel of the surjective map $\pi_0 \widetilde{A} \to \pi_0 A$, so that we have a short exact sequence of modules over $\pi_0 \widetilde{A}$:

$$0 \to IN \to N \to N/IN \to 0$$

It will therefore suffice to show that the tensor products $\widetilde{B} \otimes_{\widetilde{A}} IN$ and $\widetilde{B} \otimes_{\widetilde{A}} N/IN$ are discrete. Replacing N by IN or N/IN, we can reduce to the case where $IN = 0$, so that N has the structure of an A-module. Then $\widetilde{B} \otimes_{\widetilde{A}} N \simeq B \otimes_A N$ is discrete by virtue of the assumption that B is flat over A.

In the situation of Definition 7.4.2.1, the assumption that $\widetilde{A}$ is a square-zero extension of A by M implies that $\widetilde{A} \simeq A^\eta$ for some A-linear map $\eta : L_A \to M[1]$. Given a map of $\mathbb{E}_\infty$-rings $A \to B$, we get a map of B-modules $\eta_B : B \otimes_A L_A \to B \otimes_A M[1]$. Our main result can be summarized informally as follows (see Proposition 7.4.2.5 below for a precise formulation):

小红书
小红书号:3189205503 qq

($*$) Assume that A, B, and M are connective. Then giving a deformation of $\widetilde{B}$ of B over $\widetilde{A}$ is equivalent to providing a factorization of η_B as a composition

$$B \otimes_A L_A \to L_B \xrightarrow{\eta'} B \otimes_A M[1].$$

In this case, the corresponding extension is given by $\widetilde{B} = B^{\eta'}$.

In particular, B admits a deformation over $\widetilde{A}$ if and only if the composite map

$$L_{B/A}[-1] \to B \otimes_A L_A \xrightarrow{\eta_B} B \otimes_A M[1]$$

vanishes.

Remark 7.4.2.3. More concretely, we see that a square-zero extension of A by an A-module M and a map of $\mathbb{E}_\infty$-rings $A \to B$ determine an *obstruction class* in $\mathrm{Ext}^2_B(L_{B/A}, B \otimes_A M)$, given by the composition $L_{B/A}[-1] \to B \otimes_A L_A \to B \otimes_A M[1]$. If A and M are connective, then this obstruction class vanishes if and only if B admits a deformation over $\widetilde{A}$. In this case, the collection of equivalence classes of extensions is a torsor for the abelian group $\mathrm{Ext}^1_B(L_{B/A}, B \otimes_A M)$.

This is a precise analogue of the situation in the classical deformation theory of algebraic varieties. Suppose given a smooth morphism of smooth, projective varieties $X \to Y$ over a field k. Given a first-order deformation $\widetilde{Y}$ of Y, we encounter an obstruction in $\mathrm{H}^2(X; T_{X/Y})$ to extending $\widetilde{Y}$ to a first-order deformation of X. If this obstruction vanishes, then the set of isomorphism classes of extensions is naturally a torsor for the cohomology group $\mathrm{H}^1(X; T_{X/Y})$ (see [89]).

In order to formulate assertion ($*$) more precisely, we need to introduce a bit of terminology.

Notation 7.4.2.4. Throughout this section, we let $\mathcal{D}\mathrm{er} = \mathcal{D}\mathrm{er}(\mathrm{CAlg})$ denote the ∞-category of derivations in CAlg (see Definition 7.4.1.1). More informally, the objects of $\mathcal{D}\mathrm{er}$ are triples (A, M, η), where A is an $\mathbb{E}_\infty$-ring, M is an A-module spectrum, and $\eta : A \to M[1]$ is a derivation. In what follows, we will generally abuse notation by identifying the triple (A, M, η) with the underlying map $\eta : A \to M[1]$. We let $A^\eta = \mathrm{fib}(\eta)$ denote the corresponding square-zero extension of A.

We define a subcategory $\mathcal{D}\mathrm{er}^+ \subseteq \mathcal{D}\mathrm{er}$ as follows:

(i) An object $(\eta : A \to M[1]) \in \mathcal{D}\mathrm{er}$ belongs to $\mathcal{D}\mathrm{er}^+$ if and only if both A and M are connective. Equivalently, η belongs to $\mathcal{D}\mathrm{er}^+$ if both A and A^η are connective, and the map of commutative rings $\pi_0 A^\eta \to \pi_0 A$ is surjective.

(ii) Let $f : (\eta : A \to M[1]) \to (\eta' : B \to N[1])$ be a morphism in $\mathcal{D}\mathrm{er}$ between objects which belong to $\mathcal{D}\mathrm{er}^+$. Then f belongs to $\mathcal{D}\mathrm{er}^+$ if and only if the induced map $B \otimes_A M \to N$ is an equivalence of B-modules.

We can now formulate ($*$) more precisely:

小红书
小红书号:3189205503 qq

Proposition 7.4.2.5. *Let A be a connective $\mathbb{E}_\infty$-ring, M a connective A-module, and $\eta : A \to M[1]$ a derivation. Then the functor Φ of Notation 7.4.1.5 induces an equivalence of ∞-categories*

$$\mathcal{D}\mathrm{er}^+_{\eta/} \to \mathrm{CAlg}^{\mathrm{cn}}_{A^\eta},$$

given on objects by $(\eta' : B \to N[1]) \mapsto B^{\eta'}$.

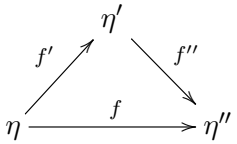
We will deduce Proposition 7.4.2.5 from a slightly stronger result, whose statement will require a bit more notation.

Notation 7.4.2.6. We define a subcategory $\mathrm{Fun}^+(\Delta^1, \mathrm{CAlg})$ as follows:

(*i*) An object $f : \widetilde{A} \to A$ of $\mathrm{Fun}(\Delta^1, \mathrm{CAlg})$ belongs to $\mathrm{Fun}^+(\Delta^1, \mathrm{CAlg})$ if and only if both A and $\widetilde{A}$ are connective, and f induces a surjection $\pi_0 \widetilde{A} \to \pi_0 A$.

(*ii*) Let $f, g \in \mathrm{Fun}^+(\Delta^1, \mathrm{CAlg})$, and let $\alpha : f \to g$ be a morphism in $\mathrm{Fun}(\Delta^1, \mathrm{CAlg})$. Then α belongs to $\mathrm{Fun}^+(\Delta^1, \mathrm{CAlg})$ if and only if it classifies a pushout square in the ∞-category CAlg.

Theorem 7.4.2.7. *Let $\Phi : \mathcal{D}\mathrm{er} \to \mathrm{Fun}(\Delta^1, \mathrm{CAlg})$ be the functor defined in Notation 7.4.1.5, given by $(\eta : A \to M[1]) \mapsto A^\eta$. Then Φ induces a functor $\Phi^+ : \mathcal{D}\mathrm{er}^+ \to \mathrm{Fun}^+(\Delta^1, \mathrm{CAlg})$. Moreover, the functor Φ^+ factors as a composition*



$$\mathcal{D}\mathrm{er}^+ \xrightarrow{\Phi^+_0} \overline{\mathcal{D}\mathrm{er}}^+ \xrightarrow{\Phi^+_1} \mathrm{Fun}^+(\Delta^1, \mathrm{CAlg}),$$

where Φ^+_0 is an equivalence of ∞-categories and Φ^+_1 is a left fibration.

Proof of Proposition 7.4.2.5. Let $\eta : A \to M[1]$ be an object of $\mathcal{D}\mathrm{er}^+$. Theorem 7.4.2.7 implies that Φ induces an equivalence $\mathcal{D}\mathrm{er}^+_{\eta/} \to \mathrm{Fun}^+(\Delta^1, \mathrm{CAlg})_{\Phi(\eta)/}$. It now suffices to observe that the evaluation map $\mathrm{Fun}^+(\Delta^1, \mathrm{CAlg})_{\Phi(\eta)/} \to \mathrm{CAlg}^{\mathrm{cn}}_{A^\eta}$ is a trivial Kan fibration. □

The proof of Theorem 7.4.2.7 will require a few lemmas.

Lemma 7.4.2.8. *Let*

be a commutative diagram in the ∞-category $\mathcal{D}\mathrm{er}$. If f and f' belong to $\mathcal{D}\mathrm{er}^+$, then so does f''.

Proof. This follows immediately from Proposition HTT.2.4.1.7 . □

Lemma 7.4.2.9. *Let $f : (\eta : A \to M[1]) \to (\eta' : B \to N[1])$ be a morphism in $\mathcal{D}\mathrm{er}^+$. If the induced map $A^\eta \to B^\eta$ is an equivalence of $\mathbb{E}_\infty$-rings, then f is an equivalence.*

小红书
小红书号:3189205503 qq

Proof. The morphism f determines a map of fiber sequences

$$\begin{array}{ccccc} A^{\eta} & \longrightarrow & A & \longrightarrow & M[1] \\ \downarrow & & \downarrow{\scriptstyle f_0} & & \downarrow{\scriptstyle f_1} \\ B^{\eta'} & \longrightarrow & B & \longrightarrow & N[1] \end{array}$$

Since the left vertical map is an equivalence, we obtain an equivalence $\alpha : \mathrm{cofib}(f_0) \simeq \mathrm{cofib}(f_1)$. To complete the proof, it will suffice to show that $\mathrm{cofib}(f_0)$ vanishes. Suppose otherwise. Since $\mathrm{cofib}(f_0)$ is connective, there exists some smallest integer n such that $\pi_n \mathrm{cofib}(f_0) \neq 0$. In particular, $\mathrm{cofib}(f_0)$ is n-connective.

Since f induces an equivalence $B \otimes_A M \to N$, the cofiber $\mathrm{cofib}(f_1)$ can be identified with $\mathrm{cofib}(f_0) \otimes_A M[1]$. Since M is connective, we deduce that $\mathrm{cofib}(f_1)$ is $(n+1)$-connective. Using the equivalence α, we conclude that $\mathrm{cofib}(f_0)$ is $(n+1)$-connective, which contradicts our assumption that $\pi_n \mathrm{cofib}(f_0) \neq 0$. □

Lemma 7.4.2.10. *Let $\mathcal{D}_0 \subseteq \mathcal{D}$ be small ∞-categories, and let $p : \mathcal{M} \to \mathcal{C}$ be a presentable fibration. Then:*

(1) *The induced map*

$$q : \mathrm{Fun}(\mathcal{D}, \mathcal{M}) \to \mathrm{Fun}(\mathcal{D}, \mathcal{C}) \times_{\mathrm{Fun}(\mathcal{D}_0, \mathcal{C})} \mathrm{Fun}(\mathcal{D}_0, \mathcal{M})$$

is a coCartesian fibration.

(2) *A morphism in $\mathrm{Fun}(\mathcal{D}, \mathcal{M})$ is q-coCartesian if and only if the induced functor $f : \mathcal{D} \times \Delta^1 \to \mathcal{M}$ is a p-left Kan extension of its restriction to $(\mathcal{D} \times \{0\}) \coprod_{\mathcal{D}_0 \times \{0\}} (\mathcal{D} \times \Delta^1)$.*

Proof. The "if" direction of (2) follows immediately from Lemma HTT.4.3.2.12 . Since every diagram

$$\begin{array}{ccc} (\mathcal{D} \times \{0\}) \coprod_{\mathcal{D}_0 \times \{0\}} (\mathcal{D} \times \Delta^1) & \longrightarrow & \mathcal{M} \\ \downarrow & \nearrow & \downarrow{\scriptstyle p} \\ \mathcal{D} \times \Delta^1 & \longrightarrow & \mathcal{C} \end{array}$$

admits an extension as indicated, which is a p-left Kan extension, assertion (1) follows immediately. The "only if" direction of (2) then follows from the uniqueness properties of q-coCartesian morphisms. □

Proof of Theorem 7.4.2.7. We let $\widetilde{\mathcal{D}\mathrm{er}}$ denote the ∞-category of extended derivations in CAlg (so that the forgetful functor $\widetilde{\mathcal{D}\mathrm{er}} \to \mathcal{D}\mathrm{er}$ is a trivial Kan fibration), and $\mathcal{M}^T$ a tangent correspondence

小红书 小红书号:3189205503 qq

for the ∞-category CAlg. Form a pullback diagram

$$\begin{array}{ccc} \widetilde{\mathcal{D}\mathrm{er}}^{+} & \longrightarrow & \widetilde{\mathcal{D}\mathrm{er}} \\ \downarrow{\scriptstyle u^{+}} & & \downarrow{\scriptstyle u} \\ \mathcal{D}\mathrm{er}^{+} & \longrightarrow & \mathcal{D}\mathrm{er}\,. \end{array}$$

Since the map u is a trivial Kan fibration, u^{+} is also a trivial Kan fibration.

Let $\mathcal{X}$ denote the full subcategory of $\mathrm{Fun}(\Delta^1 \times \Delta^1, \mathrm{CAlg})$ spanned by those diagrams

$$\begin{array}{ccc} \widetilde{A} & \longrightarrow & A \\ \downarrow & & \downarrow{\scriptstyle \alpha} \\ A' & \xrightarrow{\beta} & A''. \end{array}$$

such that α and β are equivalences. The diagonal inclusion $\Delta^1 \subseteq \Delta^1 \times \Delta^1$ induces a map $\epsilon : \mathcal{X} \to \mathrm{Fun}(\Delta^1, \mathrm{CAlg})$. Using Proposition HTT.4.3.2.15 , we deduce that this map is a trivial Kan fibration. The map ϵ has a section υ, which carries a morphism $\widetilde{A} \to A$ to the commutative diagram

$$\begin{array}{ccc} \widetilde{A} & \longrightarrow & A \\ \downarrow & & \downarrow{\scriptstyle \mathrm{id}} \\ A & \xrightarrow{\mathrm{id}} & A. \end{array}$$

It follows that υ is also an equivalence.

Let $\overline{\mathcal{D}\mathrm{er}}$ denote the full subcategory of $\mathrm{Fun}(\Delta^1 \times \Delta^1, \mathcal{M}^T)$ spanned by those pullback diagrams

$$\begin{array}{ccc} \widetilde{A} & \longrightarrow & A \\ \downarrow & & \downarrow{\scriptstyle \eta} \\ 0 & \xrightarrow{\gamma} & M \end{array}$$

such that the objects $\widetilde{A}$ and A belong to $\mathrm{CAlg} \subseteq \mathcal{M}^T$, the objects 0 and M belong to T_{CAlg}, the maps η and γ induce equivalences in CAlg, and 0 is a p-initial object of T_{CAlg}. We have a homotopy pullback diagram of ∞-categories

$$\begin{array}{ccc} \widetilde{\mathcal{D}\mathrm{er}} & \xrightarrow{\upsilon'} & \overline{\mathcal{D}\mathrm{er}} \\ \downarrow & & \downarrow \\ \mathrm{Fun}(\Delta^1, \mathrm{CAlg}) & \xrightarrow{\upsilon} & \mathcal{X}\,. \end{array}$$

Since υ is a categorical equivalence, we conclude that υ' is also a categorical equivalence.

小红书
小红书号:3189205503 qq

The functor Φ is defined to be a composition

$$\mathcal{D}\mathrm{er} \xrightarrow{s} \widetilde{\mathcal{D}\mathrm{er}} \xrightarrow{\upsilon'} \overline{\mathcal{D}\mathrm{er}} \xrightarrow{s'} \mathcal{X} \xrightarrow{s''} \mathrm{Fun}(\Delta^1, \mathrm{CAlg}),$$

where s is a section to u and s'' is the map which carries a diagram

$$\begin{array}{ccc} \widetilde{A} & \longrightarrow & A \\ \downarrow{\scriptstyle \alpha} & & \downarrow \\ A' & \longrightarrow & A'' \end{array}$$

to the map α. We define Φ_0^+ and Φ_1^+ to be the restrictions of $\upsilon' \circ s$ and $s'' \circ s'$, respectively. To complete the proof, it will suffice to show that s' induces a left fibration of simplicial sets $\overline{\mathcal{D}\mathrm{er}}^+ \to \mathrm{Fun}^+(\Delta^1, \mathrm{CAlg})$. To prove this, we will describe the ∞-category $\overline{\mathcal{D}\mathrm{er}}^+$ in another way.

Let $\overline{\mathcal{D}}$ denote the full subcategory of $\mathrm{Fun}(\Delta^1, \mathcal{M}^T)$ spanned by morphisms of the form $\eta_0 : \widetilde{A} \to 0$, satisfying the following conditions:

(i) The object $\widetilde{A}$ belongs to $\mathrm{CAlg} \subseteq \mathcal{M}^T$.

(ii) Let $f : \widetilde{A} \to A'$ be the image of η_0 under the map $\mathcal{M}^T \to \mathrm{CAlg}$. Then $\widetilde{A}$ and A' are connective, and f induces a surjection $\pi_0 \widetilde{A} \to \pi_0 A'$.

(iii) The object 0 belongs to $T_{\mathrm{CAlg}} \subseteq \mathcal{M}^T$. Moreover, 0 is a zero object of $T_{\mathrm{CAlg}} \times_{\mathrm{CAlg}} \{A'\} \simeq \mathrm{Mod}_{A'}$.

Using Proposition HTT.4.3.2.15 , we deduce that projection map $\psi_0 : \overline{\mathcal{D}} \to \mathrm{Fun}'(\Delta^1, \mathrm{CAlg})$ is a trivial Kan fibration, where $\mathrm{Fun}'(\Delta^1, \mathrm{CAlg})$ denotes the full subcategory of $\mathrm{Fun}(\Delta^1, \mathrm{CAlg})$ spanned by those morphisms $\widetilde{A} \to A$ which satisfy condition (ii).

Let $\mathcal{D}$ denote the full subcategory of $\mathrm{Fun}(\Delta^1 \times \Delta^1, \mathcal{M})$ spanned by those diagrams

$$\begin{array}{ccc} \widetilde{A} & \xrightarrow{e} & A \\ \downarrow{\scriptstyle \eta_0} & & \downarrow{\scriptstyle \eta} \\ 0 & \xrightarrow{\gamma} & M \end{array}$$

satisfying properties (i), (ii), and (iii) above, where $A \in \mathrm{CAlg} \subseteq \mathcal{M}^T$ and $M \in T_{\mathrm{CAlg}} \subseteq \mathcal{M}^T$. Restriction to the left half of the diagram yields a forgetful functor $\psi_1 : \mathcal{D} \to \overline{\mathcal{D}}$, which fits into a pullback square

$$\begin{array}{ccc} \mathcal{D} & \longrightarrow & \mathrm{Fun}(\Delta^1 \times \Delta^1, \mathcal{M}) \\ \downarrow{\scriptstyle \psi_1} & & \downarrow{\scriptstyle \psi_1'} \\ \overline{\mathcal{D}} & \longrightarrow & \mathrm{Fun}(\Delta^1, \mathcal{M}^T) \times_{\mathrm{Fun}(\Delta^1, \Delta^1)} \mathrm{Fun}(\Delta^1 \times \Delta^1, \Delta^1). \end{array}$$

小红书
小红书号:3189205503 qq

Applying Lemma 7.4.2.10 to the presentable fibration $\mathcal{M}^T \to \Delta^1$, we conclude that ψ_1' is a coCartesian fibration. It follows that ψ_1 is also a coCartesian fibration, and that a morphism in $\mathcal{D}$ is ψ_1-coCartesian if and only if it satisfies criterion (2) in the statement of Lemma 7.4.2.10.

We define subcategories $\mathcal{D}_0 \subseteq \mathcal{D}_1 \subseteq \mathcal{D}$ as follows:

- Every object of $\mathcal{D}$ belongs to $\mathcal{D}_1$.
- A morphism f in $\mathcal{D}$ belongs to $\mathcal{D}_1$ if and only if $(\psi_0 \circ \psi_1)(f)$ belongs to $\mathrm{Fun}^+(\Delta^1, \mathrm{CAlg})$, and f is ψ_1-coCartesian. Since ψ_0 is a trivial Kan fibration, this is equivalent to the requirement that f is $\psi_1 \circ \psi_0$-coCartesian.
- We define $\mathcal{D}_0$ to be the full subcategory of is the full subcategory of $\mathcal{D}_1$ spanned by those diagrams

$$\begin{array}{ccc} \widetilde{A} & \longrightarrow & A \\ \downarrow & & \downarrow{\scriptstyle \eta} \\ 0 & \xrightarrow{\gamma} & M \end{array}$$

  which are pullback diagrams in $\mathcal{M}^T$, such that η and γ induce equivalences in CAlg.

Using Corollary HTT.2.4.2.5 , we deduce immediately that $\psi_0 \circ \psi_1$ induces a left fibration $\psi : \mathcal{D}_1 \to \mathrm{Fun}^+(\Delta^1, \mathcal{C})$. To complete the proof, it will suffice to verify the following:

(1) The subcategory $\mathcal{D}_0 \subseteq \mathcal{D}_1$ is a *cosieve* in $\mathcal{D}_1$. That is, if $f : X \to Y$ is a morphism in $\mathcal{D}_1$ and X belongs to $\mathcal{D}_0$, then Y also belongs to $\mathcal{D}_0$. It follows immediately that ψ restricts to a left fibration $\mathcal{D}_0 \to \mathrm{Fun}^+(\Delta^1, \mathrm{CAlg})$.

(2) We have an equality $\mathcal{D}_0 = \overline{\mathcal{D}\mathrm{er}}^+$ of subcategories of $\overline{\mathcal{D}\mathrm{er}}$.

In order to prove these results, we will need to analyze the structure of a morphism $f : X \to Y$ in the ∞-category $\mathcal{D}$ in more detail. Let us suppose that $X, Y \in \mathcal{D}$ classify diagrams

$$\begin{array}{ccc} \widetilde{A} & \longrightarrow & A \\ \downarrow & & \downarrow \\ 0 & \longrightarrow & M \end{array} \qquad \begin{array}{ccc} \widetilde{B} & \longrightarrow & B \\ \downarrow & & \downarrow \\ 0' & \longrightarrow & N \end{array}$$

in $\mathcal{M}^T$, lying over diagrams

$$\begin{array}{ccc} \widetilde{A} & \longrightarrow & A \\ \downarrow & & \downarrow \\ A' & \longrightarrow & A'' \end{array} \qquad \begin{array}{ccc} \widetilde{B} & \longrightarrow & B \\ \downarrow & & \downarrow \\ B' & \longrightarrow & B'' \end{array}$$

in E_∞. Unwinding the definitions, we see that the morphism f belongs to $\mathcal{D}_1$ if and only if the following conditions are satisfied:

小红书
小红书号:3189205503 qq

(a) The morphism $\psi(f)$ belongs to $\mathrm{Fun}^{+}(\Delta^1, \mathrm{CAlg})$. In other words, the diagram

$$\begin{array}{ccc} \widetilde{A} & \longrightarrow & \widetilde{B} \\ \downarrow & & \downarrow \\ A' & \longrightarrow & B' \end{array}$$

is a pushout square of $\mathbb{E}_\infty$-rings.

(b) The diagram

$$\begin{array}{ccc} \widetilde{A} & \longrightarrow & \widetilde{B} \\ \downarrow & & \downarrow \\ A & \longrightarrow & B \end{array}$$

is a pushout square of $\mathbb{E}_\infty$-rings.

(c) The diagram

$$\begin{array}{ccc} 0 & \longrightarrow & M \\ \downarrow & & \downarrow{\scriptstyle j} \\ 0' & \longrightarrow & N \end{array}$$

is a pushout square in T_{CAlg}. Unwinding the definitions, this is equivalent to the requirement that the diagram

$$\begin{array}{ccc} A & \longrightarrow & B \\ \downarrow & & \downarrow \\ A'' & \longrightarrow & B'' \end{array}$$

is a pushout square of $\mathbb{E}_\infty$-rings, and that the induced map $M \otimes_{A''} B'' \to N$ is an equivalence of B''-modules.

We observe that (b) and (c) are simply a translation of the requirement that f satisfies criterion (2) of Lemma 7.4.2.10.

We now prove (1). Suppose that $X \in \mathcal{D}_0$; we wish to prove that $Y \in \mathcal{D}_0$. It follows from (c) that the map $B \to B''$ is an equivalence. To prove that the map $B' \to B''$ is an equivalence, we consider the commutative diagram

$$\begin{array}{ccccc} \widetilde{A} & \longrightarrow & A' & \longrightarrow & A'' \\ \downarrow & & \downarrow & & \downarrow \\ \widetilde{B} & \longrightarrow & B' & \longrightarrow & B''. \end{array}$$

From (a) we deduce that the left square is a pushout, and from (b) and (c) together we deduce that the large rectangle is a pushout. It follows that the right square is a pushout as well. Since

小红书
小红书号:3189205503 qq

the map $A' \to A''$ is an equivalence (in virtue of our assumption that $X \in \mathcal{D}_0$), we conclude that $B' \to B''$ is an equivalence as desired.

To complete the proof that $Y \in \mathcal{D}_0$, it will suffice to show that Y is a pullback diagram. This is equivalent to the assertion that the induced diagram Y':

$$\begin{array}{ccc} \widetilde{B} & \longrightarrow & B' \\ \downarrow & & \downarrow \\ B & \longrightarrow & B'' \oplus N \end{array}$$

is a pullback diagram of $\mathbb{E}_\infty$ $\widetilde{B}$-algebras. Since the forgetful functor $\mathrm{CAlg}(\mathrm{Mod}_{\widetilde{B}}) \to \mathrm{Mod}_{\widetilde{B}}$ preserves limits, it will suffice to show that Y' is a pullback diagram in the ∞-category of $\widetilde{B}$-modules.

Let X' denote the diagram

$$\begin{array}{ccc} \widetilde{A} & \longrightarrow & A' \\ \downarrow & & \downarrow \\ A & \longrightarrow & A'' \oplus M \end{array}$$

determined by X. Since $X \in \mathcal{D}_0$, X' is a pullback diagram of E_∞-rings, and therefore a pullback diagram of $\widetilde{A}$-modules. Since the relative tensor product functor $\otimes_{\widetilde{A}} \widetilde{B}$ is exact, it will suffice to show that the map $f : X \to Y$ induces an equivalence $X' \otimes_{\widetilde{A}} \widetilde{B} \to Y'$. In other words, it suffices to show that each of the induced diagrams

$$\begin{array}{ccc} \widetilde{A} & \longrightarrow & A \\ \downarrow & & \downarrow \\ \widetilde{B} & \longrightarrow & B \end{array} \qquad \begin{array}{ccc} \widetilde{A} & \longrightarrow & A' \\ \downarrow & & \downarrow \\ \widetilde{B} & \longrightarrow & B' \end{array} \qquad \begin{array}{ccc} \widetilde{A} & \longrightarrow & A'' \oplus M \\ \downarrow & & \downarrow \\ \widetilde{B} & \longrightarrow & B'' \oplus N \end{array}$$

is a pushout square of $\mathbb{E}_\infty$-rings. For the left and middle squares, this follows from (a) and (b). The rightmost square fits into a commutative diagram

$$\begin{array}{ccccc} \widetilde{A} & \longrightarrow & A & \longrightarrow & A'' \oplus M \\ \downarrow & & \downarrow & & \downarrow \\ \widetilde{B} & \longrightarrow & B & \longrightarrow & B'' \oplus N \end{array}$$

where the left part of the diagram is a pushout square by (b) and the right square is a pushout by (c). This completes the proof that $Y \in \mathcal{D}_0$, so that $\mathcal{D}_0 \subseteq \mathcal{D}_1$ is a cosieve as desired.

We now prove (2). We first show that the subcategories

$$\mathcal{D}_0, \overline{\mathcal{D}\mathrm{er}}^+ \subseteq \overline{\mathcal{D}\mathrm{er}}$$

小红书
小红书号:3189205503 qq

consist of the same objects. Let $X \in \overline{\mathcal{D}\mathrm{er}}$ be given by a diagram

$$\begin{array}{ccc} \widetilde{A} & \longrightarrow & A' \\ \downarrow & & \downarrow \\ 0 & \longrightarrow & M, \end{array}$$

projecting to a diagram

$$\begin{array}{ccc} \widetilde{A} & \longrightarrow & A' \\ \downarrow & & \downarrow \\ A & \longrightarrow & A'' \end{array}$$

in the ∞-category CAlg. Then X belongs to $\mathcal{D}_0$ if and only if the both A and $\widetilde{A}$ are connective, and the map $\pi_0 \widetilde{A} \to \pi_0 A$ is surjective. On the other hand, X belongs to $\widetilde{\mathcal{D}\mathrm{er}}^+$ if and only if both A' and $M[-1]$ are connective. The equivalence of these conditions follows immediately from the observation that A and A' are equivalent, and the long exact sequence of homotopy groups associated to the fiber sequence

$$\widetilde{A} \to A \to M.$$

Now let us suppose that $f : X \to Y$ is a morphism in $\overline{\mathcal{D}\mathrm{er}}$, where both X and Y belong to $\mathcal{D}_0$. We wish to show that f belongs to $\mathcal{D}_0$ if and only if f belongs to $\overline{\mathcal{D}\mathrm{er}}^+$. We observe that f belongs to $\mathcal{D}_0$ if and only if f satisfies the conditions (a), (b), and (c) described above. On the other hand, f belongs to $\overline{\mathcal{D}\mathrm{er}}^+$ if and only if the induced map $M \otimes_{A''} B'' \to N$ is an equivalence. Since this follows immediately from condition (c), we conclude that we have inclusions

$$\mathcal{D}_0 \subseteq \widetilde{\mathcal{D}\mathrm{er}}^+ \subseteq \widetilde{\mathcal{D}\mathrm{er}}.$$

To prove the reverse inclusion, let $f : X \to Y$ be a morphism in $\overline{\mathcal{D}\mathrm{er}}^+$. We wish to show that f belongs to $\mathcal{D}_0$. In other words, we must show that f satisfies conditions (a), (b), and (c). Since the maps

$$A \to A'' \leftarrow A' \qquad B \to B'' \leftarrow B'$$

are equivalences, condition (c) is automatic and conditions (a) and (b) are equivalent to one another. We are therefore reduced to the problem of showing that the diagram

$$\begin{array}{ccc} \widetilde{A} & \longrightarrow & \widetilde{B} \\ \downarrow & & \downarrow \\ A & \longrightarrow & B \end{array}$$

is a pushout square.

小红书
小红书号:3189205503 qq

The image $\Phi(f)$ can be factored as a composition $g' \circ g''$, corresponding to a diagram

$$\begin{array}{ccccc} \widetilde{A} & \longrightarrow & \widetilde{B} & \xrightarrow{\mathrm{id}} & \widetilde{B} \\ \downarrow & & \downarrow & & \downarrow \\ A & \longrightarrow & C & \longrightarrow & B, \end{array}$$

where the left square is a pushout. Let $f' : X \to Z$ be a ψ-coCartesian lift of g', so that f is homotopic to some composition $X \xrightarrow{f'} Z \xrightarrow{f''} Y$. We observe that f' belongs to $\mathcal{D}_0$. It will therefore suffice to show that f'' belongs to $\mathcal{D}_0$ as well. Lemma 7.4.2.8 implies that f'' belongs to $\overline{\mathcal{D}\mathrm{er}}^{+}$. We may therefore replace f by f'' and thereby reduce to the situation where f induces an equivalence $\widetilde{A} \to \widetilde{B}$. In this case, condition (a) is equivalent to the assertion that f induces an equivalence $A \to B$, which follows from Lemma 7.4.2.9. □

7.4.3 Connectivity and Finiteness of the Cotangent Complex

Let $\phi : A \to B$ be a morphism of connective $\mathbb{E}_\infty$-rings. According to Remark 7.3.3.4, the relative cotangent complex $L_{B/A}$ vanishes whenever ϕ is an equivalence. We may therefore regard $L_{B/A}$ as a measure of a failure of f to be an equivalence. Our goal in this section is to prove that this is a good measure in (at least) two respects:

(1) The relative cotangent complex $L_{B/A}$ is highly connected if ϕ is highly connected. Moreover, the converse holds if ϕ induces an isomorphism of commutative rings $\pi_0 A \to \pi_0 B$ (Corollary 7.4.3.2).

(2) If B is locally of finite presentation over A (Definition 7.2.4.26), then the relative cotangent complex $L_{B/A}$ is perfect. Conversely, if $L_{B/A}$ is perfect and $\pi_0 B$ is a finitely presented $\pi_0 A$-algebra, then B is locally of finite presentation over A. Similar results hold if we replace "locally of finite presentation" by "almost of finite presentation" and "perfect" by "almost perfect" (Theorem 7.4.3.18).

We begin with the following more precise formulation of (1):

Theorem 7.4.3.1. *Let $f : A \to B$ be a morphism between connective $\mathbb{E}_\infty$-rings. Assume that* $\mathrm{cofib}(f)$ *is n-connective for $n \geq 0$. Then there is a canonical $(2n)$-connective map of B-modules $\epsilon_f : B \otimes_A \mathrm{cofib}(f) \to L_{B/A}$.*

We will give the proof of Theorem 7.4.3.1 later in this section. First, let us deduce some consequences.

Corollary 7.4.3.2. *Let $f : A \to B$ be a map of connective $\mathbb{E}_\infty$-rings. Assume that* $\mathrm{cofib}(f)$ *is n-connective, for $n \geq 0$. Then the relative cotangent complex $L_{B/A}$ is n-connective. The converse holds provided that f induces an isomorphism $\pi_0 A \to \pi_0 B$.*

小红书
小红书号:3189205503 qq

Proof. Let $\epsilon_f : B \otimes_A \mathrm{cofib}(f) \to L_{B/A}$ be the map described in Theorem 7.4.3.1, so that we have a fiber sequence of B-modules:

$$\mathrm{fib}(\epsilon_f) \to B \otimes_A \mathrm{cofib}(f) \to L_{B/A}$$

To prove that $L_{B/A}$ is n-connective, it suffices to show that $\mathrm{cofib}(f) \otimes_A B$ is n-connective and that $\mathrm{fib}(\epsilon_f)$ is $(n-1)$-connective. The first assertion is obvious, and the second follows from Theorem 7.4.3.1 since $2n \geq n - 1$.

To prove the converse, let us suppose that $\mathrm{cofib}(f)$ is *not* n-connective. We wish to show that $L_{B/A}$ is not n-connective. Let us assume that n is chosen as small as possible, so that $\mathrm{cofib}(f)$ is $(n-1)$-connective. By assumption, f induces an isomorphism $\pi_0 A \to \pi_0 B$, so we must have $n \geq 2$. Applying Theorem 7.4.3.1, we conclude that ϵ_f is $(2n-2)$-connective. Since $n \geq 2$, we deduce in particular that ϵ_f is n-connective, so that the map $\pi_{n-1}(B \otimes_A \mathrm{cofib}(f)) \to \pi_{n-1} L_{B/A}$ is an isomorphism. Since $\mathrm{cofib}(f)$ is $(n-1)$-connective and $\pi_0 A \simeq \pi_0 B$, the map $\pi_{n-1} \mathrm{cofib}(f) \to \pi_{n-1}(B \otimes_A \mathrm{cofib}(f))$ is an isomorphism. It follows that $\pi_{n-1} \mathrm{cofib}(f) \to \pi_{n-1} L_{B/A}$ is also an isomorphism, so that $\pi_{n-1} L_{B/A}$ is nonzero. □

Corollary 7.4.3.3. *Let A be a connective $\mathbb{E}_\infty$-ring. Then the absolute cotangent complex L_A is connective.*

Proof. Apply Corollary 7.4.3.2 to the unit map $S \to A$ in the case $n = 0$. □

Corollary 7.4.3.4. *Let $f : A \to B$ be a map of connective $\mathbb{E}_\infty$-rings. Then f is an equivalence if and only if the following conditions are satisfied:*

(1) *The map f induces an isomorphism $\pi_0 A \to \pi_0 B$.*

(2) *The relative cotangent complex $L_{B/A}$ vanishes.*

Corollary 7.4.3.5. *Let $f : A \to B$ be a map of connective $\mathbb{E}_\infty$-rings. Assume that $\mathrm{cofib}(f)$ is n-connective for $n \geq 0$. Then the induced map $L_f : L_A \to L_B$ has n-connective cofiber. In particular, the canonical map $\pi_0 L_A \to \pi_0 L_{\pi_0 A}$ is an isomorphism.*

Proof. The map L_f factors as a composition

$$L_A \xrightarrow{g} B \otimes_A L_A \xrightarrow{g'} L_B.$$

We observe that $\mathrm{cofib}(g) \simeq \mathrm{cofib}(f) \otimes_A L_A$. Since the cotangent complex L_A is connective (Corollary 7.4.3.3) and $\mathrm{cofib}(f)$ is n-connective, we conclude that $\mathrm{cofib}(g)$ is n-connective. It will therefore suffice to show that $\mathrm{cofib}(g') \simeq L_{B/A}$ is n-connective. Let $\epsilon_f : B \otimes_A \mathrm{cofib}(f) \to L_{B/A}$ be as in Theorem 7.4.3.1, so we have a fiber sequence

$$B \otimes_A \mathrm{cofib}(f) \to L_{B/A} \to \mathrm{cofib}(\epsilon_f).$$

小红书
小红书号:3189205503 qq

It therefore suffices to show that $B \otimes_A \mathrm{cofib}(f)$ and $\mathrm{cofib}(\epsilon_f)$ are n-connective. The first assertion follows immediately from the n-connectivity of $\mathrm{cofib}(f)$, and the second from Theorem 7.4.3.1 since $2n + 1 \geq n$. □

Corollary 7.4.3.6. *Let $f : A \to B$ be a map of $\mathbb{E}_\infty$-rings, and suppose that $\mathrm{cofib}(f)$ is n-connective. Then there exists a canonical $(2n-1)$-connective map of A-modules $\mathrm{cofib}(f) \to L_{B/A}$.*

Proof. We have a fiber sequence

$$\mathrm{cofib}(f) \xrightarrow{\delta} B \otimes_A \mathrm{cofib}(f) \to \mathrm{cofib}(f) \otimes_A \mathrm{cofib}(f),$$

so that the map δ is $(2n-1)$-connective. If ϵ_f denotes the map appearing in the statement of Theorem 7.4.3.1, then $\epsilon_f \circ \delta$ is a $(2n-1)$-connective map $\mathrm{cofib}(f) \to L_{B/A}$. □

The theory of the cotangent complex of $\mathbb{E}_\infty$-rings can be regarded as a homotopy-theoretic analogue of the classical theory of Kähler differentials. We now apply Theorem 7.4.3.1 to make this analogy more explicit. First, we need a bit of terminology. Recall that if R is a commutative ring, then the module of (absolute) Kähler differentials is the free R-module generated by the symbols $\{dr\}_{r \in R}$, subject to the relations

$$d(rr') = rdr' + r'dr$$

$$d(r + r') = dr + dr'.$$

We denote this R-module by Ω_R. Given a map of commutative rings $\eta : R' \to R$, we let $\Omega_{R/R'}$ denote the quotient of Ω_R by the submodule generated by the elements $\{d\eta(r')\}_{r' \in R'}$.

Remark 7.4.3.7. Let $\eta : R' \to R$ be a homomorphism of commutative rings. Then we have a canonical short exact sequence

$$\mathrm{Tor}_0^{R'}(\Omega_{R'}, R) \to \Omega_R \to \Omega_{R/R'} \to 0$$

in the category of R-modules.

Lemma 7.4.3.8. *Let A be a discrete $\mathbb{E}_\infty$-ring. Then there is a canonical isomorphism*

$$\pi_0 L_A \simeq \Omega_{\pi_0 A}$$

in the category of (discrete) $\pi_0 A$-modules.

Proof. It will suffice to show that $\pi_0 L_A$ and $\Omega_{\pi_0 A}$ corepresent the same functor on the ordinary category of modules over the commutative ring $\pi_0 A$. Let M be a $\pi_0 A$-module, which we will identify with the corresponding discrete A-module. We have homotopy equivalences

$$\mathrm{Map}_{\mathrm{Mod}_A}(\pi_0 L_A, M) \simeq \mathrm{Map}_{\mathrm{Mod}_A}(L_A, M) \simeq \mathrm{Map}_{\mathrm{CAlg}_{/A}}(A, A \oplus M).$$

小红书
小红书号:3189205503 qq

Since A and M are both discrete, the space on the right is homotopy equivalent to the discrete set of ring homomorphisms from $\pi_0 A$ to $\pi_0(A \oplus M)$ which reduce to the identity on $\pi_0 A$. These are simply derivations from $\pi_0 A$ into M in the usual sense, which are classified by $(\pi_0 A)$-module homomorphisms from $\Omega_{\pi_0 A}$ into M. □

Proposition 7.4.3.9. *Let $f : A \to B$ be a morphism of connective $\mathbb{E}_\infty$-rings. Then:*

(1) *The relative cotangent $L_{B/A}$ is connective.*

(2) *As a $\pi_0 B$-module, $\pi_0 L_{B/A}$ is canonically isomorphic to the module of relative Kähler differentials $\Omega_{\pi_0 B/\pi_0 A}$.*

Proof. Assertion (1) follows from Corollary 7.4.3.3 and the existence of a fiber sequence

$$L_A \otimes_A B \to L_B \to L_{B/A}.$$

Associated to this fiber sequence we have a long exact sequence

$$\pi_0(L_A \otimes_A B) \xrightarrow{g} \pi_0 L_B \to \pi_0 L_{B/A} \to \pi_{-1}(L_A \otimes_A B) \simeq 0$$

of discrete $\pi_0 B$-modules. Consequently, we may identify $\pi_0 L_{B/A}$ with the cokernel of the map g.

Using Corollary 7.4.3.5 and Lemma 7.4.3.8, we can identify $\pi_0 L_A$ and $\pi_0 L_B$ with the modules $\Omega_{\pi_0 A}$ and $\Omega_{\pi_0 B}$, respectively. Using Corollary 7.2.1.23, we can identify $\pi_0(L_A \otimes_A B)$ with the discrete $\pi_0 B$-module $\mathrm{Tor}_0^{\pi_0 A}(\Omega_{\pi_0 A}, \pi_0 B)$. The desired result now follows from the short exact sequence of Remark 7.4.3.7. □

We now turn to the proof of Theorem 7.4.3.1. We begin with a construction of the map ϵ_f. For later applications, it will be useful to work in a slightly more general setting.

Construction 7.4.3.10. Let $\mathcal{C}$ denote a symmetric monoidal stable ∞-category equipped with a t-structure which satisfies the following conditions:

(*i*) The ∞-category $\mathcal{C}$ is presentable.

(*ii*) The tensor product $\otimes : \mathcal{C} \times \mathcal{C} \to \mathcal{C}$ preserves small colimits separately in each variable.

(*iii*) The full subcategory $\mathcal{C}_{\geq 0} \subseteq \mathcal{C}$ contains the unit object and is closed under tensor products.

Let $f : A \to B$ be a morphism of commutative algebra objects of $\mathcal{C}$, so that f induces a map of B-module objects $\eta : L_B \to L_{B/A}$. We let B^η denote the associated square-zero extension of B by $L_{B/A}[-1]$. Since the restriction of η to L_A is nullhomotopic, the map f factors as a composition

$$A \xrightarrow{f'} B^\eta \xrightarrow{f''} B.$$

We therefore obtain a map of A-modules $\mathrm{cofib}(f) \to \mathrm{cofib}(f'')$, which is adjoint to a map of B-modules

$$\epsilon_f : B \otimes_A \mathrm{cofib}(f) \to \mathrm{cofib}(f'') \simeq L_{B/A}.$$

小红书 小红书号:3189205503 qq

Remark 7.4.3.11. The ∞-category of spectra (endowed with the smash product monoidal structure) satisfies conditions (i) through (iii) of Construction 7.4.3.10. However, these conditions are also satisfied in other situations of interest: for example, $\mathcal{C}$ might be the ∞-category of sheaves of spectra on a topological space X.

We can now state the following more precise version of Theorem 7.4.3.1:

Theorem 7.4.3.12. *Let $\mathcal{C}$ be a symmetric monoidal stable ∞-category equipped with a t-structure satisfying conditions (i) through (iii) of Construction 7.4.3.10. Let $f : A \to B$ be a morphism of commutative algebra objects of $\mathcal{C}_{\geq 0}$, and assume that $\mathrm{cofib}(f) \in \mathcal{C}_{\geq n}$. Let $\epsilon_f : B \otimes_A \mathrm{cofib}(f) \to L_{B/A}$ be as in Construction 7.4.3.10. Then $\mathrm{fib}(\epsilon_f) \in \mathcal{C}_{\geq 2n}$.*

The proof of Theorem 7.4.3.12 will require some preliminaries.

Remark 7.4.3.13. Let $\mathcal{C}$ be as in Construction 7.4.3.10, and let $M \in \mathcal{C}_{\geq m}$. Then each tensor power $M^{\otimes k}$ belongs to $\mathcal{C}_{\geq km}$. Using the closure of $\mathcal{C}_{\geq km}$ under colimits, we conclude that the symmetric power $\mathrm{Sym}^k(M)$ belongs to $\mathcal{C}_{\geq km}$.

Proposition 7.4.3.14. *Let $\mathcal{C}$ be as in Construction 7.4.3.10, let $M \in \mathcal{C}$, and let $A = \mathrm{Sym}^* M$ denote the commutative algebra object of $\mathcal{C}$ freely generated by M. Then there is a canonical equivalence $L_A \simeq A \otimes M$ in the ∞-category of A-modules.*

Proof. For every A-module N, we have a chain of homotopy equivalences

$$\begin{aligned} \mathrm{Map}_{\mathrm{Mod}_A(\mathcal{C})}(A \otimes M, N) &\simeq \mathrm{Map}_{\mathcal{C}}(M, N) \\ &\simeq \mathrm{Map}_{\mathcal{C}_{/A}}(M, A \oplus N) \\ &\simeq \mathrm{Map}_{\mathrm{CAlg}(\mathcal{C})_{/A}}(A, A \oplus N) \\ &\simeq \mathrm{Map}_{\mathrm{Mod}_A(\mathcal{C})}(L_A, N). \end{aligned}$$

It follows that $M \otimes A$ and L_A corepresent the same functor in the homotopy category $\mathrm{hMod}_A(\mathcal{C})$, and are therefore equivalent. □

Our connectivity estimates for the cotangent complex all hinge on the following basic observation:

Lemma 7.4.3.15. *Let $\mathcal{C}$ be as in Construction 7.4.3.10 and let $\mathrm{Sym}^* : \mathcal{C} \to \mathrm{CAlg}(\mathcal{C})$ denote a left adjoint to the forgetful functor $\mathrm{CAlg}(\mathcal{C}) \to \mathcal{C}$. Let $f : A \to B$ be a morphism in $\mathrm{CAlg}(\mathcal{C}_{\geq 0})$ and assume that $\mathrm{cofib}(f)$ is n-connective for some $n \geq 0$. Then there exists an object $M \in \mathcal{C}_{\geq n-1}$ and*

小红书
小红书号:3189205503 qq

a commutative diagram

$$\begin{array}{ccc} \mathrm{Sym}^* M & \xrightarrow{\phi} & \mathbf{1} \\ \downarrow & & \downarrow \\ A & \longrightarrow & A' \\ & \searrow^{f} & \downarrow{\scriptstyle f'} \\ & & B \end{array}$$

in $\mathrm{CAlg}(\mathcal{C})$*, where the upper square is a pushout,* $A' \in \mathrm{CAlg}(\mathcal{C}_{\geq 0})$*,* $\mathrm{cofib}(f') \in \mathcal{C}_{\geq n+1}$*, and* ϕ *is adjoint to the zero map* $M \to \mathbf{1}$ *in* $\mathcal{C}$*. Here* $\mathbf{1}$ *denotes the unit object of* $\mathcal{C}$*, regarded as an initial object of* $\mathrm{CAlg}(\mathcal{C})$*.*

Proof. We will abuse notation by not distinguishing between the objects $A, B \in \mathrm{CAlg}(\mathcal{C})$ and their images in $\mathcal{C}$. Let $M = \mathrm{fib}(f)$, so that we have a pushout diagram of spectra

$$\begin{array}{ccc} M & \longrightarrow & 0 \\ \downarrow & & \downarrow \\ A & \xrightarrow{f} & B. \end{array}$$

Invoking the universal property of Sym^*, we obtain a commutative diagram

$$\begin{array}{ccc} \mathrm{Sym}^* M & \longrightarrow & \mathrm{Sym}^* 0 \\ \downarrow & & \downarrow \\ \mathrm{Sym}^* A & \longrightarrow & \mathrm{Sym}^* B \\ \downarrow & & \downarrow \\ A & \longrightarrow & B \end{array}$$

in the ∞-category $\mathrm{CAlg}(\mathcal{C})$, where the upper square is a pushout. We observe that $\mathrm{Sym}^* 0$ is equivalent to the unit object $\mathbf{1}$. Let A' denote the tensor product $A \otimes_{\mathrm{Sym}^* M} \mathbf{1}$ so that we obtain a commutative diagram

$$\begin{array}{ccc} \mathrm{Sym}^* M & \xrightarrow{\phi} & \{\mathbf{1}\} \\ \downarrow & & \downarrow \\ A & \longrightarrow & A' \\ & \searrow^{f} & \downarrow{\scriptstyle f'} \\ & & B \end{array}$$

as above. Since A' can also be identified with the tensor product

$$A \otimes_{\mathrm{Sym}^* A} \mathrm{Sym}^* B,$$

小红书
小红书号:3189205503 qq

we conclude that A' is connective. The only nontrivial point is to verify that $\mathrm{cofib}(f') \in \mathcal{C}_{\geq n+1}$. Suppose first that $n = 0$; in this case, we wish to show that f' induces an epimorphism $\pi_0 A' \to \pi_0 B$ in the heart of $\mathcal{C}$. To prove this, we observe that the counit map

$$f'' : \mathrm{Sym}^* B \to B$$

factors through f'. The map f'' induces an epimorphism on all homotopy groups, because the underlying morphism in $\mathcal{C}$ admits a section.

We now treat the more generic case $n \geq 1$. Let I denote the fiber of the projection map $\mathrm{Sym}^* M \to \mathbf{1}$, so that we have a map of fiber sequences

$$\begin{array}{ccccc} A \otimes_{\mathrm{Sym}^* M} I & \longrightarrow & A & \longrightarrow & A' \\ \downarrow{\scriptstyle g} & & \downarrow{\scriptstyle =} & & \downarrow{\scriptstyle f'} \\ M & \longrightarrow & A & \longrightarrow & B \end{array}$$

in the ∞-category $\mathcal{C}$. Consequently, we obtain an equivalence of spectra $\mathrm{cofib}(f') \simeq \mathrm{cofib}(g)[1]$, so it will suffice to show that $\mathrm{cofib}(g) \in \mathcal{C}_{\geq n}$. Using Proposition 3.1.3.13, we can identify I with the coproduct $\oplus_{i>0} \mathrm{Sym}^i(M)$. The map g admits a section, given by the composition

$$M \simeq \mathrm{Sym}^1(M) \to I \to A \otimes_{\mathrm{Sym}^* M} I.$$

We may therefore identify the $\mathrm{fib}(g)$ with a summand of the tensor product $A \otimes_{\mathrm{Sym}^* M} I$. It will now suffice to show that this tensor product is $(n-1)$-connective. Since A and $\mathrm{Sym}^* M$ are connective, it will suffice to show that I is $(n-1)$-connective. This follows immediately from Remark 7.4.3.13. □

Lemma 7.4.3.16. *Let $\mathcal{C}$ be as in Construction 7.4.3.10. Let $f : A \to B$ be a morphism in $\mathrm{CAlg}(\mathcal{C}_{\geq 0})$, and choose objects $M, N \in \mathrm{Mod}_B(\mathcal{C}_{\geq 0})$. If $\mathrm{cofib}(f)$ is n-connective, then the induced map $\theta : M \otimes_A N \to M \otimes_B N$ is n-connective.*

Proof. We note that the fiber $\mathrm{fib}(\theta)$ can be identified with the geometric realization of a simplicial object $C_\bullet$ of $\mathcal{C}$, given by

$$C_\bullet = \mathrm{fib}(\mathrm{Bar}_A(M, N)_\bullet \to \mathrm{Bar}_B(M, N)_\bullet).$$

Using the spectral sequence of Proposition 1.2.4.5, we are reduced to showing that each of the objects C_m belongs to $\mathcal{C}_{\geq n-m}$. When $m = 0$, C_m vanishes and the result is obvious. Assume therefore that $m > 0$; we claim that $C_m \in \mathcal{C}_{\geq n-1} \subseteq \mathcal{C}_{\geq n-m}$. That is, we claim that the canonical map

$$M \otimes A^{\otimes m} \otimes N \to M \otimes B^{\otimes m} \otimes N$$

is $(n-1)$-connective. This follows immediately from the $(n-1)$-connectivity of f. □

小红书
小红书号:3189205503 qq

Lemma 7.4.3.17. *Let $\mathcal{C}$ be as in Construction 7.4.3.10 and let $f : A \to B$ be a morphism in $\mathrm{CAlg}(\mathcal{C}_{\geq 0})$. Suppose that $n \geq 0$ and that f induces an equivalence $\tau_{\leq n} A \to \tau_{\leq n} B$. Then $\tau_{\leq n} L_{B/A} \simeq 0$.*

Proof. It will suffice to show that f induces an equivalence $\tau_{\leq n}(B \otimes_A L_A) \to \tau_{\leq n} L_B$. To this end, choose an arbitrary object $M \in \mathrm{Mod}_B(\mathcal{C})_{\leq n}$; we wish to show that the canonical map

$$\theta : \mathrm{Map}_{\mathrm{Mod}_B(\mathcal{C})}(L_B, M) \to \mathrm{Map}_{\mathrm{Mod}_A(\mathcal{C})}(L_A, M)$$

is a homotopy equivalence. Equivalently, we must show that the map

$$\theta' : \mathrm{Map}_{\mathrm{CAlg}(\mathcal{C})_{/B}}(B, B \oplus M) \to \mathrm{Map}_{\mathrm{CAlg}(\mathcal{C})_{/B}}(A, B \oplus M)$$

is an equivalence. Since A and B belong to $\mathrm{CAlg}(\mathcal{C}_{\geq 0})$, we may replace M by $\tau_{\geq 0} M$ and thereby reduce to the case where $M \in \mathcal{C}_{\geq 0}$. We have a pullback diagram

$$\begin{array}{ccc} B \oplus M & \longrightarrow & \tau_{\leq n} B \oplus M \\ \downarrow & & \downarrow \\ B & \longrightarrow & \tau_{\leq n} B, \end{array}$$

so that θ' is equivalent to the map

$$\theta'' : \mathrm{Map}_{\mathrm{CAlg}(\mathcal{C})_{/\tau_{\leq n} B}}(B, (\tau_{\leq n} B) \oplus M) \to \mathrm{Map}_{\mathrm{CAlg}(\mathcal{C})_{/\tau_{\leq n} B}}(A, \tau_{\leq n} B \oplus M)$$

Since $\tau_{\leq n} B$ and $\tau_{\leq n} B \oplus M$ belong to $\mathrm{CAlg}(\mathcal{C}_{\geq 0} \cap \mathcal{C}_{\leq n})$, the condition that f induces an equivalence $\tau_{\leq n} A \to \tau_{\leq n} B$ ensures that θ'' is a homotopy equivalence. □

Proof of Theorem 7.4.3.12. Let us say that a morphism $f : A \to B$ in $\mathrm{CAlg}(\mathcal{C})$ is *n-good* if $\mathrm{fib}(\epsilon_f) \in \mathcal{C}_{\geq 2n}$. We make the following observations:

(a) Suppose given a commutative triangle

$$\begin{array}{ccc} & B & \\ {\scriptstyle f}\nearrow & & \searrow{\scriptstyle g} \\ A & \xrightarrow{h} & C \end{array}$$

in $\mathrm{CAlg}(\mathcal{C}_{\geq 0})$. If f and g are n-good and $\mathrm{cofib}(f), \mathrm{cofib}(g) \in \mathcal{C}_{\geq n}$, then h is n-good. To prove this, we consider the diagram of C-modules

$$\begin{array}{ccccc} C \otimes_A \mathrm{cofib}(f) & \longrightarrow & C \otimes_A \mathrm{cofib}(h) & \longrightarrow & C \otimes_A \mathrm{cofib}(g) \\ \downarrow{\scriptstyle \epsilon'} & & \downarrow{\scriptstyle \epsilon_h} & & \downarrow{\scriptstyle \epsilon''} \\ C \otimes_B L_{B/A} & \longrightarrow & L_{C/A} & \longrightarrow & L_{C/B}. \end{array}$$

小红书
小红书号:3189205503 qq

Here $\epsilon' = \mathrm{id}_C \otimes \epsilon_f$, so that $\mathrm{fib}(\epsilon') \in \mathcal{C}_{\geq 2n}$. It will therefore suffice to show that $\mathrm{fib}(\epsilon'') \in \mathcal{C}_{\geq 2n}$. We can write ϵ'' as a composition

$$C \otimes_A \mathrm{cofib}(g) \xrightarrow{\phi} C \otimes_B \mathrm{cofib}(g) \xrightarrow{\epsilon_g} L_{C/B},$$

so that we have a fiber sequence

$$\mathrm{fib}(\phi) \to \mathrm{fib}(\epsilon'') \to \mathrm{fib}(\epsilon_g).$$

It will therefore suffice to show that $\mathrm{fib}(\phi) \in \mathcal{C}_{\geq 2n}$. This follows from Lemma 7.4.3.16, since $\mathrm{cofib}(f)$ and $\mathrm{cofib}(g)$ are n-connective.

(b) Suppose given a pushout diagram

$$\begin{array}{ccc} A & \xrightarrow{f} & B \\ \downarrow & & \downarrow \\ A' & \xrightarrow{f'} & B' \end{array}$$

in $\mathrm{CAlg}(\mathcal{C})$, where $B, B' \in \mathrm{CAlg}(\mathcal{C}_{\geq 0})$. If f is n-good, then so is f'. This follows immediately from the equivalence $\mathrm{fib}(\epsilon_{f'}) \simeq B' \otimes_B \mathrm{fib}(\epsilon_f)$.

(c) Let $f : A \to B$ be an arbitrary morphism in $\mathrm{CAlg}(\mathcal{C})$. Then the domain $B \otimes_A \mathrm{cofib}(f)$ of the morphism ϵ_f can be identified with the cofiber of the map $B \to B \otimes_A B$ given by the inclusion of the second factor. This map admits a left homotopy inverse (given by the multiplication on B).

(d) Let $M \in \mathcal{C}_{\geq n-1}$, let $\mathbf{1}$ denote the unit object of $\mathcal{C}$, and consider the map $f : \mathrm{Sym}^* M \to \mathbf{1}$ in $\mathrm{CAlg}(\mathcal{C})$ which is adjoint to the zero map $M \to \mathbf{1}$ in $\mathcal{C}$. Then f is n-good. To prove this, we will explicitly compute both the domain and codomain of ϵ_f.

Using Corollary 7.3.3.6 we obtain a fiber sequence

$$\mathbf{1} \otimes_{\mathrm{Sym}^* M} L_{\mathrm{Sym}^* M} \to L_{\mathbf{1}} \to L_{\mathbf{1}/\mathrm{Sym}^* M}$$

in $\mathrm{Mod}_{\mathbf{1}}(\mathcal{C}) = \mathcal{C}$. Using Proposition 7.4.3.14, we may rewrite this fiber sequence

$$M \to 0 \to L_{\mathbf{1}/\mathrm{Sym}^* M}$$

so that the codomain of ϵ_f is given by $L_{\mathbf{1}/\mathrm{Sym}^* \mathbf{M}} \simeq M[1]$.

We next observe that the pushout diagram

$$\begin{array}{ccc} M & \longrightarrow & 0 \\ \downarrow & & \downarrow \\ 0 & \longrightarrow & M[1] \end{array}$$

小红书
小红书号:3189205503 qq

induces an equivalence of $\mathbb{E}_\infty$-rings $\mathbf{1} \otimes_{\mathrm{Sym}^* M} \mathbf{1} \simeq \mathrm{Sym}^* M[1]$. Invoking (c), we deduce that $\mathbf{1} \otimes_{\mathrm{Sym}^* M} \mathrm{cofib}(f)$ can be identified with the cofiber of the unit map $\mathbf{1} \to \mathrm{Sym}^* M[1]$. Using Proposition 3.1.3.13, we can identify this fiber with the direct sum $\oplus_{i>0} \mathrm{Sym}^i(M[1])$.

We now observe that the composition

$$M[1] \simeq \mathrm{Sym}^1(M[1])[-1] \to \oplus_{i>0} \mathrm{Sym}^i(M[1])[-1] \xrightarrow{\epsilon_f} M[1]$$

is homotopic to the identity. Consequently, the fiber of ϵ_f can be identified with the direct sum $\oplus_{i \geq 2} \mathrm{Sym}^i(M[1])$. To complete the proof that $\mathrm{fib}(\epsilon_f) \in \mathcal{C}_{\geq 2n}$, it will suffice to show that each symmetric power $\mathrm{Sym}^i(M[1])$ belongs to $\mathcal{C}_{\geq 2n}$ for $i \geq 2$. This follows immediately from Remark 7.4.3.13.

(e) If $f : A \to B$ is a morphism in $\mathrm{CAlg}(\mathcal{C}_{\geq 0})$ which induces an equivalence $\tau_{\leq 2n-1} A \to \tau_{\leq 2n-1} B$, then f is n-good. To prove this, we note that $B \otimes_A \mathrm{cofib}(f)$ and $L_{B/A}[1]$ both belong to $\mathcal{C}_{\geq 2n}$ (see Lemma 7.4.3.17).

We are now ready to proceed with the proof of Theorem 7.4.3.1. Let $f : A \to B$ be a morphism in $\mathrm{CAlg}(\mathcal{C}_{\geq 0})$ and suppose that $\mathrm{cofib}(f) \in \mathcal{C}_{\geq n}$; we wish to show that f is n-good. Applying Lemma 7.4.3.15 repeatedly, we deduce the existence of a sequence of objects

$$A_n \to A_{n+1} \to A_{n+2} \to \ldots$$

in $\mathrm{CAlg}(\mathcal{C})_{/B}$, with the following properties:

(i) The object A_n coincides with A (as an object of $\mathrm{CAlg}(\mathcal{C})_{/B}$).

(ii) For $m \geq n$, the cofiber of the map $A_m \to B$ belongs to $\mathcal{C}_{\geq m}$, and $A_m \in \mathrm{CAlg}(\mathcal{C}_{\geq 0})$.

(iii) For each $m \geq n$, there exists an object $M \in \mathcal{C}_{\geq m-1}$ and a pushout diagram

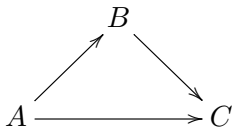
$$\begin{array}{ccc} \mathrm{Sym}^* M & \xrightarrow{\phi_m} & \mathbf{1} \\ \downarrow & & \downarrow \\ A_m & \xrightarrow{g_{m,m+1}} & A_{m+1}, \end{array}$$

where $g_{j,k}$ denotes the morphism in $\mathrm{CAlg}(\mathcal{C})$ underlying the map from A_j to A_k in our direct system, and ϕ_m is adjoint to the zero map $M \to \mathbf{1}$ in $\mathcal{C}$.

Using (e), we deduce that the map $A_{2n+1} \to B$ is n-good. Using (a), we are reduced to showing that the maps $g_{m,m+1}$ are n-good for $m \leq 2n$. Using (b) and (iii), we are reduced to showing that each of the morphisms ϕ_m is n-good, which follows immediately from (d). □

We close this section by studying the finiteness properties of the relative cotangent complex $L_{B/A}$ for a map $A \to B$ of $\mathbb{E}_\infty$-rings. Our main result can be formulated as follows:

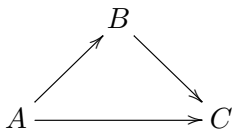
小红书
小红书号:3189205503 qq



Theorem 7.4.3.18. *Let A be a connective $\mathbb{E}_\infty$-ring, and let B be a connective $\mathbb{E}_\infty$-algebra over A. Then:*

(1) *If B is locally of finite presentation over A, then $L_{B/A}$ is perfect as a B-module. The converse holds provided that $\pi_0 B$ is finitely presented as a $\pi_0 A$-algebra.*

(2) *If B is almost of finite presentation over A, then $L_{B/A}$ is almost perfect as a B-module. The converse holds provided that $\pi_0 B$ is finitely presented as a $\pi_0 A$-algebra.*



As an immediate consequence, we deduce the following analogue of Remark 7.2.4.29:

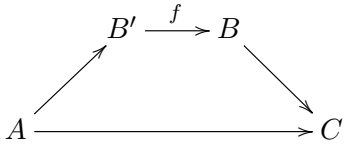
Corollary 7.4.3.19. *Suppose given a commutative diagram*

of connective $\mathbb{E}_\infty$-rings. Assume furthermore that B is of almost of finite presentation over A. Then C is almost of finite presentation over A if and only if C is almost of finite presentation over B.

Proof of Theorem 7.4.3.18. We first prove the forward implications. It will be convenient to phrase these results in a slightly more general form. Suppose given a commutative diagram σ:

of connective $\mathbb{E}_\infty$-rings, and let $F(\sigma) = L_{B/A} \otimes_B C$. We will show:

($1'$) If B is locally of finite presentation as an $\mathbb{E}_\infty$-algebra over A, then $F(\sigma)$ is perfect as a C-module.



($2'$) if B is almost of finite presentation as an $\mathbb{E}_\infty$-algebra over A, then $F(\sigma)$ is almost perfect as a C-module.

We will obtain the forward implications of (1) and (2) by applying these results in the case $B = C$.

We first observe that the construction $\sigma \mapsto F(\sigma)$ defines a functor from $\mathrm{CAlg}_{A//C}$ into Mod_C. Using Remark 7.3.2.18 and Proposition HTT.4.3.1.10 , we deduce that this functor preserves colimits. Since the collection of finitely presented C-modules is closed under finite colimits and retracts, it will suffice to prove ($1'$) in the case where B is finitely generated and free. In this case, $B = \mathrm{Sym}^*_A M$ for some finitely generated free A-module M. Using Proposition 7.4.3.14, we deduce that $F(\sigma) \simeq M \otimes_A C$ is a finitely generated free C-module, as desired.

小红书
小红书号:3189205503 qq

We now prove $(2')$. It will suffice to show that for each $n \geq 0$, there exists a commutative diagram

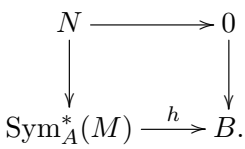
such that $L_{B'/A} \otimes_{B'} C$ is perfect, and the induced map

$$\tau_{\leq n}(L_{B'/A} \otimes_{B'} C) \to \tau_{\leq n}(L_{B/A} \otimes_B C)$$

is an equivalence. To guarantee the latter condition, it suffices to choose B' so that the relative cotangent complex $L_{B/B'}$ is n-connective. Using Corollary 7.4.3.2, it suffices to guarantee that f is $(n+1)$-connective. Moreover, assertion $(1')$ implies that $L_{B'/A} \otimes_{B'} C$ will be perfect so long as B' is locally of finitely presentation as an A-algebra. The existence of a commutative A-algebra with the desired properties now follows from Proposition 7.2.4.27.

We now prove the reverse implication of (2). Assume that $L_{B/A}$ is almost perfect and that $\pi_0 B$ is a finitely presented as a (discrete) $\pi_0 A$-algebra. To prove (2), it will suffice to construct a sequence of maps

$$A \to B(-1) \to B(0) \to B(1) \to \ldots \to B$$



such that each $B(n)$ is locally of finite presentation as an A-algebra, and each map $f_n : B(n) \to B$ is $(n+1)$-connective. We begin by constructing $B(-1)$ with an even stronger property: the map f_{-1} induces an isomorphism $\pi_0 B(-1) \to \pi_0 B$. Choose a finite presentation

$$\pi_0 B \simeq (\pi_0 A)[x_1, \ldots, x_k]/(g_1, \ldots, g_m)$$

for the ordinary commutative ring $\pi_0 B$. Let M denote the free A-module generated by symbols $\{X_i\}_{1 \leq i \leq k}$, so that the elements $\{x_i\} \subseteq \pi_0 B$ determine a map of A-modules $M \to B$. Let $h : \mathrm{Sym}^*_A(M) \to B$ be the adjoint map. We observe that there is a canonical isomorphism $\pi_0(\mathrm{Sym}^*_A(M)) \simeq (\pi_0 A)[x_1, \ldots, x_k]$. It follows that the image of the induced map

$$\pi_0 \,\mathrm{fib}(h) \to \pi_0 \,\mathrm{Sym}^*_A(M)$$

can be identified with the ideal in $(\pi_0 A)[x_1, \ldots, x_k]$ generated by the elements $\{g_j\}_{1 \leq j \leq m}$. Choose elements $\{\overline{g}_j\}_{1 \leq j \leq m}$ in $\pi_0 \,\mathrm{fib}(h)$ lifting $\{g_j\}_{1 \leq j \leq m}$. Let N be the free A-module generated by symbols $\{G_j\}_{1 \leq j \leq m}$, so that the elements $\{\overline{g}_j\}_{1 \leq j \leq m}$ determine a map of A-modules $N \to \mathrm{fib}(h)$. This map classifies a commutative diagram of A-modules

小红书
小红书号:3189205503 qq

Adjoint to this, we obtain a commutative diagram

$$\begin{array}{ccc} \mathrm{Sym}^*_A N & \longrightarrow & A \\ \downarrow & & \downarrow \\ \mathrm{Sym}^*_A(M) & \longrightarrow & B \end{array}$$

in CAlg_A. Let $B(-1)$ denote the tensor product

$$A \otimes_{\mathrm{Sym}^*_A N} \mathrm{Sym}^*_A M.$$

Then the above diagram classifies a map of commutative A-algebras $f_{-1} : B(-1) \to B$. By construction, $B(-1)$ is of finite presentation over A, and f_{-1} induces an isomorphism

$$\pi_0 B(-1) \simeq (\pi_0 A)[x_1, \ldots, x_k]/(g_1, \ldots, g_m) \simeq \pi_0 B.$$

We now proceed in an inductive fashion. Assume that we have already constructed a connective A-algebra $B(n)$ which is of finite presentation over A, and an $(n+1)$-connective morphism $f_n : B(n) \to B$ of commutative A-algebras. Moreover, we assume that the induced map $\pi_0 B(n) \to \pi_0 B$ is an isomorphism (if $n \geq 0$ this is automatic; for $n = -1$ it follows from the specific construction given above). We have a fiber sequence of B-modules

$$L_{B(n)/A} \otimes_{B(n)} B \to L_{B/A} \to L_{B/B(n)}.$$

By assumption, $L_{B/A}$ is almost perfect. Assertion $(2')$ implies that $L_{B(n)/A} \otimes_{B(n)} B$ is perfect. Using Proposition 7.2.4.11, we deduce that the relative cotangent complex $L_{B/B(n)}$ is almost perfect. Moreover, Corollary 7.4.3.2 ensures that $L_{B/B(n)}$ is $(n+2)$-connective. It follows that $\pi_{n+2} L_{B/B(n)}$ is a finitely generated as a (discrete) module over $\pi_0 B$. Using Theorem 7.4.3.1 and the bijectivity of the map $\pi_0 B(n) \to \pi_0 B$, we deduce that the canonical map

$$\pi_{n+1} \mathrm{fib}(f_n) \to \pi_{n+2} L_{B/B(n)}$$

is bijective. Choose a finitely generated projective $B(n)$-module M and a map $M[n+1] \to \mathrm{fib}(f_n)$ such that the composition

$$\pi_0 M \simeq \pi_{n+1} M[n+1] \to \pi_{n+1} \mathrm{fib}(f) \simeq \pi_{n+2} L_{B/B(n)}$$

is surjective (for example, we can take M to be a free $B(n)$-module indexed by a set of generators for the $\pi_0 B$-module $\pi_{n+2} L_{B/B(n)}$). By construction, we have a commutative diagram of $B(n)$-modules

$$\begin{array}{ccc} M[n+1] & \longrightarrow & 0 \\ \downarrow & & \downarrow \\ B(n) & \longrightarrow & B. \end{array}$$

小红书
小红书号:3189205503 qq

Adjoint to this, we obtain a diagram

$$\begin{array}{ccc} \mathrm{Sym}^*_{B(n)}(M[n+1]) & \longrightarrow & B(n) \\ \downarrow & & \downarrow \\ B(n) & \longrightarrow & B. \end{array}$$

in the ∞-category of CAlg_A. We now define $B(n+1)$ to be the pushout

$$B(n) \otimes_{\mathrm{Sym}^*_{B(n)} M[n+1]} B(n),$$

and $f_{n+1} : B(n+1) \to B$ to be the induced map. It is clear that $B(n+1)$ is locally of finite presentation over $B(n)$, and therefore locally of finite presentation over A (Remark 7.2.4.29). To complete the proof of (2), it will suffice to show that the fiber of f_{n+1} is $(n+2)$-connective.

By construction, we have a commutative diagram

$$\begin{array}{ccccc} & & \pi_0 B(n+1) & & \\ & \overset{e'}{\nearrow} & & \overset{e''}{\searrow} & \\ \pi_0 B(n) & & \xrightarrow{\quad e \quad} & & \pi_0 B \end{array}$$

where the map e' is surjective and e is bijective. It follows that e' and e'' are also bijective. In view of Corollary 7.4.3.2, it will now suffice to show $L_{B/B(n+1)}$ is $(n+3)$-connective. We have a fiber sequence of B-modules

$$L_{B(n+1)/B(n)} \otimes_{B(n+1)} B \to L_{B/B(n)} \to L_{B/B(n+1)}$$

Using Proposition 7.4.3.14 and Proposition 7.3.3.7, we conclude that $L_{B(n+1)/B(n)}$ is canonically equivalent to $M[n+2] \otimes_{B(n)} B(n+1)$. We may therefore rewrite our fiber sequence as

$$M[n+2] \otimes_{B(n)} B \to L_{B/B(n)} \to L_{B/B(n+1)}.$$

The inductive hypothesis and Corollary 7.4.3.2 guarantee that $L_{B/B(n)}$ is $(n+2)$-connective. The $(n+3)$-connectiveness of $L_{B/B(n+1)}$ is therefore equivalent to the surjectivity of the map

$$\pi_0 M \simeq \pi_{n+2}(M[n+2] \otimes_{B(n)} B) \to \pi_{n+2} L_{B/B(n)},$$

which is evident from our construction. This completes the proof of (2).

To complete the proof of (1), we use the same strategy but make a more careful choice of M. Let us assume that $L_{B/A}$ is perfect. It follows from the above construction that each cotangent complex $L_{B/B(n)}$ is likewise perfect. Using Proposition 7.2.4.23, we may assume $L_{B/B(-1)}$ is of Tor-amplitude $\leq k+2$ for some $k \geq 0$. Moreover, for each $n \geq 0$ we have a fiber sequence of B-modules

$$L_{B/B(n-1)} \to L_{B/B(n)} \to P[n+2] \otimes_{B(n)} B,$$

小红书
小红书号:3189205503 qq

where P is finitely generated and projective, and therefore of Tor-amplitude ≤ 0. Using Proposition 7.2.4.23 and induction on n, we deduce that the Tor-amplitude of $L_{B/B(n)}$ is $\leq k+2$ for $n \leq k$. In particular, the B-module $\overline{M} = L_{B/B(k)}[-k-2]$ is connective and has Tor-amplitude ≤ 0. It follows from Remark 7.2.4.22 that $\overline{M}$ is a flat B-module. Invoking Proposition 7.2.4.20, we conclude that $\overline{M}$ is a finitely generated projective B-module. Using Corollary 7.2.2.19, we can choose a finitely generated projective $B(k)$-module M and an equivalance $M[k+2] \otimes_{B(k)} B \simeq L_{B/B(k)}$. Using this map in the construction outlined above, we guarantee that the relative cotangent complex $L_{B/B(k+1)}$ vanishes. It follows from Corollary 7.4.3.4 that the map $f_{k+1} : B(k+1) \to B$ is an equivalence, so that B is locally of finite presentation as an $\mathbb{E}_\infty$-algebra over A, as desired. □

7.5 ÉtaleMorphisms

In this section, we will develop an ∞-categorical generalization of the theory of étalemorphisms between commutative rings. We begin by recalling a definition from commutative algebra.

Definition 7.5.0.1. Let $f : A \to B$ be a map of commutative rings. We say that f is *étale* if the following conditions are satisfied:

(1) The commutative ring B is finitely presented as an A-algebra.

(2) The map f exhibits B as a flat A-module.

(3) The multiplication map $p : B \otimes_A B \to B$ is the projection onto a summand: that is, there exists another map of commutative rings $q : B \otimes_A B \to R$ such that p and q induce an isomorphism $B \otimes_A B \to B \times R$.

Remark 7.5.0.2. Condition (3) of Definition 7.5.0.1 is equivalent to the following assertion:

($*$) There exists an idempotent element $e \in B \otimes_A B$ such that p induces an isomorphism $(B \otimes_A B)[\frac{1}{e}] \simeq B$.

Indeed, if $B \otimes_A B \simeq B \times R$, we can take e to be the preimage of the element $(1,0) \in B \times R$. Conversely, if ($*$) is satisfied, then we can take $R = (B \otimes_A B)[\frac{1}{1-e}]$.

Remark 7.5.0.3. For any étalemap of commutative rings $f : A \to B$, the module of Kähler differentials $\Omega_{B/A}$ is trivial. Equivalently, for every B-module M, the projection map $p : B \oplus M \to B$ admits a unique section (as a map of A-modules). Indeed, if p has two sections s and s', then we get an induced map $f : B \otimes_A B \to B \oplus M$. If $e \in B \otimes_A B$ is the idempotent of Remark 7.5.0.2, then $f(e) = 1 + m$ for some $m \in M$ and is therefore invertible. It follows that f factors through the multiplication map $B \otimes_A B \to B$, so that $s = s'$.

Our goal in this section is to study the following generalization of Definition 7.5.0.1:

小红书
小红书号:3189205503 qq

Definition 7.5.0.4. Let $2 \leq k \leq \infty$, and let $\phi : A \to B$ be a map of $\mathbb{E}_k$-rings. We will say that ϕ is *étale* if the following conditions are satisfied:

(1) The underlying map of commutative rings $\pi_0 A \to \pi_0 B$ is étale(in the sense of Definition 7.5.0.1).

(2) The map ϕ exhibits B as a flat (left or right) A-module.

Remark 7.5.0.5. Suppose given a pushout diagram of $\mathbb{E}_\infty$-rings

$$\begin{array}{ccc} A & \longrightarrow & A' \\ \downarrow{\scriptstyle f} & & \downarrow{\scriptstyle f'} \\ B & \longrightarrow & B'. \end{array}$$

If f is étale, then so is f'. The flatness of f follows from Proposition 7.2.2.16. Moreover, Proposition 7.2.2.13 ensures that the induced diagram

$$\begin{array}{ccc} \pi_0 A & \longrightarrow & \pi_0 A' \\ \downarrow & & \downarrow \\ \pi_0 B & \longrightarrow & \pi_0 B' \end{array}$$

is a pushout in the category of ordinary commutative rings. Since the left vertical map is étale, it follows that the right vertical map is étale, so that f' is likewise étale.

One of our main results can be stated as follows:

Theorem 7.5.0.6. *Let $2 \leq k \leq \infty$, let R be an $\mathbb{E}_{k+1}$-ring, and let A be an $\mathbb{E}_k$-algebra over R. Let $(\mathrm{Alg}_R^{(k)})^{ét}_{A/}$ denote the full subcategory of $(\mathrm{Alg}_R^{(k)})_{A/}$ spanned by the étalemorphisms. Then the construction $B \mapsto \pi_0 B$ induces an equivalence from $(\mathrm{Alg}_R^{(k)})^{ét}_{A/}$ to the nerve of the ordinary category of étale$\pi_0 A$-algebras.*

More informally: given an $\mathbb{E}_k$-ring A and an étalemorphism of commutative rings $\pi_0 A \to B_0$, there exists an étalemap of $\mathbb{E}_k$-rings $f : A \to B$ and an isomorphism of $(\pi_0 A)$-algebras $\pi_0 B \simeq B_0$; moreover, B is determined uniquely up to equivalence.

Example 7.5.0.7. Let A be an $\mathbb{E}_k$-ring for $2 \leq k \leq \infty$ and let $x \in \pi_0 A$. Theorem 7.5.0.6 implies that there exists another $\mathbb{E}_k$-ring $A[x^{-1}]$, equipped with a map $A \to A[x^{-1}]$ which induces an isomorphism $(\pi_* A)[x^{-1}] \simeq \pi_*(A[x^{-1}])$. Using Proposition 7.2.3.20, we deduce that $A[x^{-1}]$ can be identified with the Ore localization $A[S^{-1}]$ where S is the multiplicatively closed subset $\{x^n\}_{n \geq 0} \subseteq \pi_0 A$.

小红书
小红书号:3189205503 qq

In the case $k = \infty$, it is possible to give a very direct proof of Theorem 7.5.0.6 using the deformation theory developed in §7.4.2. We will adopt a more roundabout strategy which also works in the case $k < \infty$. We will begin in §7.5.1 by formulating and proving an analogue of Theorem 7.5.0.6 in the case $k = 1$, assuming that R is the sphere spectrum and that A is connective. In §7.5.2, we will generalize this result to the case where A is not assumed to be connective, and in §7.5.3 we will generalize to the case where R is arbitrary. Finally, in §7.5.4 we will prove Theorem 7.5.0.6 in general, reducing to the case $k = 1$ using a mechanism provided by Theorem 5.1.2.2.

7.5.1 ÉtaleMorphisms of $\mathbb{E}_1$-Rings

Our goal in this section is to prove a version of Theorem 7.5.0.6 in the setting of $\mathbb{E}_1$-rings. The first step is to decide what we mean by an étalemap $\phi : A \to B$ of $\mathbb{E}_1$-rings. The definition that we adopt requires some mild commutativity assumptions on A and B.

Definition 7.5.1.1. Let A be an $\mathbb{E}_1$-ring. We will say that A is *quasi-commutative* if the following condition is satisfied: for every $x \in \pi_0 A$ and every $y \in \pi_n A$, we have $xy = yx \in \pi_n A$.

Remark 7.5.1.2. Let A be an $\mathbb{E}_k$ ring for $2 \leq k \leq \infty$. Then the underlying $\mathbb{E}_1$-ring of A is quasi-commutative. To see this, it suffices to observe that for $x \in \pi_0 A$, the spectrum maps $l_x, r_x : A \to A$ given by left and right multiplication by x are homotopic to one another (since the multiplication $A \otimes A \to A$ is commutative up to homotopy).

Remark 7.5.1.3. Let A be quasi-commutative $\mathbb{E}_1$-ring. Then $\pi_0 A$ is a commutative ring.

We now adapt Definition 7.5.0.4 to the setting of $\mathbb{E}_1$-rings.

Definition 7.5.1.4. Let $\phi : A \to B$ be a morphism of $\mathbb{E}_1$-rings. We will say that ϕ is *étale* if the following conditions are satisfied:

(1) The $\mathbb{E}_1$-rings A and B are quasi-commutative.

(2) The morphism ϕ induces an étalehomomorphism of commutative rings $\pi_0 A \to \pi_0 B$ (Definition 7.5.0.1).

(3) For every integer $n \in \mathbf{Z}$, the associated map $\mathrm{Tor}_0^{\pi_0 A}(\pi_n A, \pi_0 B) \to \pi_n B$ is an isomorphism of abelian groups.

Remark 7.5.1.5. In the situation of Definition 7.5.1.4, condition (1) guarantees that the left and right actions of $\pi_0 B$ on $\pi_n B$ agree, so that the map $\pi_n A \otimes_{\pi_0 A} \pi_0 B \to \pi_n B$ is unambiguously defined. In other words, if condition (1) is satisfied, then condition (3) is equivalent to either of the following assertions:

(3′) The map ϕ exhibits B as a flat left A-module.

小红书
小红书号:3189205503 qq

$(3'')$ The map ϕ exhibits B as a flat right A-module.

Remark 7.5.1.6. The collection of étalemorphisms between $\mathbb{E}_1$-rings is closed under composition. In particular, every equivalence of quasi-commutative $\mathbb{E}_1$-rings is étale.

Remark 7.5.1.7. Suppose given a commutative diagram

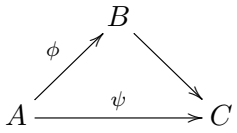
$$\begin{array}{ccccc} & & B & & \\ & \overset{f}{\nearrow} & & \overset{g}{\searrow} & \\ A & & \xrightarrow{\quad h \quad} & & C \end{array}$$

of quasi-commutative $\mathbb{E}_1$-rings. If f is étale, then g is étaleif and only if h is étale. The "only if" direction is Remark 7.5.1.6. For the converse, let us suppose that f and h are both étale. The induced maps $\pi_0 A \to \pi_0 B$ and $\pi_0 A \to \pi_0 C$ are both étalemap of ordinary commutative rings, so that g also induces an étalemap $\pi_0 B \to \pi_0 C$. We now observe that for $n \in \mathbf{Z}$, we have a commutative diagram

$$\begin{array}{ccc} \mathrm{Tor}_0^{\pi_0 B}(\mathrm{Tor}_0^{\pi_0 A}(\pi_n A, \pi_0 B), \pi_0 C) & \longrightarrow & \mathrm{Tor}_0^{\pi_0 A}(\pi_n A, \pi_0 C) \\ \downarrow & & \downarrow \\ \mathrm{Tor}_0^{\pi_0 B}(\pi_n B, \pi_0 C) & \longrightarrow & \pi_n C. \end{array}$$

Since f and h are flat, the vertical maps are isomorphisms. The upper horizontal map is obviously an isomorphism, so the lower horizontal map is an isomorphism as well.

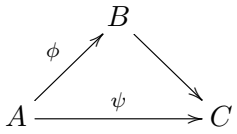
Remark 7.5.1.8. Let $\phi : A \to B$ be a morphism of $\mathbb{E}_k$-rings for $2 \leq k \leq \infty$. Then the underlying map of $\mathbb{E}_1$-rings satisfies condition (1) of Definition 7.5.1.4. It follows that ϕ is étaleas a map of $\mathbb{E}_k$-rings (in the sense of Definition 7.5.0.4) if and only if it is étaleas a map of $\mathbb{E}_1$-rings (in the sense of Definition 7.5.1.4).



Remark 7.5.1.9. Let A be an ordinary associative ring, regarded as a discrete $\mathbb{E}_1$-ring. Then A is quasi-commutative if and only if it is a commutative ring. A morphism $\phi : A \to B$ is étale(in the sense of Definition 7.5.1.4) if and only if B is discrete (as an $\mathbb{E}_1$-ring) and the underlying associative ring is a commutative ring which is étaleover A, in the sense of Definition 7.5.0.1.

The primary objective in this section gives a classification of étalemorphisms $\phi : A \to B$, in the case where A is a connective, quasi-commutative $\mathbb{E}_1$-ring. To state it, we need to introduce a bit of notation.

Notation 7.5.1.10. Let A be a quasi-commutative $\mathbb{E}_1$-ring. We let $\mathrm{Alg}^{(1),\text{ét}}_{A/}$ denote the full subcategory of $\mathrm{Alg}^{(1)}_{A/}$ spanned by the étalemorphisms $\phi : A \to B$. If we are given a morphism of $\mathbb{E}_1$-rings



小红书
小红书号:3189205503 qq

$\psi : A \to C$, we let $\mathrm{Alg}^{(1),\text{ét}}_{A//C}$ denote the full subcategory of $\mathrm{Alg}^{(1)}_{A//C}$ spanned by those diagrams

where ϕ is étale.

Let Ring denote the category of commutative rings. Given a commutative ring A, we let $\mathrm{Ring}^{\text{ét}}_{A/}$ denote the full subcategory of $\mathrm{Ring}_{A/}$ spanned by the étalering homomorphisms $A \to B$. If we are given a map of commutative rings $\psi : A \to C$, we let $\mathrm{Ring}^{\text{ét}}_{A//C}$ denote the full subcategory of $\mathrm{Ring}_{A//C}$ spanned by those diagrams

where ϕ is étale.

We can now state our main result:

Theorem 7.5.1.11. *Let A be an $\mathbb{E}_1$-ring which is connective and quasi-commutative. Then the forgetful functor $B \mapsto \pi_0 B$ determines an equivalence of ∞-categories*

$$\mathrm{Alg}^{(1),\acute{e}t}_{A/} \to \mathrm{N}(\mathrm{Ring}^{\acute{e}t}_{\pi_0 A/}).$$

The proof of Theorem 7.5.1.11 will occupy our attention for the remainder of this section. We begin by introducing a bit of terminology.

Definition 7.5.1.12. Let R be an $\mathbb{E}_1$-ring. We will say that an element $x \in \pi_0 R$ is *quasi-central* if the set $S = \{x^n\}_{n \geq 0}$ satisfies the left Ore condition (Definition 7.2.3.1).

Remark 7.5.1.13. Suppose that R is a quasi-commutative $\mathbb{E}_1$-ring. Then every element $x \in \pi_0 R$ is quasi-central. Let $R[x^{-1}]$ denote the localization $R[S^{-1}]$, where $S = \{x^n\}_{n \geq 0}$. Proposition 7.2.3.20 implies that the ring $\pi_* R[x^{-1}]$ is obtained from $\pi_* R$ by inverting the element x. It follows immediately that the localization map $R \to R[x^{-1}]$ is étale.

Lemma 7.5.1.14. *Let A and B be quasi-commutative $\mathbb{E}_1$-rings with connective covers $\widetilde{A}$ and $\widetilde{B}$. Then every element $x \in \pi_0(\widetilde{A} \otimes \widetilde{B})$ has quasi-central image in $\pi_0(A \otimes B)$. In particular, if A and B are connective, then every element of $\pi_0(A \otimes B)$ is quasi-central.*

Proof. We will say that a left $\widetilde{A} \otimes \widetilde{B}$-module P is *x-nilpotent* if it is $\{x^n\}_{n \geq 0}$-nilpotent, in the sense of Definition 7.2.3.8 (that is, if and only if every element of $\pi_* P$ is annihilated by left multiplication

小红书
小红书号:3189205503 qq

by power of x). If $M \in {}_{\widetilde{A}}\mathrm{BMod}_{\widetilde{A}}(\mathrm{Sp})$ and $N \in {}_{\widetilde{B}}\mathrm{BMod}_{\widetilde{B}}(\mathrm{Sp})$, then $M \otimes N$ has the structure of an $(\widetilde{A} \otimes \widetilde{B})$-bimodule spectrum. In this case, let $r_x^{M,N} : M \otimes N \to M \otimes N$ be the map given by right multiplication by x. Let us say that the pair (M, N) is *good* if the cofiber $\mathrm{cofib}(r_x^{M,N})$ is x-nilpotent (as a left $(\widetilde{A} \otimes \widetilde{B})$-module). According to Lemma 7.2.3.11, the image of x is quasi-central if and only if the pair (A, B) is good. The collection of all $N \in {}_B\mathrm{BMod}_B(\mathrm{Sp})$ such that (A, N) is good is closed under small colimits. It will therefore suffice to show that each pair $(A, \tau_{\geq n} B)$ is good. Using the same reasoning, we are reduced to showing that every pair of the form $(\tau_{\geq m} A, \tau_{\geq n} B)$ is good. Note that for $p \leq q + m + n$, the natural map

$$\pi_p \mathrm{cofib}(r_x^{\tau_{\leq m+q}\tau_{\geq m}A, \tau_{\leq n+q}\tau_{\leq n}B}) \to \pi_p \mathrm{cofib}(r_x^{\tau_{\geq m}A, \tau_{\geq n}B})$$

is an isomorphism. It will therefore suffice to show that each of the pairs $(\tau_{\leq m+q}\tau_{\geq m} A, \tau_{\leq n+q}\tau_{\geq n} B)$ is good. Since the collection of x-nilpotent left modules is closed under shifts and extensions, we are reduced to proving that the pair (M, N) is good in the case $M = \pi_{m'} A$, $N = \pi_{n'} B$.

Note that the commutative ring $\pi_0(\widetilde{A} \otimes \widetilde{B})$ can be identified with $\mathrm{Tor}_0^{\mathbf{Z}}(\pi_0 A, \pi_0 B)$. In particular, $\pi_0(\widetilde{A} \otimes \widetilde{B})$ is a commutative ring, and we have commutative ring homomorphisms

$$\pi_0 A \xrightarrow{\phi} \pi_0(\widetilde{A} \otimes \widetilde{A}) \xleftarrow{\psi} \pi_0 B.$$

We claim that every element $x \in \pi_0(A \otimes B)$ satisfies the following condition:

$(*)$ Left and right multiplication by x induce homotopic maps from the spectrum $M \otimes N$ to itself.

The collection of those elements of $\pi_0(\widetilde{A} \otimes \widetilde{B}$ which satisfy $(*)$ is stable under sums. Consequently, it suffices to prove $(*)$ in the case $x = \phi(a)\psi(b)$, for some $a \in \pi_0 A$ and $b \in \pi_0 B$. The desired result then follows from the observation that left and right multiplication by a induce the same map from $M \simeq N$ to itself (since M and N are discrete, it suffices to check this at the level of homotopy groups, in which case it follows from our assumption that A and B are quasi-commutative).

Let $X = \mathrm{cofib}(r_x^{M,N})$. We have a long exact sequence

$$\pi_p(M \otimes N) \xrightarrow{f} \pi_p M \otimes N \to \pi_p X \to \pi_{p-1}(M \otimes N) \xrightarrow{f'} \pi_{p-1}(M \otimes N).$$

Condition $(*)$ guarantees that f and f' are given by left multiplication by x. It follows that the cokernel of f and the kernel of f' (in the ordinary category of abelian groups) are annihilated by left multiplication by x, so that $\pi_n X$ is annihilated by left multiplication by x^2. □

We now show that if $\phi : A \to B$ is an étalemap of connective $\mathbb{E}_1$-rings, then B is determined by A and $\pi_0 B$. More precisely, we have the following universal property:

Proposition 7.5.1.15. *Let $\phi : A \to B$ be an étalemap of connective $\mathbb{E}_1$-rings and let C be an arbitrary quasi-commutative $\mathbb{E}_1$-ring. Then the diagram σ :*

$$\begin{array}{ccc} \mathrm{Map}_{\mathrm{Alg}^{(1)}}(B, C) & \longrightarrow & \mathrm{Map}_{\mathrm{Alg}^{(1)}}(A, C) \\ \downarrow & & \downarrow \\ \mathrm{Hom}_{\mathrm{Ring}}(\pi_0 B, \pi_0 C) & \longrightarrow & \mathrm{Hom}_{\mathrm{Ring}}(\pi_0 A, \pi_0 C) \end{array}$$

小红书
小红书号:3189205503 qq

is a pullback square in $\mathcal{S}$.

Proof. Since A and B are connective, we may replace C by its connective cover $\tau_{\geq 0}C$ and thereby reduce to the case where C is connective. For every map $C' \to \tau_{\leq 0}C$ in $\mathrm{Alg}^{(1)}$, we let $\sigma_{C'}$ denote the commutative diagram

$$\begin{array}{ccc} \mathrm{Map}_{\mathrm{Alg}^{(1)}}(B, C') & \longrightarrow & \mathrm{Map}_{\mathrm{Alg}^{(1)}}(A, C') \\ \downarrow & & \downarrow \\ \mathrm{Map}_{\mathrm{Alg}^{(1)}}(B, \tau_{\leq 0}C) & \longrightarrow & \mathrm{Map}_{\mathrm{Alg}^{(1)}}(\pi_0 A, \tau_{\leq 0}C). \end{array}$$

Note that σ is equivalent to σ_C; it will therefore suffice to prove that σ_C is a pullback square in $\mathcal{S}$.

The collection of objects C' for which $\sigma_{C'}$ is a pullback square is closed under limits in $\mathrm{Alg}^{(1)}_{/\tau_{\leq 0}C}$. Since C can be realized as the limit of its Postnikov tower

$$\cdots \to \tau_{\leq 2}C \to \tau_{\leq 1}C \to \tau_{\leq 0}C$$

(Proposition 7.1.3.19), we may replace C by $\tau_{\leq n}C$ and thereby reduce to the case where C is n-truncated. We now proceed by induction on n, the case $n = 0$ being trivial. If $n > 0$, then the truncation map $C \to \tau_{\leq n-1}C$ is a square-zero extension (Corollary 7.4.1.28), so we have a pullback diagram

$$\begin{array}{ccc} C & \longrightarrow & \tau_{\leq n-1}C \\ \downarrow & & \downarrow \\ \tau_{\leq n-1}C & \longrightarrow & (\tau_{\leq n-1}C) \oplus (\pi_n C)[n+1]. \end{array}$$

It will therefore suffice to prove that $\sigma_{C'}$ is a pullback diagram, where C' is the trivial square-zero extension of C by $(\pi_n C)[n+1]$. Unwinding the definitions, we are reduced to proving that for any ring homomorphism $\phi : \pi_0 B \to \pi_0 C$, the abelian groups $\mathrm{Ext}^k_{\mathcal{C}}(L_{B/A}, \pi_n C)$ are trivial, where $\mathcal{C}$ denotes the stable ∞-category ${}_B\mathrm{BMod}_B(\mathrm{Sp})$, $L_{B/A} \in \mathcal{C}$ is the relative cotangent complex of B over A, and we regard $\pi_n C$ as a discrete object of $\mathcal{C}$ via the ring homomorphism ϕ.

Proposition 4.6.3.15 furnishes an equivalence of ∞-categories $\mathcal{C} \simeq \mathrm{LMod}_T$, where T denotes the $\mathbb{E}_1$-ring $B^{\mathrm{rev}} \otimes B$. Since the map $\pi_0 A \to \pi_0 B$ is an étalehomomorphism of commutative rings, there exists an idempotent element $e \in \mathrm{Tor}_0^{\pi_0 A}(\pi_0 B, \pi_0 B)$ such that $\mathrm{Tor}_0^{\pi_0 A}(\pi_0 B, \pi_0 B)[\frac{1}{e}] \simeq B$ (Remark 7.5.0.2). The map $\pi_0 T \simeq \mathrm{Tor}_0^{\mathbf{Z}}(\pi_0 B, \pi_0 B) \to \mathrm{Tor}_0^{\pi_0 A}(\pi_0 B, \pi_0 B)$ is surjective, so we can lift e to an element $x \in \pi_0 T$. Since B is connective and quasi-commutative, Lemma 7.5.1.14 guarantees that x is quasi-central.

Using Remark 7.4.1.12, we can identify the relative cotangent complex $L_{B/A}$ with the cofiber of the multiplication map $B \otimes_A B \to B$. Using the flatness of B over A, we obtain an isomorphism

$$\pi_* L_{B/A}[-1] \simeq \mathrm{Tor}_0^{\pi_0 A}(\pi_0 B, \pi_* B)[\frac{1}{1-e}].$$

小红书
小红书号:3189205503 qq

In particular, $\pi_* L_{B/A}$ is annihilated by $x \in \pi_0 T$, so that $L_{B/A}$ is x-nilpotent. Since C is quasi-commutative, the left and right actions of $\pi_0 B$ on $\pi_n C$ (through the chosen homomorphism ϕ) coincide, so that the action of $\pi_0 T$ on $\pi_n C$ factors through the map

$$\pi_0 T \simeq \mathrm{Tor}_0^{\pi_0 R}(\pi_0 B, \pi_0 B) \to \pi_0 B.$$

It follows that $x \in \pi_0 T$ acts by the identity on $\pi_n C$, so that the groups $\mathrm{Ext}^k_{\mathcal{C}}(L_{B/A}, \pi_n C)$ vanish by Proposition 7.2.3.14. □

Proof of Theorem 7.5.1.11. Let A be a connective quasi-commutative $\mathbb{E}_1$-ring; we wish to show that the forgetful functor $\theta : \mathrm{Alg}^{(1),\text{ét}}_{A/} \to \mathrm{N}(\mathrm{Ring}^{\text{ét}}_{\pi_0 A/})$ is an equivalence of ∞-categories. Using Proposition 7.1.3.19, we deduce that $\mathrm{Alg}^{(1),\text{ét}}_{A/}$ is equivalent to the homotopy limit of the tower of ∞-categories

$$\cdots \to \mathrm{Alg}^{(1),\text{ét}}_{\tau_{\leq 2} A/} \to \mathrm{Alg}^{(1),\text{ét}}_{\tau_{\leq 1} A/} \to \mathrm{Alg}^{(1),\text{ét}}_{\tau_{\leq 0} A/} \simeq \mathrm{N}(\mathrm{Ring}^{\text{ét}}_{\pi_0 A/}).$$

We may therefore assume without loss of generality that A is n-truncated. We proceed by induction on n, the case $n = 0$ being trivial. Assume therefore that $n > 0$. Proposition 7.5.1.15 guarantees that θ is fully faithful; it will therefore suffice to show that θ is essentially surjective. Fix an étalemap of commutative rings $\phi_0 : \pi_0 A \to B_0$. Let $A' = \tau_{\leq n-1} A$. Using the inductive hypothesis, we can lift ϕ_0 to an étalemorphism $\phi' : A' \to B'$ of $\mathbb{E}_1$-rings. According to Corollary 7.4.1.28, we conclude that the truncation map $A \to A'$ is a square-zero extension. Let $L_{A'}$ denote the cotangent complex of A (as an $\mathbb{E}_1$-ring), and write $A = A'^{\eta}$ for some derivation $\eta : L_{A'} \to M[n+1]$, where $M \in {}_{A'}\mathrm{BMod}_{A'}(\mathrm{Sp})$ corresponds to the discrete $(\pi_0 A)$-$(\pi_0 A)$-bimodule given by $\pi_n A$. Since A is quasi-commutative, the left and right actions of $\pi_0 A$ on M agree.

Let N denote the abelian group $B_0 \otimes_{\pi_0 A} \pi_n A$. We can regard N as a bimodule over B_0, where the left and right actions of B_0 on N agree. We may thereby identify N with a discrete object of ${}_{B'}\mathrm{BMod}_{B'}(\mathrm{LMod}_R)$. The map of A'-A'-bimodules $L_{A'} \xrightarrow{\eta} M[n+1] \to N[n+1]$ induced a map of B'-B'-bimodules $\eta' : B' \otimes_{A'} L_{A'} \otimes_{A'} B' \to N[n+1]$. Consider the cofiber diagram

$$B' \otimes_{A'} L_{A'} \otimes_{A'} B' \to L_{B'} \to L_{B'/A'}.$$

Write ${}_{B'}\mathrm{BMod}_{B'}(\mathrm{Sp}) \simeq \mathrm{LMod}_T$ and choose $x \in \pi_0 T$ as in the proof of Proposition 7.5.1.15, so that x is quasi-central and $L_{B'/A'}$ is x-nilpotent. Since the left and right actions of $\pi_0 B$ on N coincide, multiplication by x is homotopic to the identity on N. Using Proposition 7.2.3.14, we deduce that the groups $\mathrm{Ext}^i_T(L_{B'/A'}, N)$ are trivial. It follows that the map η' factors as a composition

$$B' \otimes_{A'} L_{A'} \otimes_{A'} B' \to L_{B'} \xrightarrow{\gamma} N.$$

The induced map $A \simeq A'^{\eta} \to B'^{\gamma}$ is an object $\mathrm{Alg}^{(1),\text{ét}}_{A/}$ whose image in $\mathrm{N}(\mathrm{Ring}^{\text{ét}}_{\pi_0 A/})$ is isomorphic to the original ring homomorphism $\phi : \pi_0 A \to B_0$. □

For later use, we record the following hybrid of Theorem 7.5.1.11 and Proposition 7.5.1.15.

小红书
小红书号:3189205503 qq

Theorem 7.5.1.16. *Let $\psi : A \to C$ be a map of connective, quasi-commutative $\mathbb{E}_1$-rings. Then the construction $B \mapsto \pi_0 B$ induces an equivalence of ∞-categories*

$$\mathrm{Alg}^{(1),ét}_{A//C} \to \mathrm{N}(\mathrm{Ring}^{ét}_{\pi_0 A//\pi_0 C}).$$

Proof. We have a commutative diagram of ∞-categories

$$\begin{array}{ccc} \mathrm{Alg}^{(1),\text{ét}}_{A//C} & \longrightarrow & \mathrm{N}(\mathrm{Ring}^{\text{ét}}_{\pi_0 A//\pi_0 C}) \\ \downarrow{\scriptstyle p} & & \downarrow{\scriptstyle q} \\ \mathrm{Alg}^{(1),\text{ét}}_{A/} & \longrightarrow & \mathrm{N}(\mathrm{Ring}^{\text{ét}}_{\pi_0 A/}). \end{array}$$

The vertical maps are right fibrations, and the bottom horizontal map is an equivalence of ∞-categories (Proposition 7.5.1.11). It therefore suffices to show that for every étalemap $A \to A'$, the functor θ induces a homotopy equivalence from the fiber of p over A' to the fiber of q over $\pi_0 A'$ (Corollary HTT.2.4.4.4). This follows immediately from Proposition 7.5.1.15. □

7.5.2 The Nonconnective Case

Let A be a quasi-commutative $\mathbb{E}_1$-ring, and suppose we are given an étalehomomorphism $\phi_0 : \pi_0 A \to B_0$ of commutative rings. In §7.5.1, we showed that when A is connective, there is an essentially unique way to lift ϕ_0 to an étalemap $\phi : A \to B$ of quasi-commutative $\mathbb{E}_1$-rings (Theorem 7.5.1.11). Our goal in this section is to extend this result to the case where A is not assumed to be connective.

We begin by outlining our strategy. Let A be as above, and let $\tau_{\geq 0} A$ be its connective cover. Using Theorem 7.5.1.11, we deduce that ϕ_0 can be lifted to an étalemap of connective $\mathbb{E}_1$-rings $\tau_{\geq 0} A \to B'$. In particular, B' is flat over $\tau_{\geq 0} A$. The tensor product $B = A \otimes_{\tau_{\geq 0} A} B'$ is a flat A-module, which is equipped with a canonical isomorphism $\pi_0 B \simeq \pi_0 B' \simeq B_0$. It is not obvious that B is an $\mathbb{E}_1$-ring: a relative tensor product of associative ring spectra does not generally inherit a ring structure. We will show that B admits an $\mathbb{E}_1$-structure by exploiting the quasi-commutativity of A. Before giving the details, we need to embark on a bit of a digression.

Definition 7.5.2.1. Let R be an associative ring, and let M be a (discrete) R-R-bimodule. For every element $x \in R$, let $l_x, r_x : M \to M$ be the endomorphisms given by left and right multiplication by x, respectively. We will say that M is *x-balanced* if the difference $l_x - r_x$ is locally nilpotent: that is, for each $y \in M$, we have $(l_x - r_x)^n(y) = 0$ for $n \gg 0$. We say that M is *balanced* if it is x-balanced for each $x \in R$.

Remark 7.5.2.2. Let R and M be as in Definition 7.5.2.1. Suppose that R is commutative, and let X denote the affine scheme given by the spectrum of R and identify M with a quasi-coherent sheaf on the product $X \times X$. Then M is balanced if and only if the restriction of M to the open set $X \times X - \Delta$ is zero, where $\Delta \subseteq X \times X$ denotes the image of the diagonal map $X \to X \times X$.

小红书
小红书号:3189205503 qq

Remark 7.5.2.3. Let R be an associative ring, and let ${}_R\mathrm{BMod}_R(\mathcal{A}b)$ denote the abelian category of (discrete) R-R-bimodules. For each $x \in R$, let $\mathcal{C} \subseteq {}_R\mathrm{BMod}_R(\mathcal{A}b)$ be the full subcategory spanned by the x-balanced bimodules. Then $\mathcal{C}_x$ is an abelian subcategory of ${}_R\mathrm{BMod}_R(\mathcal{A}b)$, which is closed under colimits, extensions, and the formation of subobjects and quotient objects. It follows that the category $\bigcup_{x \in R} \mathcal{C}_x$ of balanced bimodules is also an abelian subcategory of ${}_R\mathrm{BMod}_R(\mathcal{A}b)$, closed under extensions, small colimits, passage to subobjects, and passage to quotient objects.

Remark 7.5.2.4. Let R be an associative ring and let x be an element of the center of R. For every right R-module M, multiplication by x defines an R-module endomorphism $M \xrightarrow{x} M$. Similarly, if N is a left R-module, then multiplication by x determines an A-linear map $N \xrightarrow{x} N$. For each $n \geq 0$, these endomorphisms induce the same map from $\mathrm{Tor}_n^R(M, N)$ to itself.

Suppose we are given associative rings A, B, and C. Let M be a discrete A-B-bimodule and let N a discrete B-C-bimodule. Then the relative tensor product $M \otimes_B N$ is an A-C-bimodule spectrum, with homotopy groups given by $\pi_n(M \otimes_B N) = \mathrm{Tor}_n^B(M, N)$. In particular, taking $A = B = C$, we see that if M and N are A-A-bimodules, then each of the abelian groups $\mathrm{Tor}_n^A(M, N)$ has the structure of an A-A-bimodule.

Lemma 7.5.2.5. *Let R be an associative ring, let x be an element of the center of A, and let M and N be discrete R-R-bimodules. If M and N are x-balanced, then $\mathrm{Tor}_n^R(M, N)$ is x-balanced.*

Proof. Let $l_x, r_x : M \to M$ be the maps given by left multiplication and right multiplication by x, respectively. For each integer $k \geq 0$, let M_k denote the kernel of $(l_x - r_x)^k$. Since x is central, M_k is an R-R submodule of M. Our assumption that M is x-balance implies that $M = \bigcup_k M_k$, so that $\mathrm{Tor}_n^R(M, N) \simeq \varinjlim \mathrm{Tor}_n^R(M_k, N)$. Since the collection of x-balanced submodules is closed under colimits, it will suffice to show that each $\mathrm{Tor}_n^R(M_k, N)$ is x-balanced. We proceed by induction on k. Using the exact sequences

$$\mathrm{Tor}_n^R(M_k, N) \to \mathrm{Tor}_n^R(M_{k+1}, N) \to \mathrm{Tor}_n^R(M_{k+1}/M_k, N),$$

we are reduced to proving that each of the bimodules $\mathrm{Tor}_n^R(M_{k+1}/M_k, N)$ is x-balanced. We may therefore replace M by M_{k+1}/M_k, and thereby reduce to the case where left and right multiplication by x induce the same map from M to itself. By the same argument, we can assume that left and right multiplication by x induce the same map from N to itself. In this case, Remark 7.5.2.4 immediately implies that left and right multiplication by x induce the same map from $\mathrm{Tor}_n^R(M, N)$ to itself, from which it follows immediately that $\mathrm{Tor}_n^R(M, N)$ is x-balanced. □

Definition 7.5.2.6. Let A be a quasi-commutative $\mathbb{E}_1$-ring, and let $M \in {}_A\mathrm{BMod}_A(\mathrm{Sp})$. Let $x \in \pi_0 A$. We will say that M is *x-balanced* if every homotopy group $\pi_n M$ is x-balanced, in the sense of Definition 7.5.2.1. We will say that M is *balanced* if it is x-balanced, for each $x \in \pi_0 A$.

小红书
小红书号:3189205503 qq

Remark 7.5.2.7. Let A be a quasi-commutative $\mathbb{E}_1$-ring, and let M be a discrete A-A-bimodule. Then M is balanced (x-balanced) in the sense of Definition 7.5.2.6 if and only if it is balanced (x-balanced) in the sense of Definition 7.5.2.1, when viewed as a bimodule over the commutative ring $\pi_0 A$.

Notation 7.5.2.8. Let A be a quasi-commutative $\mathbb{E}_1$-ring. We let ${}_A\mathrm{BMod}_A^{\mathrm{bal}}(\mathrm{Sp})$ denote the full subcategory of ${}_A\mathrm{BMod}_A(\mathrm{Sp})$ spanned by the balanced A-A-bimodules. It follows immediately from Remark 7.5.2.3 that ${}_A\mathrm{BMod}_A^{\mathrm{bal}}(\mathrm{Sp})$ is a stable subcategory of ${}_A\mathrm{BMod}_A(\mathrm{Sp})$, which is closed under small colimits.

Proposition 7.5.2.9. *Let A be a connective, quasi-commutative $\mathbb{E}_1$-ring. Then the full subcategory*

$$ {}_A\mathrm{BMod}_A^{\mathrm{bal}}(\mathrm{Sp}) \subseteq {}_A\mathrm{BMod}_A(\mathrm{Sp}) $$

contains A and is closed under the relative tensor product $\otimes_A$.

Proof. Since A is quasi-commutative, it is obvious that the unit object $A \in {}_A\mathrm{BMod}_A(\mathrm{Sp})$ is balanced. Suppose that $M, N \in {}_A\mathrm{BMod}_A(\mathrm{Sp})$ are balanced; we wish to show that $M \otimes_A N$ is also balanced. Fix $x \in \pi_0 A$; we will show that $M \otimes_A N$ is x-balanced. According to Proposition 7.2.1.19, there exists a spectral sequence $\{E_r^{p,q}, d_r\}_{r \geq 1}$ converging to $\pi_{p+q}(M \otimes_A N)$, with $E_2^{p,q} = \mathrm{Tor}_p^{\pi_* A}(\pi_* M, \pi_* N)_q$. Using the functoriality of the construction of this spectral sequence, we see that it is a spectral sequence of bimodules over the graded ring $\pi_* A$. It follows that $\pi_*(M \otimes_A N)$ admits an exhaustive filtration by bimodules over $\pi_* A$, and that the associated graded objects for this filtration are given by subquotients of bimodules of the form $\mathrm{Tor}_p^{\pi_* A}(\pi_* M, \pi_* N)$. Using Remark 7.5.2.3, we are reduced to showing that each of the $(\pi_* A)$-bimodules $\mathrm{Tor}_p^{\pi_* A}(\pi_* M, \pi_* N)$ is x-balanced, which follows from Lemma 7.5.2.5. □

Lemma 7.5.2.10. *Let $\phi : A \to B$ be an étalehomomorphism of commutative rings, and choose an element $\overline{e} \in \mathrm{Tor}_0^{\mathbf{Z}}(B, B)$ whose image $e \in R = \mathrm{Tor}_0^A(B, B)$ is an idempotent satisfying $\mathrm{Tor}_0^A(B, B)[e^{-1}] \simeq B$ (see Remark 7.5.0.2). Let M be a (discete) B-B-bimodule. Then M is balanced as a B-B-bimodule if and only if the following conditions are satisfied:*

(1) *As an A-A-bimodule, M is balanced.*

(2) *The canonical map $M \to M[\overline{e}^{-1}]$ is an isomorphism.*

Proof. Assume first that M is balanced as a B-B-bimodule. Condition (1) is obvious. To verify (2), write A as a union of finitely generated subrings A_α. The structure theory of étalemorphisms of commutative rings implies that there exists an index α and an étalehomomorphism $A_\alpha \to B_\alpha$ such that $B \simeq \mathrm{Tor}_0^{A_\alpha}(A, B_\alpha)$. Enlarging A_α if necessary, we may assume that $\overline{e}$ is the image of an element $\overline{e}' \in \mathrm{Tor}_0^{\mathbf{Z}}(B_\alpha, B_\alpha)$ whose image $e' \in \mathrm{Tor}_0^{A_\alpha}(B_\alpha, B_\alpha)$ satisfies $\mathrm{Tor}_0^{A_\alpha}(B_\alpha, B_\alpha)[e'^{-1}] \simeq B_\alpha$. Replacing A by A_α, B by B_α, and $\overline{e}$ by $\overline{e}'$, we may assume that the commutative ring A is finitely generated over $\mathbf{Z}$.

小红书
小红书号:3189205503 qq

Let I be the kernel of the multiplication map $m : \mathrm{Tor}_0^{\mathbf{Z}}(B,B) \to B$. Since B is a finitely generated commutative ring, $\mathrm{Tor}_0^{\mathbf{Z}}(B,B)$ also a finitely generated commutative ring and therefore Noetherian, so the ideal I is finitely generated. Since M is balanced as a B-B-bimodule, every element of I has a locally nilpotent action on M. It follows that every element $x \in M$ is annihilated by some power of I. For each $k \geq 0$, let M_k denote the submodule of M which is annihilated by I^k. Then $M = \bigcup_k M_k$. Consequently, to prove (b), it suffices to show that each of the maps $M_k \to M_k[\overline{e}^{-1}]$ is an isomorphism. We proceed by induction on k, the case $k = 0$ being obvious. To handle the inductive step, we observe that there is a commutative diagram with exact rows

$$\begin{array}{ccccccccc} 0 & \longrightarrow & M_k & \longrightarrow & M_{k+1} & \longrightarrow & M_{k+1}/M_k & \longrightarrow & 0 \\ & & \downarrow & & \downarrow & & \downarrow{\scriptstyle \psi} & & \\ 0 & \longrightarrow & M_k[\overline{e}^{-1}] & \longrightarrow & M_{k+1}[\overline{e}^{-1}] & \longrightarrow & (M_{k+1}/M_k)[\overline{e}^{-1}] & \longrightarrow & 0. \end{array}$$

Using the inductive hypothesis and the snake lemma, we are reduced to proving that the map ψ is an isomorphism. We may therefore replace M by M_{k+1}/M_k, and thereby reduce to the case where the action of $\mathrm{Tor}_0^{\mathbf{Z}}(B,B)$ on M factors through $\mathrm{Tor}_0^{\mathbf{Z}}(B,B)/I \simeq B$. The desired result now follows from the observation that $m(\overline{e}) = 1$.

Now suppose that (1) and (2) are satisfied; we wish to prove that M is balanced as a B-B-bimodule. Choose $x \in B$; we will show that M is x-balanced. Arguing as above, we can reduce to the case where A is a finitely generated commutative ring. Let $m' : \mathrm{Tor}_0^{\mathbf{Z}}(A,A) \to A$ be the multiplication map and let J be the kernel of m'. Since $\mathrm{Tor}_0^{\mathbf{Z}}(A,A)$ is a finitely generated commutative ring, it is Noetherian. It follows that J is finitely generated. Since M is balanced as an A-A-bimodule, the action of J on M is locally nilpotent. We may therefore write $M = \bigcup_{k \geq 0} M'_k$, where M'_k denotes the submodule of M which is annihilated by J^k. Since the collection of x-balanced bimodules is closed under filtered colimits, it will suffice to show that each M'_k is x-balanced. We proceed by induction on k. Since the collection of x-balanced bimodules is closed under extensions, we are reduced to proving that each quotient M'_{k+1}/M'_k is x-balanced. Replacing M by M'_{k+1}/M'_k, we may reduce to the case where $JM = 0$: that is, the left and right actions of A on M coincide. It follows that we may regard M as a module over the ring $\mathrm{Tor}_0^A(B,B)$. Using condition (2), we see that $e \in \mathrm{Tor}_0^A(B,B)$ acts invertibly on M: that is, the action of $\mathrm{Tor}_0^{\mathbf{Z}}(B,B)$ on M factors through the map $\mathrm{Tor}_0^{\mathbf{Z}}(B,B) \to \mathrm{Tor}_0^A(B,B)[e^{-1}] \simeq B$, so that the left and right actions of B on M coincide. In this case, it is obvious that M is x-balanced. □

Remark 7.5.2.11. In the situation of Lemma 7.5.2.10, suppose that M satisfies condition (2) and that the left and right actions of A on M coincide. The proof of Lemma 7.5.2.10 shows that the left and right actions of B on M coincide.

Notation 7.5.2.12. Let B be a connective $\mathbb{E}_1$-ring and let $M \in {}_B\mathrm{BMod}_B(\mathcal{C})$, so that we can identify M with a left module over the $\mathbb{E}_1$-ring $B \otimes B^{\mathrm{rev}}$ (see Proposition 4.6.3.15). Suppose that

小红书
小红书号:3189205503 qq

$e \in \pi_0(B \otimes B^{\mathrm{rev}}) \simeq \mathrm{Tor}_0^{\mathbf{Z}}(\pi_0 B, \pi_0 B)$ is quasi-central: that is, the set $S = \{e^n\}_{n \geq 0} \subseteq \pi_0(B \otimes B^{\mathrm{rev}})$ satisfies the left Ore condition. We will denote the localization $M[S^{-1}]$ by $M[e^{-1}]$, and we will say that M is *e-local* if the unit map $M \to M[e^{-1}]$ is an equivalence.

In the situation of Notation 7.5.2.12, if B is quasi-commutative, then every element of $\pi_0(B \otimes B^{\mathrm{rev}})$ is quasi-central (Lemma 7.5.1.14). We immediately deduce the following generalization of Lemma 7.5.2.10.

Lemma 7.5.2.13. *Let $\phi : A \to B$ be an étalemap of connective, quasi-commutative $\mathbb{E}_1$-rings, and let $M \in {}_B\mathrm{BMod}_B(\mathrm{Sp})$. Then M is balanced as a B-B-bimodule if and only if it is balanced as an A-A-bimodule and $\overline{e}$-local, where $\overline{e} \in \mathrm{Tor}_0^{\mathbf{Z}}(\pi_0 B, \pi_0 B)$ is chosen as in Lemma 7.5.2.10.*

Our next goal is to describe a "base-change" functor for balanced bimodules along an étalemorphism.

Lemma 7.5.2.14. *Let $\phi : A \to B$ be an étalehomomorphism of commutative rings and let $\overline{e}$ be as in Lemma 7.5.2.10. Let M be a balanced A-A-bimodule. Then the canonical map*

$$\theta_M : B \otimes_A M \to (B \otimes_A M \otimes_A B)[\overline{e}^{-1}]$$

is an isomorphism of left B-modules.

Proof. Arguing as in the proof of Lemma 7.5.2.10, we reduce to the case in which A is a finitely generated commutative ring. Let I denote the kernel of the multiplication map $\mathrm{Tor}_0^{\mathbf{Z}}(A, A) \to A$. Then I is a finitely generated ideal. Since every element of I has a locally nilpotent action on M, we conclude that $M = \bigcup_{k \geq 0} M_k$, where M_k denotes the submodule of M annihilated by I^k. It will therefore suffice to show that each of the maps θ_{M_k} is an isomorphism. We proceed by induction on k, the case $k = 0$ being trivial. To handle the inductive step, we use the short exact sequence

$$0 \to M_k \to M_{k+1} \to M_{k+1}/M_k \to 0$$

to reduce to the problem of showing that θ_{M_{k+1}/M_k} is an isomorphism. Replacing M by M_{k+1}/M_k, we reduce to the case where $IM = 0$: that is, the left and right actions of A on M are the same. In this case, we can identify θ_M with a map

$$B \otimes_A M \to \mathrm{Tor}_0^A(B, B)[e^{-1}] \otimes_A M.$$

This map is an isomorphism, since $\overline{e}$ was chosen so that $\mathrm{Tor}_0^A(B, B)[e^{-1}] \simeq B$. □

Lemma 7.5.2.15. *Let $\phi : A \to B$ be an étalemap between connective quasi-commutative $\mathbb{E}_1$-rings. Then the forgetful functor ${}_B\mathrm{BMod}_B^{\mathrm{bal}}(\mathrm{Sp}) \to {}_A\mathrm{BMod}_A^{\mathrm{bal}}(\mathrm{Sp})$ admits a left adjoint $F : {}_A\mathrm{BMod}_A^{\mathrm{bal}}(\mathrm{Sp}) \to {}_B\mathrm{BMod}_B^{\mathrm{bal}}(\mathrm{Sp})$. Moreover, for every object $M \in {}_A\mathrm{BMod}_A^{\mathrm{bal}}(\mathrm{Sp})$, the composite map*

$$B \otimes_A M \to B \otimes_A M \otimes_A B \to F(M)$$

is an equivalence of left B-modules.

小红书
小红书号:3189205503 qq

Proof. Let $\overline{e} \in \pi_0(B \otimes B^{\mathrm{rev}}) \simeq \mathrm{Tor}_0^{\mathbf{Z}}(\pi_0 B, \pi_0 B)$ be as in Lemma 7.5.2.10. Using Lemma 7.5.2.13, we deduce that the functor F exists and is given on objects by the formula $F(M) = (B \otimes_A M \otimes_A B)[\overline{e}^{-1}]$. The last assertion follows from Lemma 7.5.2.14. □

In the situation of Lemma 7.5.2.15, let us regard ${}_B\mathrm{BMod}_B^{\mathrm{bal}}(\mathrm{Sp})$ and ${}_A\mathrm{BMod}_A^{\mathrm{bal}}(\mathrm{Sp})$ as monoidal ∞-categories, so that the forgetful functor $G : {}_B\mathrm{BMod}_B^{\mathrm{bal}}(\mathrm{Sp}) \to {}_A\mathrm{BMod}_A^{\mathrm{bal}}(\mathrm{Sp})$ is lax monoidal. We therefore obtain a canonical map $F(M \otimes_A N) \to F(M) \otimes_B F(N)$ for every pair of objects $M, N \in {}_A\mathrm{BMod}_A^{\mathrm{bal}}(\mathrm{Sp})$. We claim that this map is an equivalence. To prove this, it will suffice (by Lemma 7.5.2.15) to show that the composite map

$$B \otimes_A (M \otimes_A N) \to F(M \otimes_A N) \to F(M) \otimes_B F(N)$$

is an equivalence. This map factors as a composition

$$B \otimes_A M \otimes_A N \xrightarrow{\psi} F(M) \otimes_A N \xrightarrow{\psi'} F(M) \otimes_B F(N),$$

where ψ and ψ' are equivalences by Lemma 7.5.2.15. A similar argument shows that the canonical map $F(A) \to B$ is an equivalence. Using Corollary 7.3.2.12, we deduce that F can be regarded as a monoidal functor from ${}_A\mathrm{BMod}_A^{\mathrm{bal}}(\mathrm{Sp})$ to ${}_B\mathrm{BMod}_B^{\mathrm{bal}}(\mathrm{Sp})$, and Remark 7.3.2.13 implies that composition with F induces a functor

$$\mathrm{Alg}({}_A\mathrm{BMod}_A^{\mathrm{bal}}(\mathrm{Sp})) \to \mathrm{Alg}({}_B\mathrm{BMod}_B^{\mathrm{bal}}(\mathrm{Sp}))$$

which is left adjoint to the forgetful functor. Combining this observation with Corollary 3.4.1.7, we obtain the following result:

Proposition 7.5.2.16. *Let $\phi : A \to B$ be an étalemorphism between connective, quasi-commutative $\mathbb{E}_1$-rings. Let $\mathrm{Alg}^{(1),\mathrm{bal}}_{A/}$ denote the full subcategory of $\mathrm{Alg}^{(1)}_{A/}$ spanned by those morphisms of $\mathbb{E}_1$-rings $\psi : A \to A'$ which exhibit A' as a balanced A-A-bimodule, and let $\mathrm{Alg}^{(1),\mathrm{bal}}_{B/}$ be defined similarly. Then the forgetful functor $\mathrm{Alg}^{(1),\mathrm{bal}}_{B/} \to \mathrm{Alg}^{(1),\mathrm{bal}}_{A/}$ admits a left adjoint F. Moreover, for every $A' \in \mathrm{Alg}^{(1),\mathrm{bal}}_{A/}$, the canonical map $B \otimes_A A' \to F(A')$ is an equivalence of left B-modules.*

Remark 7.5.2.17. In the situation of Proposition 7.5.2.16, the map $\phi : A \to B$ exhibits B as a flat right module over A. It follows from Proposition 7.2.2.13 that for every $A' \in \mathrm{Alg}^{(1),\mathrm{bal}}_{A/}$, the canonical map $\mathrm{Tor}_0^{\pi_0 A}(\pi_0 B, \pi_n A') \to \pi_n F(A')$ is an isomorphism for every integer n. It follows that $F(A')$ is flat as a right A'-module. If we assume in addition that A' is quasi-commutative and the natural map $\pi_0 A \to \pi_0 A'$ is an isomorphism, then we obtain an isomorphism $\pi_0 B \to \pi_0 F(A')$, and Remark 7.5.2.11 shows that the left and right actions of $\pi_0 F(A')$ on $\pi_n F(A')$ coincide for each n. It follows that $F(A')$ is quasi-commutative and that the map $A' \to F(A')$ is an étalemorphism of $\mathbb{E}_1$-rings.

小红书
小红书号:3189205503 qq

Proposition 7.5.2.18. *Let A be a quasi-commutative $\mathbb{E}_1$-ring. Suppose we are given an étalemorphism of commutative rings $\phi_0 : \pi_0 A \to B_0$. Then there exists a map of $\mathbb{E}_1$-rings $\phi : A \to B$ with the following properties:*

(1) *The map ϕ is étale(in particular, B is quasi-commutative).*

(2) *There is an isomorphism of commutative rings $\pi_0 B \simeq B_0$ such that ϕ induces the map $\phi_0 : \pi_0 A \to B_0$.*

(3) *For every quasi-commutative $\mathbb{E}_1$-ring C, the canonical map*

$$\mathrm{Map}_{\mathrm{Alg}^{(1)}}(B, C) \to \mathrm{Map}_{\mathrm{Alg}^{(1)}}(A, C) \times_{\mathrm{Hom}_{\mathrm{Ring}}(\pi_0 A, \pi_0 C)} \mathrm{Hom}_{\mathrm{Ring}}(\pi_0 B, \pi_0 C).$$

Proof. Let A' be a connective cover of A. Using Theorem 7.5.1.11, we can choose an étalemap of connective $\mathbb{E}_1$-rings $\phi' : A' \to B'$ and an isomorphism $\pi_0 B' \simeq B_0$. Let $F : \mathrm{Alg}^{(1),\mathrm{bal}}_{A'/} \to \mathrm{Alg}^{(1),\mathrm{bal}}_{B'/}$ be as in Proposition 7.5.2.16, and set $B = F(A)$. We have a commutative diagram of $\mathbb{E}_1$-rings

$$\begin{array}{ccc} A' & \xrightarrow{\phi'} & B' \\ \downarrow & & \downarrow \\ A & \xrightarrow{\phi} & B. \end{array}$$

It follows from Remark 7.5.2.17 that ϕ is étaleand that $\pi_0 B \simeq \pi_0 B' \simeq B_0$. Using the definition of F, we note that for every map of $\mathbb{E}_1$-rings $A \to C$ which exhibits C as a balanced bimodule over A, we have $\mathrm{Map}_{\mathrm{Alg}^{(1)}_{A/}}(B, C) \simeq \mathrm{Map}_{\mathrm{Alg}^{(1)}_{A'/}}(B', C)$. If C is quasi-commutative, then it is automatically balanced as a bimodule, so that upper square in the diagram

$$\begin{array}{ccc} \mathrm{Map}_{\mathrm{Alg}^{(1)}}(B, C) & \longrightarrow & \mathrm{Map}_{\mathrm{Alg}^{(1)}}(A, C) \\ \downarrow & & \downarrow \\ \mathrm{Map}_{\mathrm{Alg}^{(1)}}(B', C) & \longrightarrow & \mathrm{Map}_{\mathrm{Alg}^{(1)}}(A', C) \\ \downarrow & & \downarrow \\ \mathrm{Hom}_{\mathrm{Ring}}(B_0, \pi_0 C) & \longrightarrow & \mathrm{Hom}_{\mathrm{Ring}}(\pi_0 A, \pi_0 C) \end{array}$$

is a pullback square. The lower square is pullback by Proposition 7.5.1.15, so that the outer rectangle is also a pullback diagram. □

Corollary 7.5.2.19. *Let $\phi : A \to B$ be an étalemorphism between quasi-commutative $\mathbb{E}_1$-rings. Then, for every quasi-commutative $\mathbb{E}_1$-ring C, the canonical map*

$$\mathrm{Map}_{\mathrm{Alg}^{(1)}}(B, C) \to \mathrm{Map}_{\mathrm{Alg}^{(1)}}(A, C) \times_{\mathrm{Hom}_{\mathrm{Ring}}(\pi_0 A, \pi_0 C)} \mathrm{Hom}_{\mathrm{Ring}}(\pi_0 B, \pi_0 C)$$

is a homotopy equivalence.

小红书
小红书号:3189205503 qq

Proof. Let $B_0 = \pi_0 B$ and let $\phi_0 : \pi_0 A \to B_0$ be the étalemap of commutative rings induced by ϕ. Choose an étalemorphism $\phi' : A \to B'$ satisfying the conclusions of Proposition 7.5.2.18. In particular, we see that the map $\phi : A \to B$ factors as a composition

$$A \xrightarrow{\phi'} B' \xrightarrow{\psi} B,$$

where ψ induces the identity map $\pi_0 B' \to \pi_0 B$. Since B' and B are both flat over A, we deduce that for every integer n the map

$$\pi_n B' \simeq \mathrm{Tor}_0^{\pi_0 A}(\pi_n A, \pi_0 B') \to \mathrm{Tor}_0^{\pi_0 A}(\pi_n A, \pi_0 B) \simeq \pi_n B$$

is an isomorphism. It follows that ψ is an equivalence, so that $\phi : A \to B$ also satisfies the conclusions of Proposition 7.5.2.18. □

We are now ready to prove a non-connective version of Theorem 7.5.1.16.

Theorem 7.5.2.20. *Let $\psi : A \to C$ be a map of quasi-commutative $\mathbb{E}_1$-rings. Then the construction $B \mapsto \pi_0 B$ induces an equivalence of ∞-categories*

$$\theta : \mathrm{Alg}^{(1),ét}_{A//C} \to \mathrm{N}(\mathrm{Ring}^{ét}_{\pi_0 A//\pi_0 C}).$$

Proof. We have a commutative diagram of ∞-categories

$$\begin{array}{ccc} \mathrm{Alg}^{(1),\text{ét}}_{A//C} & \longrightarrow & \mathrm{N}(\mathrm{Ring}^{\text{ét}}_{\pi_0 A//\pi_0 C}) \\ \downarrow{\scriptstyle p} & & \downarrow{\scriptstyle q} \\ \mathrm{Alg}^{(1),\text{ét}}_{A/} & \xrightarrow{\theta'} & \mathrm{N}(\mathrm{Ring}^{\text{ét}}_{\pi_0 A/}). \end{array}$$

The vertical maps are right fibrations. The map θ' is essentially surjective by Proposition 7.5.2.18, and fully faithful by Corollary 7.5.2.19. It follows that θ' is an equivalence of ∞-categories. It therefore suffices to show that for every étalemap $A \to B$, the functor θ induces a homotopy equivalence from the fiber of p over B to the fiber of q over $\pi_0 B$ (Corollary HTT.2.4.4.4). This follows immediately from Corollary 7.5.2.19. □

7.5.3 Cocentric Morphisms

For every associative ring A, let $\mathfrak{Z}(A)$ denote the center of A. The construction $A \mapsto \mathfrak{Z}(A)$ is not functorial: if $\phi : A \to B$ is a morphism of commutative rings, then ϕ does not generally carry $\mathfrak{Z}(A)$ into $\mathfrak{Z}(B)$. However, we can guarantee that $\phi(\mathfrak{Z}(A)) \subseteq \mathfrak{Z}(B)$ if we are willing to assume that ϕ satisfies the following condition:

(∗) The inclusion $\mathfrak{Z}(B) \subseteq \mathfrak{Z}(\phi)$ is a bijection. In other words, an element $b \in B$ is central if and only if $b\phi(a) = \phi(a)b$ for all $a \in A$.

小红书
小红书号:3189205503 qq

Condition $(*)$ has the virtue of being phrased in terms of centralizers, and can therefore be generalized to an arbitrary monoidal ∞-category.

Definition 7.5.3.1. Let $\mathcal{C}$ be a monoidal ∞-category, let $\mathcal{M}$ be an ∞-category which is left-tensored over $\mathcal{M}$, and suppose we are given morphisms $A \xrightarrow{\phi} B \xrightarrow{\psi} C$ in $\mathcal{M}$. We will say that ϕ is *cocentric relative to* ψ if the following conditions are satisfied:

(i) There exists a centralizer $\mathfrak{Z}(\psi)$ of ψ.

(ii) The composite map

$$\mathfrak{Z}(\psi) \otimes A \xrightarrow{\mathrm{id} \otimes \phi} \mathfrak{Z}(\psi) \otimes B \longrightarrow C$$

exhibits $\mathfrak{Z}(\psi)$ as a centralizer of $\psi \circ \phi$.

We will say that a morphism $\phi : A \to B$ in $\mathcal{M}$ is *cocentric* if it is cocentric relative to id_B.

Example 7.5.3.2. Let $\mathcal{C}$ be the nerve of the category of associative rings. Regard $\mathcal{C}$ as a monoidal ∞-category via the usual tensor product of rings. A ring homomorphism $\phi : A \to B$ in $\mathcal{C}$ is cocentric if and only if it satisfies condition $(*)$ above.

Example 7.5.3.3. In [45], the authors define a *centric* map of spaces to be a map $f : X \to Y$ which induces a homotopy equivalence $\mathrm{Map}_{\mathcal{S}}(X, X)_{\mathrm{id}_X} \to \mathrm{Map}_{\mathcal{S}}(X, Y)_f$. Here $\mathrm{Map}_{\mathcal{S}}(X, X)_{\mathrm{id}_X}$ denote the connected component of $\mathrm{Map}_{\mathcal{S}}(X, X)$ containing id_X, and $\mathrm{Map}_{\mathcal{S}}(X, Y)_f$ is defined similarly. Let $\mathcal{S}_{\geq 1}$ be the full subcategory of $\mathcal{S}$ spanned by the connected spaces, which we regard as endowed with the Cartesian monoidal structure, and regard $\mathcal{S}$ as left-tensored over $\mathcal{S}_{\geq 1}$ (via the Cartesian product). For every map of spaces $f : X \to Y$, the space $\mathrm{Map}_{\mathcal{S}}(X, Y)_f$ can be identified with the centralizer of f in $\mathcal{S}_{\geq 1}$. Consequently, f is centric if and only if it induces a homotopy equivalence $\mathfrak{Z}(\mathrm{id}_X) \to \mathfrak{Z}(f)$. This is precisely *dual* to the requirement of Definition 7.5.3.1.

In this section, we will develop the theory of cocentric morphisms and apply it to obtain a relative version of Theorem 7.5.2.20. Our first main result is that if $\phi : A \to B$ is a cocentric morphism, the ϕ induces a map from the center of A (provided that it exists) to the center of B.

Proposition 7.5.3.4. *Let $\mathcal{C}$ be a monoidal ∞-category containing an algebra object $R \in \mathrm{Alg}(\mathcal{C})$, let $\mathcal{M}$ be an ∞-category left-tensored over $\mathcal{C}$. Suppose we are given a diagram*

$$\begin{array}{ccc} \Lambda^n_0 & \xrightarrow{U_0} & \mathrm{LMod}_R(\mathcal{M}) \\ \downarrow & \overset{U}{\nearrow} & \downarrow \\ \Delta^n & \xrightarrow{V} & \mathcal{M} \end{array}$$

for some integer $n > 0$. Let $A = V(0)$, $B = V(1)$, and $C = V(n)$, so that V induces morphisms $A \xrightarrow{\phi} B \xrightarrow{\psi} C$ in $\mathcal{M}$. If ϕ is cocentric relative to ψ, then there exists a dotted arrow U as indicated, rendering the diagram commutative.

小红书
小红书号:3189205503 qq

We will give the proof of Proposition 7.5.3.4 at the end of this section.

Remark 7.5.3.5. In the case $n = 1$, Proposition 7.5.3.4 asserts that if $\phi : A \to B$ is a cocentric morphism and A admits a left action of an algebra object $R \in \mathrm{Alg}(\mathcal{C})$, then B also admits a left action of R so that ϕ is a map of left R-modules. In particular, if there exists a center $\mathfrak{Z}(A)$ for A, then $\mathfrak{Z}(A)$ acts on B via some map $\mathfrak{Z}(A) \to \mathfrak{Z}(B)$. Applying Proposition 7.5.3.4 for $n > 0$, one can argue that this map is unique up to a contractible space of choices.

The basic example of interest to us is the following:

Proposition 7.5.3.6. *Let $\mathrm{Alg}^{(1)}$ denote the symmetric monoidal ∞-category of $\mathbb{E}_1$-rings, which we regard as left-tensored over itself. Suppose we are given morphisms $A \xrightarrow{\phi} B \xrightarrow{\psi} C$ in $\mathrm{Alg}^{(1)}$ such that C is quasi-commutative and ϕ is étale(so that A and B are also quasi-commutative). Then ϕ is cocentric relative to ψ.*

Proof. Let us regard the ∞-categories ${}_B\mathrm{BMod}_B(\mathrm{Sp})$ and ${}_A\mathrm{BMod}_A(\mathrm{Sp})$ as left-tensored over the ∞-category of spectra. Using Theorem 5.3.1.30, we deduce that the centralizers $\mathfrak{Z}(\psi)$ and $\mathfrak{Z}(\psi \circ \phi)$ exist, and are given by

$$\mathfrak{Z}(\psi) \simeq \mathrm{Mor}_{{}_B\mathrm{BMod}_B(\mathrm{Sp})}(B, C) \qquad \mathfrak{Z}(\psi \circ \phi) \simeq \mathrm{Mor}_{{}_A\mathrm{BMod}_A(\mathrm{Sp})}(A, C) \simeq \mathrm{Mor}_{{}_B\mathrm{BMod}_B(\mathrm{Sp})}(B \otimes_A B, C).$$

To show that the canonical map $\mathfrak{Z}(\psi) \to \mathfrak{Z}(\psi \circ \phi)$ is an equivalence of spectra, it suffices to show that it induces an isomorphism on homotopy groups.

Let K denote the fiber of the map $B \otimes_A B \to B$; we wish to show that $\mathrm{Ext}^n_{{}_B\mathrm{BMod}_B(\mathrm{Sp})}(K, C) \simeq 0$ for every integer n. Since ϕ is étale, there exists an element $\overline{e} \in \mathrm{Tor}_0^{\mathbf{Z}}(\pi_0 B, \pi_0 B)$ whose image $e \in \mathrm{Tor}_0^{\pi_0 A}(\pi_0 B, \pi_0 B)$ is an idempotent satisfying $\mathrm{Tor}_0^{\pi_0 A}(\pi_0 B, \pi_0 B)[e^{-1}] \simeq \pi_0 B$. According to Lemma 7.5.1.14, the image x of $\overline{e}$ in $\pi_0(B \otimes B^{\mathrm{rev}})$ is quasi-central. Since C is quasi-commutative, multiplication by x induces the identity map from $\pi_* C$ to itself. It will therefore suffice to show that K is x-nilpotent, which is clear (since the homotopy groups of K are annihilated by multiplication by $\overline{e}$). □

Corollary 7.5.3.7. *Every étalemorphism in $\mathrm{Alg}^{(1)}$ is cocentric.*

Corollary 7.5.3.8. *Let R be an $\mathbb{E}_2$-ring and let A be an $\mathbb{E}_1$-algebra over R. Suppose we are given an étalemap $\phi : A \to B$ of $\mathbb{E}_1$-rings. Then there exists an R-algebra structure on B such that ϕ lifts to a morphism of $\mathbb{E}_1$-algebras over R.*

Proof. Combine Propositions 7.5.3.6 and 7.5.3.4 (in the case $n = 1$). □

Corollary 7.5.3.9. *Let R be an $\mathbb{E}_2$-ring and let A be an $\mathbb{E}_1$-algebra over R. Suppose we are given a commutative diagram*

$$\begin{array}{ccc} \partial \Delta^m & \longrightarrow & (\mathrm{Alg}^{(1)}_R)_{A/} \\ \downarrow & \nearrow & \downarrow q \\ \Delta^m & \xrightarrow{U} & (\mathrm{Alg}^{(1)})_{A/} \end{array}$$

小红书
小红书号:3189205503 qq

(here we have arranged that q is a categorical fibration). If the map $A \to U(0)$ is étaleand the image of $U(n)$ in $\mathrm{Alg}^{(1)}$ is quasi-commutative, then there exists a dotted arrow as indicated, rendering the diagram commutative.

Proof. Combine Proposition 7.5.3.6 with Proposition 7.5.3.4 (in the case $n = m + 1$). □

Corollary 7.5.3.10. *Let R be an $\mathbb{E}_2$-ring. Suppose we are given maps $\phi : A \to B$ and $\psi : A \to C$ of quasi-commutative $\mathbb{E}_1$-algebras over R, where ϕ is étale. Let $\theta : \mathrm{Alg}^{(1)}_R \to \mathrm{Alg}^{(1)}$ be the forgetful functor. Then θ induces a homotopy equivalence*

$$\mathrm{Map}_{(\mathrm{Alg}^{(1)}_R)_{A/}}(B, C) \to \mathrm{Map}_{\mathrm{Alg}^{(1)}_{\theta(A)/}}(\theta(B), \theta(C)).$$

Notation 7.5.3.11. Let R be an $\mathbb{E}_2$-ring, and suppose we are given a map $\psi : A \to C$ of quasi-commutative $\mathbb{E}_1$-algebras over R. We let $(\mathrm{Alg}^{(1)}_R)^{\mathrm{ét}}_{A//C}$ denote the full subcategory of $(\mathrm{Alg}^{(1)}_R)_{A//C}$ spanned by those diagrams

$$\begin{array}{ccc} & B & \\ {\scriptstyle\phi}\nearrow & & \searrow \\ A & \xrightarrow{\psi} & C \end{array}$$

where ϕ is étale.

Corollary 7.5.3.12. *Let R be an $\mathbb{E}_2$-ring and let A be a quasi-commutative $\mathbb{E}_1$-algebra over R. Then the forgetful functor*

$$(\mathrm{Alg}^{(1)}_R)^{ét}_{A//C} \to \mathrm{Alg}^{(1),ét}_{A//C}$$

is an equivalence of ∞-categories.

Proof. Combine Corollaries 7.5.3.10 and 7.5.3.8. □

Corollary 7.5.3.13. *Let R be an $\mathbb{E}_2$-ring and let $\psi : A \to C$ be a morphism of quasi-commutative $\mathbb{E}_1$-algebras over R. Then the construction $B \mapsto \pi_0 B$ induces an equivalence of ∞-categories*

$$(\mathrm{Alg}^{(1)}_R)^{ét}_{A//C} \to \mathrm{N}(\mathrm{Ring}^{ét}_{\pi_0 A//\pi_0 C}).$$

Proof. Combine Corollary 7.5.3.12 with Theorem 7.5.2.20. □

Proof of Proposition 7.5.3.4. Let $p : \mathcal{M}^{\circledast} \to \mathcal{C}^{\circledast}$ be defined as in Notation 4.2.2.17. Then R determines a map $\mathrm{N}(\mathbf{\Delta})^{op} \to \mathcal{C}^{\circledast}$. We let $\mathcal{N}$ denote the fiber product $\mathcal{M}^{\circledast} \times_{\mathcal{C}^{\circledast}} \mathrm{N}(\mathbf{\Delta})^{op}$, so that the projection map $q : \mathcal{N} \to \mathrm{N}(\mathbf{\Delta})^{op}$ is a locally coCartesian fibration whose fibers are canonically equivalent to the ∞-category $\mathcal{M}$. Using Corollary 4.2.2.16 and Proposition HTT.A.2.3.1 , we see that it suffices to solve the weakly equivalent lifting problem

$$\begin{array}{ccc} \Lambda^n_0 & \xrightarrow{\overline{U}_0} & \mathrm{LMod}^{\mathbb{A}^{\infty}}_R(\mathcal{M}) \\ \downarrow & & \downarrow \\ \Delta^n & \xrightarrow{V} & \mathcal{M}. \end{array}$$

小红书
小红书号:3189205503 qq

Here we can identify $\mathrm{LMod}_R^{\mathbb{A}^\infty}(\mathcal{M})$ with a full subcategory of the ∞-category $\mathrm{Fun}_{\mathrm{N}(\mathbf{\Delta})^{op}}(\mathrm{N}(\mathbf{\Delta})^{op}, \mathcal{N})$ of sections of q. Consequently, $\overline{U}_0$ determines a map $f : \mathrm{N}(\mathbf{\Delta})^{op} \times \Lambda^n_0 \to \mathcal{N}$. To construct $\overline{U}$, we must find a suitable map $F : \mathrm{N}(\mathbf{\Delta})^{op} \times \Delta^n \to \mathcal{N}$ extending f.

Let $X = \mathrm{N}(\mathbf{\Delta})^{op} \times \Lambda^n_0$, and let $X' = X \coprod_{\{[0]\} \times \Lambda^n_0} (\{[0]\} \times \Delta^n)$. We regard X' as a simplicial subset of $\mathrm{N}(\mathbf{\Delta})^{op} \times \Delta^n$. Amalgamating f and V, we obtain a map $f' : X' \to \mathcal{N}$. Let X'' denote the simplicial subset of $\mathrm{N}(\mathbf{\Delta})^{op} \times \Delta^n$ given by the union of X' with those simplices σ whose intersection with $\mathrm{N}(\mathbf{\Delta})^{op} \times \Delta^{\{1,\ldots,n\}}$ is contained in $\{[0]\} \times \Delta^{\{1,\ldots,n\}}$. We claim that the inclusion $X' \hookrightarrow X''$ is a categorical equivalence. Note that there is a pushout diagram

$$\begin{array}{ccc} (\mathrm{N}(\mathbf{\Delta}_{[0]/})^{op} \star \partial\, \Delta^{\{1,\ldots,n\}}) \coprod_{\Lambda^n_0} \Delta^{n\,i} & \longrightarrow & \mathrm{N}(\mathbf{\Delta}_{[0]/})^{op} \star \Delta^{\{1,\ldots,n\}} \\ \downarrow & & \downarrow \\ X' & \longrightarrow & X''. \end{array}$$

It will therefore suffice to show that the map i is a categorical equivalence: that is, that the diagram

$$\begin{array}{ccc} \Lambda^n_0 & \longrightarrow & \Delta^n \\ \downarrow & & \downarrow \\ \mathrm{N}(\mathbf{\Delta}_{[0]/})^{op} \star \partial\, \Delta^{\{1,\ldots,n\}} & \longrightarrow & \mathrm{N}(\mathbf{\Delta}_{[0]/})^{op} \star \Delta^{\{1,\ldots,n\}} \end{array}$$

is a homotopy pushout square (with respect to the Joyal model structure). This follows immediately from the observation that the inclusion $\{[0]\} \hookrightarrow \mathrm{N}(\mathbf{\Delta}_{[0]/})^{op}$ is right anodyne.

Let $X''' \subseteq \mathrm{N}(\mathbf{\Delta})^{op} \times \Delta^n$ be the simplicial subset consisting of X together with all those non-degenerate simplices σ whose intersection with $\mathrm{N}(\mathbf{\Delta})^{op} \times \{1\}$ is contained in $\{[0]\} \times \{1\}$. To prove this, we let K denote the product $\mathrm{N}(\mathbf{\Delta})^{op} \times \Delta^{\{2,\ldots,n\}}$ and $K_0 \subseteq K$ the simplicial subset given by

$$(\mathrm{N}(\mathbf{\Delta})^{op} \times \partial\, \Delta^{\{2,\ldots,n\}}) \coprod_{\{[0]\} \times \partial\, \Delta^{\{2,\ldots,n\}}} (\{[0]\} \times \Delta^{\{2,\ldots,n\}}).$$

Since $[0]$ is an initial object of $\mathrm{N}(\mathbf{\Delta})^{op}$, the inclusion $K_0 \hookrightarrow K$ is left anodyne. It follows that the diagram

$$\begin{array}{ccc} \mathrm{N}(\mathbf{\Delta}_{[0]/})^{op} \star K_0 & \longrightarrow & \mathrm{N}(\mathbf{\Delta}_{[0]/})^{op} \star K_0^{\triangleleft} \\ \downarrow & & \downarrow \\ \mathrm{N}(\mathbf{\Delta}_{[0]/})^{op} \star K & \longrightarrow & \mathrm{N}(\mathbf{\Delta}_{[0]/})^{op} \star K^{\triangleleft} \end{array}$$

is a homotopy pushout square (with respect to the Joyal model structure). We have a pushout diagram of simplicial sets

$$\begin{array}{ccc} (\mathrm{N}(\mathbf{\Delta}_{[0]/})^{op} \star K_0^{\triangleleft}) \coprod_{\mathrm{N}(\mathbf{\Delta}_{[0]/})^{op} \star K_0} (\mathrm{N}(\mathbf{\Delta}_{[0]/})^{op} \star K) & \longrightarrow & \mathrm{N}(\mathbf{\Delta}_{[0]/})^{op} \star K^{\triangleleft} \\ \downarrow & & \downarrow \\ X'' & \longrightarrow & X''', \end{array}$$

小红书 小红书号:3189205503 qq

so that the inclusion $X'' \hookrightarrow X'''$ is a categorical equivalence. It follows that the inclusion $X' \hookrightarrow X'''$ is also a categorical equivalence. Because q is a categorical fibration, the lifting problem depicted in the diagram

$$\begin{array}{ccc} X' & \xrightarrow{f'} & \mathcal{N} \\ \downarrow & \overset{F_0}{\nearrow} & \downarrow{\scriptstyle q} \\ X''' & \longrightarrow & \mathrm{N}(\mathbf{\Delta})^{op} \end{array}$$

admits a solution.

Let S be the collection of all nondegenerate simplices $\sigma : \Delta^m \to \mathrm{N}(\mathbf{\Delta})^{op} \times \Delta^{\{1,\ldots,n\}}$ such that the induced map $\Delta^m \to \Delta^{\{1,\ldots,n\}}$ is surjective and $\sigma(0) = ([k], 1)$ for $k > 0$. If σ is a nondegenerate simplex $\Delta^m \to \mathrm{N}(\mathbf{\Delta})^{op} \times \Delta^n$ which is not contained in X''', we let λ_σ denote the smallest integer such that $\sigma(\lambda_\sigma) = ([k], 1)$ for $k > 0$, and define the *tail* of σ to be the simplex $t(\sigma) = (\sigma | \Delta^{\{\lambda_\sigma, \lambda_{\sigma+1}, \ldots, m\}})$, so that $t(\sigma) \in S$. Choose a well-ordering of S such that $\sigma < \sigma'$ whenever σ has dimension smaller than that of σ'. Let α denote the order type of S, so that we have a bijection

$$\{\beta : \beta < \alpha\} \to S$$

$$\beta \mapsto \sigma_\beta.$$

For every ordinal $\beta \leq \alpha$, let $\mathcal{E}_\beta \subseteq \mathrm{N}(\mathbf{\Delta})^{op} \times \Delta^n$ be the simplicial subset consisting of those nondegenerate simplices σ which either belong to X''' or satisfy $t(\sigma) = \sigma_\gamma$ for some $\gamma < \beta$, so that $\mathcal{E}_0 = X'''$. We will extend F_0 to a compatible family of maps $F_\beta \in \mathrm{Fun}_{\mathrm{N}(\mathbf{\Delta})^{op}}(\mathcal{E}_\beta, \mathcal{N})$. The construction proceeds by induction on β. If β is a limit ordinal, we set $F_\beta = \bigcup_{\gamma < \beta} F_\gamma$.

Let us assume that F_β has been defined for some $\beta < \alpha$; our goal is to construct $F_{\beta+1}$. Let $\sigma = \sigma_\beta : \Delta^m \to \mathrm{N}(\mathbf{\Delta})^{op} \times \Delta^n$. Let Y denote the full subcategory of $(\mathrm{N}(\mathbf{\Delta})^{op} \times \Delta^n)_{/\sigma}$ spanned by those objects whose image in $\mathrm{N}(\mathbf{\Delta})^{op} \times \Delta^n$ are either of the form $([k], 0)$ or $([0], 1)$, so that we have a pushout diagram of simplicial sets

$$\begin{array}{ccc} Y \star \partial \Delta^m & \longrightarrow & Y \star \Delta^m \\ \downarrow & & \downarrow \\ \mathcal{E}_\beta & \longrightarrow & \mathcal{E}_{\beta+1}\,. \end{array}$$

Consequently, to construct $F_{\beta+1}$ from F_β, it suffices to solve the lifting problem depicted in the diagram

$$\begin{array}{ccc} Y \star \partial \Delta^m & \longrightarrow & \mathcal{N} \\ \downarrow & \nearrow & \downarrow{\scriptstyle q} \\ Y \star \Delta^m & \longrightarrow & \mathrm{N}(\mathbf{\Delta})^{op}. \end{array}$$

小红书
小红书号:3189205503 qq

Let g denote the composite map $Y \to \mathcal{E}_\beta \xrightarrow{F_\beta} \mathcal{N}$, so that we can rewrite our lifting problem as follows:

$$\begin{array}{ccc} \partial \Delta^m & \longrightarrow & \mathcal{N}_{g/} \\ \downarrow & \nearrow & \downarrow q \\ \Delta^m & \longrightarrow & (\mathrm{N}(\mathbf{\Delta})^{op})_{qg/}. \end{array}$$

Let $\sigma(0) = ([k], 1)$ for some $k > 0$. Note that there is a left cofinal map $\Lambda^2_0 \to Y$, whose image in $\mathrm{N}(\mathbf{\Delta})^{op} \times \Delta^n$ is the diagram

$$([k], 0) \leftarrow ([0], 0) \to ([0], 1).$$

Let $g_0 = g|\Lambda^2_0$. Since the map $\mathcal{N}_{g/} \to \mathcal{N}_{g_0/} \times_{(\mathrm{N}(\mathbf{\Delta})^{op})_{qg_0/}} (\mathrm{N}(\mathbf{\Delta})^{op})_{qg/}$ is a trivial Kan fibration, it suffices to solve the lifting problem depicted in the diagram τ :

$$\begin{array}{ccc} \partial \Delta^m & \xrightarrow{h_0} & \mathcal{N}_{g_0/} \\ \downarrow & \nearrow & \downarrow q' \\ \Delta^m & \longrightarrow & (\mathrm{N}(\mathbf{\Delta})^{op})_{qg_0/}. \end{array}$$

We now treat the special case $m = 0$ (in which case we must also have $n = 1$). Let δ denote the unique map $[0] \to [k]$ in $\mathrm{N}(\mathbf{\Delta})^{op}$. We are required to choose a commutative diagram

$$\begin{array}{ccc} F_\beta([0], 0) & \xrightarrow{F_\beta(\delta, \mathrm{id})} & F_\beta([k], 0) \\ \downarrow & & \downarrow \\ F_\beta([0], 1) & \xrightarrow{u} & X \end{array}$$

in the ∞-category $\mathcal{N}$ covering the diagram

$$\begin{array}{ccc} [0] & \xrightarrow{\delta} & [k] \\ \downarrow \mathrm{id} & & \downarrow \mathrm{id} \\ [0] & \xrightarrow{\delta} & [k] \end{array}$$

in $\mathrm{N}(\mathbf{\Delta})^{op}$. Note that q is a locally coCartesian fibration, and that $F_\beta(\delta, \mathrm{id})$ is a locally q-coCartesian morphism (since $\overline{U}_0(0)$ belongs to $\mathrm{LMod}^{\mathbb{A}_\infty}(\mathcal{M})$). We can therefore make our choice in such a way that u is also locally q-coCartesian. This strategy guarantees that our maps F_β satisfy the following additional condition:

($*$) If $n = 1$ and $([k], 1) \in \mathcal{E}_\beta$, then F_β induces a locally q-coCartesian morphism $F_\beta([0], 1) \to F_\beta([k], 1)$.

小红书
小红书号:3189205503 qq

Let us now treat the case where $m > 0$. Define objects $\overline{B}, \overline{C} \in \mathcal{N}_{g_0/}$ by $\overline{B} = h_0(0)$ and let $\overline{C} = h_0(m)$. To prove that the lifting problem depicted in the diagram τ admits a solution, it suffices to show that the mapping space $\mathrm{Map}_{\mathcal{N}_{g_0/}}(\overline{B}, \overline{C})$ is contractible. Let us abuse notation by identifying each fiber of q with the ∞-category $\mathcal{M}$, so that (by virtue of $(*)$) we may assume that $\overline{B}$ and $\overline{C}$ have images $B, C \in \mathcal{M}$. Note that $q'(Y)$ determines a morphism $v : [k'] \to [k]$ in $\mathbf{\Delta}$. Let $j = k - v(k')$. Unwinding the definitions, we see that $\mathrm{Map}_{\mathcal{N}_{g_0/}}(\overline{B}, \overline{C})$ can be identified with the total homotopy fiber of a diagram

$$\begin{array}{ccc} \mathrm{Map}_{\mathcal{M}}(R^{\otimes j} \otimes B, C) & \longrightarrow & \mathrm{Map}_{\mathcal{M}}(R^{\otimes j} \otimes A, C) \\ \downarrow{\scriptstyle \theta_0} & & \downarrow{\scriptstyle \theta_1} \\ \mathrm{Map}_{\mathcal{M}}(B, C) & \longrightarrow & \mathrm{Map}_{\mathcal{M}}(A, C) \end{array}$$

over a point having image $\psi \in \mathrm{Map}_{\mathcal{M}}(B, C)$. Our assumption that ϕ is cocentric relative to ψ guarantees that the centralizers $\mathfrak{Z}(\psi)$ and $\mathfrak{Z}(\psi \circ \phi)$ exist. Note that the homotopy fiber of θ_0 over ψ can be identified with the mapping space $\mathrm{Map}_{\mathcal{C}_{\mathbf{1}/}}(R^{\otimes j}, \mathfrak{Z}(\psi))$, and the homotopy fiber of θ_1 over $\psi \circ \phi$ can be identified with the mapping space $\mathrm{Map}_{\mathcal{C}_{\mathbf{1}/}}(R^{\otimes j}, \mathfrak{Z}(\psi \circ \phi))$. To complete the construction of $F_{\beta+1}$, it suffices to show that the canonical map $\mathfrak{Z}(\psi) \to \mathfrak{Z}(\psi \circ \phi)$ is an equivalence in $\mathcal{C}$; this follows from our assumption that ϕ is cocentric relative to ψ.

Since $\mathcal{E}_\alpha = \mathrm{N}(\mathbf{\Delta})^{op} \times \Delta^n$, the morphism $F = F_\alpha$ determines a map $\overline{U} : \Delta^n \to \mathrm{Fun}_{\mathrm{N}(\mathbf{\Delta})^{op}}(\mathrm{N}(\mathbf{\Delta})^{op}, \mathcal{N})$ extending $\overline{U}_0$. To complete the proof, it suffices to show that $\overline{U}$ factors through the full subcategory $\mathrm{LMod}_R^{\mathbb{A}^\infty}(\mathcal{M}) \subseteq \mathrm{Fun}_{\mathrm{N}(\mathbf{\Delta})^{op}}(\mathrm{N}(\mathbf{\Delta})^{op}, \mathcal{N})$. This is automatic if $n > 1$. When $n = 1$, it follows from the fact that our construction satisfies condition $(*)$. □

7.5.4 ÉtaleMorphisms of $\mathbb{E}_k$-Rings

Let $2 \leq k \leq \infty$ and let A be an $\mathbb{E}_k$-ring. Theorem 7.5.0.6 asserts that every étalemap of commutative rings $\pi_0 A \to B_0$ can be lifted (in an essentially unique way) to an étalemap between $\mathbb{E}_k$-rings $\phi : A \to B$. Our goal in this section is to prove Theorem 7.5.0.6. In fact, we will prove a slightly stronger result, which characterizes the $\mathbb{E}_k$-ring B by a universal property. To state this result, we need to introduce a bit of terminology.

Notation 7.5.4.1. Let $2 \leq k \leq \infty$, let R be an $\mathbb{E}_{k+1}$-ring, and let A be an $\mathbb{E}_k$-algebra over R. We let $(\mathrm{Alg}_R^{(k)})^{\mathrm{ét}}_{A/}$ denote the full subcategory of $(\mathrm{Alg}_R^{(k)})_{A/}$ spanned by the étalemorphisms $\phi : A \to B$ of $\mathbb{E}_k$-algebras over R. If we are given a morphism of $\mathbb{E}_k$-algebras $\psi : A \to C$, we let $(\mathrm{Alg}_R^{(k)})^{\mathrm{ét}}_{A//C}$ denote the full subcategory of $(\mathrm{Alg}_R^{(k)})_{A//C}$ spanned by those diagrams

$$\begin{array}{ccc} & B & \\ {\scriptstyle \phi}\nearrow & & \searrow \\ A & \xrightarrow{\psi} & C \end{array}$$

小红书
小红书号:3189205503 qq

where ϕ is étale.

Theorem 7.5.4.2. *Fix $2 \leq k \leq \infty$, let R be an $\mathbb{E}_{k+1}$-ring, and let $\psi : A \to C$ be a morphism of $\mathbb{E}_k$-algebras over R. Then the construction $B \mapsto \pi_0 B$ induces an equivalence of ∞-categories*

$$(\mathrm{Alg}_R^{(k)})^{ét}_{A//C} \to \mathrm{N}(\mathrm{Ring}^{ét}_{\pi_0 A//\pi_0 C}).$$

In the special case $C = 0$ of Theorem 7.5.4.2, we recover Theorem 7.5.0.6; for the reader's convenience we recall the statement:

Corollary 7.5.4.3. *Let $2 \leq k \leq \infty$, let R be an $\mathbb{E}_{k+1}$-ring, let A be an $\mathbb{E}_k$-algebra over R. Then the forgetful functor $B \mapsto \pi_0 B$ induces an equivalence from $(\mathrm{Alg}_R^{(k)})^{ét}_{A/}$ to the nerve of the ordinary category of étale$\pi_0 A$-algebras.*

Theorem 7.5.4.2 has some other pleasant consequences.

Corollary 7.5.4.4. *Let $k \geq 2$, let R be an $\mathbb{E}_{k+1}$-ring, and let A be an $\mathbb{E}_k$-algebra over R. If $\phi : A \to B$ is an étalemorphism in $\mathrm{Alg}_R^{(k)}$, then ϕ exhibits B as a compact object of $(\mathrm{Alg}_R^{(k)})_{A/}$.*

Corollary 7.5.4.5. *Let $2 \leq k \leq \infty$, let R be an $\mathbb{E}_{k+1}$-ring, and let $f : A \to B$ be an étalemorphism between connective $\mathbb{E}_k$-algebras over R. Then the relative cotangent complex $L_{B/A} \in \mathrm{Sp}((\mathrm{Alg}_R^{(k)})_{/B}) \simeq \mathrm{Mod}_B^{\mathbb{E}_k}(\mathrm{LMod}_R)$ vanishes.*

Proof. Let $\mathcal{C} = \mathrm{Mod}_B^{\mathbb{E}_k}(\mathrm{LMod}_R)$. Fix an object $M \in \mathcal{C}$, and let $C = B \oplus M \in \mathrm{Alg}_R^{(k)}$ denote the corresponding square-zero extension. We wish to prove that $\mathrm{Map}_{\mathcal{C}}(L_{B/A}, M)$ is contractible. For this, it suffices to show that composition with f induces a homotopy equivalence $\mathrm{Map}_{(\mathrm{Alg}_R^{(k)})_{/B}}(B, C) \to \mathrm{Map}_{(\mathrm{Alg}_R^{(k)})_{/B}}(A, C)$. Using Theorem 7.5.4.2, we are reduced to proving that the map

$$\mathrm{Hom}_{\mathrm{Ring}_{/\pi_0 B}}(\pi_0 B, \pi_0 B \oplus \pi_0 M) \to \mathrm{Hom}_{\mathrm{Ring}_{/\pi_0 B}}(\pi_0 A, \pi_0 B \oplus \pi_0 M)$$

is bijective, which follows from our assumption that $\pi_0 B$ is an étale$\pi_0 A$-algebra (Remark 7.5.0.3). □

Corollary 7.5.4.6. *Let $2 \leq k \leq \infty$, let R be an $\mathbb{E}_{k+1}$-ring, let $\phi : A \to B$ be an étalemap of $\mathbb{E}_k$-algebras over R, and let $C \in \mathrm{Alg}_R^{(k)}$ be arbitrary. Then the canonical map*

$$\mathrm{Map}_{(\mathrm{Alg}_R^{(k)})_{A/}}(B, C) \to \mathrm{Hom}_{\mathrm{Ring}_{\pi_0 A/}}(\pi_0 B, \pi_0 C)$$

is a homotopy equivalence. In particular, $\mathrm{Map}_{(\mathrm{Alg}_R^{(k)})_{A/}}(B, C)$ is homotopy equivalent to a discrete space.

Remark 7.5.4.7. Let A be an $\mathbb{E}_k$-ring for $2 \leq k \leq \infty$, and suppose we are given a map $\phi_0 : \pi_0 A \to B_0$ in the category of ordinary commutative rings. One can then study the problem of *realizing* ϕ_0 be a map of $\mathbb{E}_k$-rings: that is, finding a map of $\mathbb{E}_k$-rings $\phi : A \to B$ such that the induced map $\pi_0 A \to \pi_0 B$ can be identified with ϕ_0. In general, there may exist many choices for B. There are (at least) two different ways to narrow our selection:

小红书
小红书号:3189205503 qq

(*i*) If ϕ_0 is a flat map, then we can demand that B be *flat* over A. In this case, the homotopy groups of B are determined by the homotopy groups of A. Consequently, we have good understanding of mapping spaces $\mathrm{Map}_{(\mathrm{Alg}^{(k)})_{A/}}(C, B)$ with *codomain* B, at least in the case where C is well-understood (for example, if C is free).

(*ii*) We can demand that the canonical map

$$\mathrm{Map}_{\mathrm{Alg}^{(k)}_{A/}}(B, C) \to \mathrm{Hom}_{(\mathrm{Ring})_{\pi_0 A/}}(B_0, \pi_0 C)$$

be a homotopy equivalence for every $C \in \mathrm{Alg}^{(k)}_{A/}$. In this case, we have a good understanding of the mapping spaces $\mathrm{Map}_{\mathrm{Alg}^{(k)}_{A/}}(B, C)$ with *domain* B.

It is clear that property (*ii*) characterized B up to equivalence. If ϕ_0 is étale, then Theorem 7.5.4.2 asserts that (*i*) $\Rightarrow$ (*ii*). Moreover, Theorem 7.5.4.2 implies the existence of an A-algebra B satisfying (*i*). We therefore have an example satisfying both (*i*) and (*ii*); since property (*ii*) characterizes B up to equivalence, we conclude that (*i*) $\Rightarrow$ (*ii*). The equivalence of (*i*) and (*ii*) makes the theory of étalemorphisms between $\mathbb{E}_k$-rings extremely well-behaved.

We now turn to the proof of Theorem 7.5.4.2. According to Corollary 7.5.3.13, the conclusion of Theorem 7.5.4.2 is valid in the case $k = 1$ provided that we assume that A and C are quasi-commutative. We will prove Theorem 7.5.4.2 by reducing to the case $k = 1$, using Theorem 5.1.2.2. Note that if R is an $\mathbb{E}_{k+1}$-ring, then LMod_R is an $\mathbb{E}_k$-monoidal ∞-category, so that $\mathrm{Alg}^{(1)}_R$ inherits an $\mathbb{E}_{k-1}$-monoidal structure. In particular, if $k \geq 2$, then $\mathrm{Alg}^{(1)}_R$ inherits a monoidal structure. We begin by showing that this monoidal structure is compatible with the notion of étalemorphism introduced in Definition 7.5.0.4.

Lemma 7.5.4.8. *Let $k \geq 2$, let R be a connective $\mathbb{E}_{k+1}$-ring, and let $f : A \to A'$ be an étalemorphism of quasi-commutative $\mathbb{E}_1$-algebras over R. Let B be another $\mathbb{E}_1$-algebra over R. Assume that B and $A \otimes_R B$ are quasi-commutative. Then the induced map $f' : A \otimes_R B \to A' \otimes_R B$ is étale(in particular, $A' \otimes_R B$ is quasi-commutative).*

Proof. We have an equivalence $A' \otimes_R B \simeq A' \otimes_A (A \otimes_R B)$. Since A' is flat over A, we obtain isomorphisms

$$\theta_n : \pi_n(A' \otimes_R B) \simeq \mathrm{Tor}_0^{\pi_0 A}(\pi_0 A', \pi_n(A \otimes_R B)).$$

Let $\phi : \pi_0 A' \to \pi_0(A' \otimes_R B)$ and $\psi : \pi_0(A \otimes_R B) \to \pi_0(A' \otimes_R B)$ denote the canonical maps.

We first claim that $A' \otimes_R B$ is quasi-commutative. Let X be the collection of all elements of $\pi_0(A' \otimes_R B)$ which are central in $\pi_*(A' \otimes_R B)$. Then X is an additive subgroup of $\pi_0(A' \otimes_R B)$; to prove that $X = \pi_0(A' \otimes_R B)$ it suffices to show that it contains $\phi(a')\psi(b)$, where $a' \in \pi_0 A'$ and $b \in \pi_0(A \otimes_R B)$. This follows immediately by inspecting the isomorphisms θ_n, since A' and $A \otimes_R B$ are quasi-commutative by assumption.

小红书
小红书号:3189205503 qq

Comparing the isomorphisms θ_n and θ_0, we deduce that the canonical map

$$\mathrm{Tor}_0^{\pi_0(A \otimes_R B)}(\pi_0(A' \otimes_R B), \pi_n(A \otimes_R B)) \to \pi_n(A' \otimes_R B)$$

is an isomorphism. Thus $A' \otimes_R B$ is flat over $A \otimes_R B$. The isomorphism θ_0 shows that $\pi_0(A \otimes_R B) \to \pi_0(A' \otimes_R B)$ is an étalehomomorphism of commutative rings, so that f' is étaleas desired. □

Proof of Theorem 7.5.4.2. Since R is an $\mathbb{E}_{k+1}$-algebra, the ∞-category $\mathrm{Alg}_R^{(1)}$ is $\mathbb{E}_{k-1}$-monoidal. In what follows, we will abuse notation by identifying A and C with the corresponding $\mathbb{E}_{k-1}$-algebra objects of $\mathrm{Alg}_R^{(1)}$.

Let B be an $\mathbb{E}_1$-algebra over R. We will say that B is *good* if, for every element $x \in \pi_0 B$, left and right multiplication by x induce homotopic maps from B to itself (in the ∞-category LMod_R). We make the following elementary observations:

(*i*) If B admits the structure of an $\mathbb{E}_2$-algebra over R, then B is good (when regarded as an $\mathbb{E}_1$-algebra).

(*ii*) If B is good, then B is quasi-commutative.

(*iii*) The collection of good $\mathbb{E}_1$-algebras over R is closed under tensor products. (in particular, R itself is good).

Theorem 2.2.2.4 implies that $(\mathrm{Alg}_R^{(1)})_{/C}$ inherits an $\mathbb{E}_{k-1}$-monoidal structure. Let $\mathcal{C}$ denote the full subcategory of $(\mathrm{Alg}_R^{(1)})_{/C}$ spanned those maps $B \to C$ where B is good. Assertion (*iii*) guarantees $\mathcal{C}'$ is closed under tensor products, and therefore inherits an $\mathbb{E}_{k-1}$-monoidal structure.

Let $\mathcal{D}$ denote the full subcategory of $\mathrm{Fun}(\Delta^1, (\mathrm{Alg}_R^{(1)})_{/C})$ spanned by those maps $f : B \to B'$ in $(\mathrm{Alg}_R^{(1)})_{/C}$ such that B is good and f is étale. The functor ∞-category $\mathrm{Fun}(\Delta^1, (\mathrm{Alg}_R^{(1)})_{/C})$ is equipped with an $\mathbb{E}_{k-1}$-monoidal structure (given by pointwise tensor product; see Remark 2.1.3.4). We claim that $\mathcal{D}$ is closed under tensor products in $\mathrm{Fun}(\Delta^1, (\mathrm{Alg}_R^{(1)})_{/C})$ and therefore inherits an $\mathbb{E}_{k-1}$-monoidal structure. Since the unit object $\mathrm{id}_R : R \to R$ obviously belongs to $\mathcal{D}$, we are reduced to proving that if a pair of morphisms $f_0 : B_0 \to B_0'$ and $f_1 : B_1 \to B_1'$ belong to $\mathcal{D}$, then $(f_0 \otimes f_1) : B_0 \otimes_R B_1 \to B_0' \otimes_R B_1'$ belongs to $\mathcal{D}$. Since $B_0 \otimes_R B_1$ is good by (*iii*), it will suffice to show that $f \otimes f'$ is étale. Using (*ii*) and Lemma 7.5.4.8, we deduce that $f_0 \otimes \mathrm{id}_{B_1}$ is étale; in particular, $B_0' \otimes B_1$ is quasi-commutative. Applying Lemma 7.5.4.8 again, we conclude that $\mathrm{id}_{B_0'} \otimes f_1$ is étale. Using Remark 7.5.1.6, we conclude that $f \otimes f'$ is étale, as desired.

Let $\mathrm{Fun}^{\text{ét}}(\Delta^1, (\mathrm{Alg}_R^{(k)})_{/C})$ denote the full subcategory of $\mathrm{Fun}(\Delta^1, (\mathrm{Alg}_R^{(k)})_{/C})$ spanned by those morphisms $B \to B'$ which are étale. Using observation (*i*) and Proposition 5.1.2.2, we obtain equivalences of ∞-categories

$$(\mathrm{Alg}_R^{(k)})_{/C} \simeq \mathrm{Alg}_{/\mathbb{E}_{k-1}}(\mathcal{C})$$

$$\mathrm{Fun}^{\text{ét}}(\Delta^1, (\mathrm{Alg}_R^{(k)})_{/C}) \simeq \mathrm{Alg}_{/\mathbb{E}_{k-1}}(\mathcal{D}).$$

小红书
小红书号:3189205503 qq

Let Ring' denote the full subcategory of $\mathrm{Fun}([1], \mathrm{Ring}_{/\pi_0 C})$ spanned by the etale maps of commutative rings $B \to B'$ over $\pi_0 C$. The ∞-categories $\mathrm{N}(\mathrm{Ring}_{/\pi_0 C})$ and $\mathrm{N}(\mathrm{Ring}')$ are also endowed with $\mathbb{E}_{k-1}$-monoidal structures, arising from the coCartesian symmetric monoidal structure given by tensor products of commutative rings. Since the ∞-operad $\mathbb{E}_{k-1}$ is unital, Proposition 2.4.3.9 provides equivalences

$$\mathrm{Alg}_{/\mathbb{E}_{k-1}}(\mathrm{N}(\mathrm{Ring}_{/\pi_0 B})) \to \mathrm{N}(\mathrm{Ring}_{/\pi_0 C})$$
$$\mathrm{Alg}_{/\mathbb{E}_{k-1}}(\mathrm{N}(\mathrm{Ring}')) \to \mathrm{N}(\mathrm{Ring}').$$

The construction $B \mapsto \pi_0 B$ determines a lax $\mathbb{E}_{k-1}$-monoidal functor $\mathcal{C}^{\otimes} \to \mathrm{N}(\mathrm{Ring}_{/\pi_0 C})^{\otimes}$. Let $\overline{\mathcal{C}}^{\otimes}$ denote the fiber product $\mathcal{C}^{\otimes} \times_{\mathrm{N}(\mathrm{Ring}_{/\pi_0 C})^{\otimes}} \mathrm{N}(\mathrm{Ring}')^{\otimes}$ and $\overline{\mathcal{C}} = \mathcal{C} \times_{\mathrm{N}(\mathrm{Ring}_{/\pi_0 C})} \mathrm{N}(\mathrm{Ring}')$ its underlying ∞-category. We can identify the objects of $\overline{\mathcal{C}}$ with pairs $(B, f : \pi_0 B \to T)$, where $B \in (\mathrm{Alg}_R^{(1)})_{/C}$ is good and f is an étalemorphism in $\mathrm{Ring}_{/\pi_0 C}$.

The forgetful functor $\overline{\mathcal{C}}^{\otimes} \to \mathbb{E}_{k-1}^{\otimes}$ determines an $\mathbb{E}_{k-1}$-monoidal structure on $\overline{\mathcal{C}}$, where the tensor product of objects is given by the formula

$$(B_0, \pi_0 B_0 \to T_0) \otimes (B_1, \pi_0 B_1 \to T_1) \simeq (B_0 \otimes B_1, \pi_0(B_0 \otimes B_1) \to T_0 \otimes_{\pi_0 B_0} \pi_0(B_0 \otimes B_1) \otimes_{\pi_0 B_1} T_1).$$

The construction $(f : B \to B') \mapsto (B, (\pi_0 f) : \pi_0 B \to \pi_0 B')$ determines an $\mathbb{E}_{k-1}$-monoidal functor from $\theta : \mathcal{D} \to \overline{\mathcal{C}}$. We claim that θ is an equivalence of $\mathbb{E}_{k-1}$-monoidal ∞-categories. Using Remark 2.1.3.8, we are reduced to proving that θ induces an equivalence on underlying ∞-categories. We have a commutative diagram of ∞-categories

$$\begin{array}{ccc} \mathcal{D} & \xrightarrow{\theta} & \overline{\mathcal{C}} \\ & {\scriptstyle p} \searrow \quad \swarrow {\scriptstyle q} & \\ & \mathcal{C} & \end{array}$$

where p and q are coCartesian fibrations and the functor θ carries p-coCartesian morphisms to q-coCartesian morphisms. It therefore suffices to show that θ induces an equivalence of ∞-categories after passing to the fiber over any object of $\mathcal{C}$ (Corollary HTT.2.4.4.4), which follows from Corollary 7.5.3.13.

Passing to $\mathbb{E}_{k-1}$-algebra objects, we obtain a chain of equivalences

$$\begin{aligned} \mathrm{Fun}^{\text{ét}}(\Delta^1, (\mathrm{Alg}_R^{(k)})_{/C}) &\simeq \mathrm{Alg}_{/\mathbb{E}_{k-1}}(\mathcal{D}) \\ &\simeq \mathrm{Alg}_{/\mathbb{E}_{k-1}}(\overline{\mathcal{C}}) \\ &\simeq \mathrm{Alg}_{/\mathbb{E}_{k-1}}(\mathcal{C}) \times_{\mathrm{Alg}_{/\mathbb{E}_{k-1}}(\mathrm{N}(\mathrm{Ring}_{/\pi_0 C}))} \mathrm{Alg}_{/\mathbb{E}_{k-1}}(\mathrm{N}(\mathrm{Ring}')) \\ &\simeq (\mathrm{Alg}_R^{(k)})_{/C} \times_{\mathrm{N}(\mathrm{Ring}_{/\pi_0 C})} \mathrm{N}(\mathrm{Ring}'). \end{aligned}$$

Taking homotopy fibers over the object $A \in (\mathrm{Alg}_R^{(k)})_{/C}$, we conclude that the forgetful functor

$$(\mathrm{Alg}_R^{(k)})^{\text{ét}}_{A/\ /C} \to \mathrm{N}(\mathrm{Ring}^{\text{ét}}_{\pi_0 A/\ /\pi_0 C})$$

小红书
小红书号:3189205503 qq

is an equivalence of ∞-categories. $\square$

Appendix A

Constructible Sheaves and Exit Paths

Let X be a topological space and let $\mathcal{F}$ be a locally constant sheaf of sets on X. For every point $x \in X$, we let $\mathcal{F}_x$ denote the stalk of the sheaf $\mathcal{F}$ at the point x. The construction $(x \in X) \mapsto \mathcal{F}_x$ determines a functor from the fundamental groupoid $\pi_{\leq 1} X$ of X to the category of sets: every path $p : [0,1] \to X$ from $x = p(0)$ to $y = p(1)$ determines a bijection of sets $\mathcal{F}_x \to \mathcal{F}_y$, depending on only the homotopy class of the path p. If the topological space X is sufficiently nice, then the converse holds: every functor from the fundamental groupoid of X into the category of sets arises via this construction, for some locally constant sheaf of sets $\mathcal{F}$. In fact, the category of functors $\mathrm{Fun}(\pi_{\leq 1} X, \mathcal{S}\mathrm{et})$ is *equivalent* to the category of locally constant sheaves on X.

Our goal in this appendix is to describe some generalizations of the equivalence of categories sketched above. The situation we consider will be more general in two respects:

(a) Rather than working with sheaves of sets, we will consider arbitrary $\mathcal{S}$-valued sheaves on X.

(b) We will consider not only locally constant sheaves, but sheaves that are locally constant along the strata of some stratification of X.

We begin in §A.1 by introducing the notion of a *locally constant* sheaf on an ∞-topos $\mathcal{X}$. This is a poor notion in general, but behaves well if we make a technical assumption on $\mathcal{X}$ (namely, that $\mathcal{X}$ is *locally of constant shape*: see Definition A.1.5). Under this assumption, we prove an abstract version of the equivalence described above: namely, the ∞-category of locally constant sheaves on $\mathcal{X}$ can be identified with $\mathrm{Fun}(K, \mathcal{S}) \simeq \mathcal{S}_{/K}$ (see Theorem A.1.15), where K is a Kan complex called the *shape* of $\mathcal{X}$.

For the abstract result cited above to be useful in practice, we need an explicit description of the shape of an ∞-topos $\mathcal{X}$. Suppose, for example, that $\mathcal{X}$ is the ∞-category $\mathcal{S}\mathrm{hv}(X)$ of $\mathcal{S}$-valued sheaves on a topological space X. In §A.2, we show that the shape of $\mathcal{X}$ is a homotopy invariant of X. In good cases, we can identify the shape of $\mathcal{X}$ with the singular complex $\mathrm{Sing}(X)$ of X. In §A.4, we will establish such an identification for a large class of topological spaces X (including,

小红书
小红书号:3189205503 qq

for example, all metric absolute neighborhood retracts); see Theorem A.4.19. The proof relies on a generalization of the Seifert-van Kampen theorem, which we describe in §A.3.

We can summarize the above discussion as follows: if X is a sufficiently nice topological space, then there is a fully faithful embedding $\Psi_X : \mathrm{Fun}(\mathrm{Sing}(X), \mathcal{S}) \to \mathcal{S}\mathrm{hv}(X)$, whose essential image is the ∞-category of locally constant sheaves on X. The remainder of this appendix is devoted to explaining how to enlarge the ∞-category $\mathrm{Fun}(\mathrm{Sing}(X), \mathcal{S})$ to obtain a description of sheaves on X which are not assumed to be locally constant. Suppose that X is equipped with a stratification: that is, a partition of X into subsets X_α indexed by a partially ordered set A. In §A.5, we will study the notion of an *A-constructible* sheaf on X: that is, a sheaf on X whose restriction to each stratum X_α is locally constant. In §A.6, we will define a simplicial subset $\mathrm{Sing}^A(X) \subseteq \mathrm{Sing}(X)$. Under some mild assumptions, we will show that $\mathrm{Sing}^A(X)$ is an ∞-category (Theorem A.6.4), which we call the *∞-category of exit paths in X*. Our main goal is to show that Ψ_X extends to a fully faithful embedding $\mathrm{Fun}(\mathrm{Sing}^A(X), \mathcal{S}) \to \mathcal{S}\mathrm{hv}(X)$, whose essential image is the ∞-category of A-constructible sheaves on X. We will prove a result of this type in §A.9 (Theorem A.9.3). Our proof will require some techniques for analyzing complicated ∞-categories in terms of simpler pieces, which we develop in §A.8.

Most of the results in this appendix are not explicitly used in the body of the book (an exception is the version of the Seifert-van Kampen theorem given in §A.3, which we use several times in Chapter 5). However, the description of constructible sheaves in terms of exit path ∞-categories is indirectly relevant to our study of factorizable (co)sheaves in §5.5, and should prove useful in studying applications of the theory developed there.

A.1 Locally Constant Sheaves

Let X be a topological space. A sheaf of sets $\mathcal{F}$ on X is said to be *constant* if there exists a set A and a map $\eta : A \to \mathcal{F}(X)$ such that, for every point $x \in X$, the composite map $A \to \mathcal{F}(X) \to \mathcal{F}_x$ is a bijection from A to the stalk $\mathcal{F}_x$ of $\mathcal{F}$ at x. More generally, we say that a sheaf of sets $\mathcal{F}$ is *locally constant* if every point $x \in X$ has an open neighborhood U such that the restriction $\mathcal{F}|U$ is a constant sheaf on U. The category of locally constant sheaves of sets on X is equivalent to the category of covering spaces of X. If X is path connected and semi-locally simply connected, then the theory of covering spaces guarantees that this category is equivalent to the category of sets with an action of the fundamental group $\pi_1(X, x)$ (where x is an arbitrarily chosen point of X).

Our goal in this section is to obtain an ∞-categorical analogue of the above picture. More precisely, we will replace the topological space X by an ∞-topos $\mathcal{X}$. Our goal is to introduce a full subcategory of $\mathcal{X}$ consisting of "locally constant" objects (see Definition A.1.12). We will further show that if $\mathcal{X}$ is sufficiently well-behaved, then this full subcategory is itself an ∞-topos: more precisely, it is equivalent to an ∞-category of the form $\mathcal{S}_{/K}$, for some Kan complex K. In §A.4, we will show that if $\mathcal{X}$ is the ∞-category $\mathcal{S}\mathrm{hv}(X)$ of sheaves on a well-behaved topological space X,

小红书
小红书号:3189205503 qq

then we can take K to be the Kan complex $\mathrm{Sing}(X)$.

The first step is to formulate a condition on an ∞-topos which is a counterpart to the hypothesis of semi-local simple connectivity in the usual theory of covering spaces.

Definition A.1.1. Let $\mathcal{X}$ be an ∞-topos, let $\pi_* : \mathcal{X} \to \mathcal{S}$ be the functor corepresented by the final object of $\mathcal{X}$, and let π^* be a left adjoint to π_*. We will say that $\mathcal{X}$ has *constant shape* if the composition $\pi_*\pi^* : \mathcal{S} \to \mathcal{S}$ is corepresentable.

Remark A.1.2. Recall that the *shape* of an ∞-topos $\mathcal{X}$ is the functor $\pi_*\pi^* : \mathcal{S} \to \mathcal{S}$, which can be regarded as a pro-object of the ∞-category $\mathcal{S}$ (see §HTT.7.1.6). The ∞-topos $\mathcal{X}$ has constant shape if this pro-object can be taken to be constant.

Remark A.1.3. According to Proposition HTT.5.5.2.7 , an ∞-topos $\mathcal{X}$ has constant shape if and only if the functor $\pi_*\pi^*$ preserves small limits.

Remark A.1.4. Let X be a paracompact topological space, and let $\pi_* : \mathcal{S}\mathrm{hv}(X) \to \mathcal{S}\mathrm{hv}(*) \simeq \mathcal{S}$ be the global sections functor. It follows from the results of §HTT.7.1 that we can identify the composition $\pi_*\pi^*$ with the functor $K \mapsto \mathrm{Map}_{\mathcal{T}\mathrm{op}}(X, |K|)$. Consequently, the ∞-topos $\mathcal{S}\mathrm{hv}(X)$ has constant shape if and only if there exists a simplicial set K_0 and a continuous map $f : X \to |K_0|$ such that, for every Kan complex K, composition with f induces a homotopy equivalence $\mathrm{Map}_{\mathcal{S}\mathrm{et}_\Delta}(K_0, K) \simeq \mathrm{Map}_{\mathcal{T}\mathrm{op}}(|K_0|, |K|) \to \mathrm{Map}_{\mathcal{T}\mathrm{op}}(X, |K|)$. This is guaranteed, for example, if f is a homotopy equivalence: in other words, if X is a paracompact topological space with the homotopy type of a CW complex, then X has constant shape.

Definition A.1.5. Let $\mathcal{X}$ be an ∞-topos. We will say that an object $U \in \mathcal{X}$ has *constant shape* if the ∞-topos $\mathcal{X}_{/U}$ has constant shape. We will say that $\mathcal{X}$ is *locally of constant shape* if every object $U \in \mathcal{X}$ has constant shape.

The following result guarantees that Definition A.1.5 is reasonable:

Proposition A.1.6. Let $\mathcal{X}$ be an ∞-topos, and let $\mathcal{X}'$ be the full subcategory of $\mathcal{X}$ spanned by those objects which have constant shape. Then $\mathcal{X}'$ is stable under small colimits in $\mathcal{X}$.

Proof. For each $U \in \mathcal{X}$, let $\chi_U : \mathcal{X} \to \mathcal{S}$ be the functor corepresented by U, and let $\pi^* : \mathcal{S} \to \mathcal{X}$ be a geometric morphism. Then U has constant shape if and only if the functor $\chi_U \circ \pi^*$ is corepresentable: in other words, if and only if $\chi_U \circ \pi^*$ preserves small limits (Remark A.1.3). Suppose that U is the colimit of a diagram $\{U_\alpha\}$. Then χ_U is the limit of the induced diagram of functors $\{\chi_{U_\alpha}\}$ (Proposition HTT.5.1.3.2), so that $\chi_U \circ \pi^*$ is a limit of the diagram of functors $\{\chi_{U_\alpha} \circ \pi^*\}$. If each U_α has constant shape, then each of the functors $\chi_{U_\alpha} \circ \pi^*$ preserves small limits, so that $\chi_U \circ \pi^*$ preserves small limits (Lemma HTT.5.5.2.3). □

Corollary A.1.7. Let $\mathcal{X}$ be an ∞-topos. Suppose that there exists a collection of objects $U_\alpha \in \mathcal{X}$ such that the projection $U = \coprod_\alpha U_\alpha \to \mathbf{1}$ is an effective epimorphism, where $\mathbf{1}$ denotes the final

小红书
小红书号:3189205503 qq

object of $\mathcal{X}$. If each of the ∞-topoi $\mathcal{X}_{/U_\alpha}$ is locally of constant shape, then $\mathcal{X}$ is locally of constant shape.

Proof. Let $V \in \mathcal{X}$; we wish to show that V has constant shape. Let $V_0 = U \times V$, and let $V_\bullet$ be the Čech nerve of the effective epimorphism $V_0 \to V$. Since $\mathcal{X}$ is an ∞-topos, V is equivalent to the geometric realization of the simplicial object $V_\bullet$. In view of Proposition A.1.6, it will suffice to show that each V_n has constant shape. We note that V_n is a coproduct of objects of the form $U_{\alpha_0} \times \ldots \times U_{\alpha_n} \times V$. Then $\mathcal{X}_{/V_n}$ admits an étalegeometric morphism to the ∞-topos $\mathcal{X}_{/U_{\alpha_0}}$, which is locally of constant shape by assumption. It follows that $\mathcal{X}_{/V_n}$ is of constant shape. □

Proposition A.1.8. Let $\mathcal{X}$ be an ∞-topos and let $\pi^* : \mathcal{S} \to \mathcal{X}$ be a geometric morphism. The following conditions are equivalent:

(1) The ∞-topos $\mathcal{X}$ is locally of constant shape.

(2) The functor π^* admits a left adjoint $\pi_!$.

Proof. According to Corollary HTT.5.5.2.9 , condition (2) is equivalent to the requirement that π^* preserves small limits. In view of Proposition HTT.5.1.3.2 , this is equivalent to the assertion that for each $U \in \mathcal{X}$, the composition $\chi_U \circ \pi^* : \mathcal{S} \to \mathcal{S}$ preserves limits, where $\chi_U : \mathcal{X} \to \mathcal{S}$ is the functor corepresented by U. □

Let $\mathcal{X}$ be an ∞-topos which is locally of constant shape, and let $\pi_!$ and π^* be the adjoint functors appearing in Proposition A.1.8. Let $X \to Y$ be a morphism in $\mathcal{S}$ and let $Z \to \pi^* Y$ be a morphism in $\mathcal{X}$. Then we have a commutative diagram

$$\begin{array}{ccc} \pi_!(\pi^* X \times_{\pi^* Y} Z) & \longrightarrow & \pi_! Z \\ \downarrow & & \downarrow \\ \pi_! \pi^* X & \longrightarrow & \pi_! \pi^* Y \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y, \end{array}$$

and the outer square determines a canonical map $\pi_!(\pi^* X \times_{\pi^* Y} Z) \to X \times_Y \pi_! Z$.

Proposition A.1.9. Let $\mathcal{X}$ be an ∞-topos which is locally of constant shape, let $\pi^* : \mathcal{S} \to \mathcal{X}$ be a geometric morphism and $\pi_!$ a left adjoint to π^* (so that $\mathcal{X}$ is locally of constant shape). For every morphism $\alpha : X \to Y$ in $\mathcal{S}$ and every morphism $\beta : Z \to \pi^* Y$ in $\mathcal{X}$, the associated push-pull morphism

$$\pi_!(\pi^* X \times_{\pi^* Y} Z) \to X \times_Y \pi_! Z$$

is an equivalence.

小红书
小红书号:3189205503 qq

Proof. Let us first regard the morphism α as fixed, and consider the full subcategory $\mathcal{Y} \subseteq \mathcal{X}_{/\pi^* Y}$ spanned by those objects Z for which the conclusion holds. Since both $\pi_!(\pi^* X \times_{\pi^* Y} Z)$ and $X \times_Y \pi_! Z$ are colimit-preserving functors of Z, the full subcategory $\mathcal{Y}$ is stable under colimits in $\mathcal{X}_{/\pi^* Y}$. Regard Y as a Kan complex, and let $\mathcal{C}$ be the category of simplices of Y, so that we can identify Y with the colimit $\varinjlim_{C \in \mathcal{C}}(\Delta^0)$ of the constant diagram $\mathcal{C} \to \mathcal{S}$ taking the value Δ^0. For every $Z \in \mathcal{X}_{/\pi^* Y}$, we have a canonical equivalence $Z \simeq \varinjlim_{C \in \mathcal{C}}(Z \times_{\pi^* Y} \pi^* \Delta^0)$. We may therefore replace Z by the fiber product $Z \times_{\pi^* Y} \pi^* \Delta^0$, and thereby reduce to the case where β factors through the map $\pi^* \Delta^0 \to \pi^* Y$ determined by a point of Y. Replacing Y by Δ^0 and X by $X \times_Y \Delta^0$, we can reduce to the case where $Y = \Delta^0$. In this case, we must show that the canonical map $\pi_!(\pi^* X \times Z) \to X \times \pi_! Z$ is an equivalence. Let us now regard Z as fixed and consider the full subcategory $\mathcal{Z} \subseteq \mathcal{S}$ spanned by those objects for which the conclusion holds. Since the functors $\pi_!(\pi^* X \times Z)$ and $X \times \pi_! Z$ both preserve colimits in X, the full subcategory $\mathcal{Z} \subseteq \mathcal{S}$ is stable under small colimits. It will therefore suffice to show that $\Delta^0 \in \mathcal{S}$, which is obvious. □

Let $\mathcal{X}$ be an ∞-topos which is locally of constant shape. Let $\pi_!$ and π^* denote the adjoint functors appearing in Proposition A.1.8. Let $\mathbf{1}$ be a final object of $\mathcal{X}$. We have a canonical functor

$$\mathcal{X} \simeq \mathcal{X}_{/\mathbf{1}} \xrightarrow{\pi_!} \mathcal{S}_{/\pi_! \mathbf{1}},$$

which we will denote by $\psi_!$. The functor $\psi_!$ admits a right adjoint ψ^*, which can be described informally by the formula $\psi^* X = \pi^* X \times_{\pi^* \pi_! \mathbf{1}} \mathbf{1}$ (Proposition HTT.5.2.5.1). We observe that ψ^* preserves small colimits, and is therefore a geometric morphism of ∞-topoi.

Remark A.1.10. The object $\pi_! \mathbf{1} \in \mathcal{S}$ can be identified with the shape of the ∞-topos $\mathcal{X}$.

Proposition A.1.11. Let $\mathcal{X}$ be an ∞-topos which is locally of constant shape, and let $\psi^* : \mathcal{S}_{/\pi_! \mathbf{1}} \to \mathcal{X}$ be defined as above. Then ψ^* is fully faithful.

Proof. Fix an object $X \to \pi_! \mathbf{1}$ in $\mathcal{S}_{/\pi_! \mathbf{1}}$; we wish to show that the counit map $v : \psi_! \psi^* X \to X$ is an equivalence. Unwinding the definitions, we see that v can be identified with the push-pull transformation

$$\pi_!(\mathbf{1} \times_{\pi^* \pi_! \mathbf{1}} \pi^* X) \to \pi_! \mathbf{1} \times_{\pi_! \mathbf{1}} X \simeq X,$$

which is an equivalence by virtue of Proposition A.1.9. □

We now describe the essential image of the fully faithful embedding ψ^*.

Definition A.1.12. Let $\mathcal{X}$ be an ∞-topos, and let $\mathcal{F}$ be an object of $\mathcal{X}$. We will say that $\mathcal{F}$ is *constant* if it lies in the essential image of a geometric morphism $\pi^* : \mathcal{S} \to \mathcal{X}$ (the geometric morphism π^* is unique up to equivalence, by virtue of Proposition HTT.6.3.4.1). We will say that $\mathcal{F}$ is *locally constant* if there exists a small collection of objects $\{U_\alpha \in \mathcal{X}\}_{\alpha \in S}$ such that the following conditions are satisfied:

小红书
小红书号:3189205503 qq

(*i*) The objects U_α cover $\mathcal{X}$: that is, there is an effective epimorphism $\coprod U_\alpha \to \mathbf{1}$, where $\mathbf{1}$ denotes the final object of $\mathcal{X}$.

(*ii*) For each $\alpha \in S$, the product $\mathcal{F} \times U_\alpha$ is a constant object of the ∞-topos $\mathcal{X}_{/U_\alpha}$.

Remark A.1.13. Let $f^* : \mathcal{X} \to \mathcal{Y}$ be a geometric morphism of ∞-topoi. Then f^* carries constant objects of $\mathcal{X}$ to constant objects of $\mathcal{Y}$ and locally constant objects of $\mathcal{X}$ to locally constant objects of $\mathcal{Y}$.

Remark A.1.14. Let $\mathcal{F}$ be a locally constant object of $\mathcal{S}\mathrm{hv}(X)$, where X is a topological space. Then there exists an open covering $\{U_\alpha \subseteq X\}$ such that each $\mathcal{F}|U_\alpha$ is constant. Moreover, if X is paracompact, we can assume that each U_α is an open F_σ set.

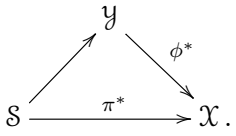
We now come to the main result of this section, which provides an ∞-categorical version of the classical theory of covering spaces.

Theorem A.1.15. Let $\mathcal{X}$ be an ∞-topos which is locally of constant shape, and let $\psi^* : \mathcal{S}_{/\pi_!\mathbf{1}} \to \mathcal{X}$ be the functor of Proposition A.1.11. Then ψ^* is a fully faithful embedding, whose essential image is the full subcategory of $\mathcal{X}$ spanned by the locally constant objects.

Proof. Suppose first that $X \to \pi_!\mathbf{1}$ is an object of $\mathcal{S}_{/\pi_!\mathbf{1}}$; we will prove that $\psi^*(X)$ is locally constant. Choose an effective epimorphism $\coprod_{\alpha \in A} K_\alpha \to \pi_!\mathbf{1}$ in $\mathcal{S}$, where each K_α is contractible. Then we obtain an effective epimorphism $\coprod_{\alpha \in A} \psi^* K_\alpha \to \mathbf{1}$; it will therefore suffice to show that each $\psi^* X \times \psi^* K_\alpha$ is a constant object of $\mathcal{X}_{/\psi^* K_\alpha}$. The composite functor

$$\mathcal{S}_{/\pi_!\mathbf{1}} \overset{\psi^*}{\to} \mathcal{X} \overset{\times \psi^* K_\alpha}{\longrightarrow} \mathcal{X}_{/\psi^* K_\alpha}$$

is equivalent to a composition of geometric morphisms



$$\mathcal{S}_{/\pi_!\mathbf{1}} \to \mathcal{S}_{/K_\alpha} \simeq \mathcal{S} \to \mathcal{X}_{/\psi^* K_\alpha}$$

and so its essential image consists of constant objects.

For the converse, suppose that $\mathcal{F} \in \mathcal{X}$ is a locally constant object; we wish to show that $\mathcal{F}$ belongs to the essential image of ψ^*. Since $\mathcal{F}$ is locally constant, there exists a diagram $\{U_\alpha\}$ in $\mathcal{X}$ having colimit $\mathbf{1}$, such that each product $U_\alpha \times \mathcal{F}$ is a constant object of $\mathcal{X}_{/U_\alpha}$. We observe that $\mathcal{S}_{/\pi_!\mathbf{1}}$ can be identified with the limit of the diagram of ∞-categories $\{\mathcal{S}_{/\pi_! U_\alpha}\}$, and that $\mathcal{X}$ can be identified with the limit of the diagram of ∞-categories $\{\mathcal{X}_{/U_\alpha}\}$ (Theorem HTT.6.1.3.9). Moreover, the fully faithful embedding ψ^* is the limit of fully faithful embeddings $\psi^*_\alpha : \mathcal{S}_{/\pi_! U_\alpha} \to \mathcal{X}_{/U_\alpha}$. Consequently, $\mathcal{F}$ belongs to the essential image of ψ^* if and only if each product $\mathcal{F} \times U_\alpha$ belongs to the essential image of ψ^*_α. We may therefore replace $\mathcal{X}$ by $\mathcal{X}_{/U_\alpha}$ and thereby reduce to the case where $\mathcal{F}$ is constant. In this case, $\mathcal{F}$ belongs to the essential image of *any* geometric morphism $\phi^* : \mathcal{Y} \to \mathcal{X}$,

小红书
小红书号:3189205503 qq

since we have a homotopy commutative diagram of geometric morphisms

□

Corollary A.1.16. Let $\mathcal{X}$ be an ∞-topos which is locally of constant shape. Then the collection of locally constant objects of $\mathcal{X}$ is stable under small colimits.

Corollary A.1.17. Let $\mathcal{X}$ be an ∞-topos which is locally of constant shape. Then for every locally constant object $X \in \mathcal{X}$, the canonical map $X \to \varprojlim \tau_{\leq n} X$ is an equivalence; in particular, X is hypercomplete.

Proof. Let $\pi_! : \mathcal{X} \to \mathcal{S}$ and $\psi^* : \mathcal{S}_{/\pi_! \mathbf{1}} \to \mathcal{X}$ be as in Proposition A.1.11. According to Theorem A.1.15, we can write $X = \psi^* X_0$ for some $X_0 \in \mathcal{S}_{/\pi_! \mathbf{1}}$. Since ψ^* commutes with truncations and preserves limits (being a right adjoint), we can replace $\mathcal{X}$ by $\mathcal{S}_{/\pi_! \mathbf{1}}$. Since the result is local on $\mathcal{X}$, we can reduce further to the case where $\mathcal{X} = \mathcal{S}$, in which case there is nothing to prove. □

A.2 Homotopy Invariance

Let X be a topological space, and let $\mathcal{F}$ be a locally constant sheaf of sets on X. If $p : [0,1] \to X$ is a continuous path from $x = p(0)$ to $y = p(1)$, then p induces a bijection between the stalks $\mathcal{F}_x$ and $\mathcal{F}_y$ of the sheaf $\mathcal{F}$, given by transport along p. More generally, if $h : Y \times [0,1] \to X$ is any homotopy from a continuous map $h_0 : Y \to X$ to a continuous map $h_1 : Y \to X$, then h induces an isomorphism of sheaves $h_0^* \mathcal{F} \simeq h_1^* \mathcal{F}$. Our goal in this section is to generalize these statements to the case where $\mathcal{F}$ is a sheaf of spaces.

Our first step is to study locally constant sheaves on the unit interval $[0,1]$. These are characterized by the following result:

Proposition A.2.1. Let X be the unit interval $[0,1]$, and let $\mathcal{F} \in \mathcal{S}\mathrm{hv}(X)$. Let $\pi_* : \mathcal{S}\mathrm{hv}(X) \to \mathcal{S}\mathrm{hv}(*) = \mathcal{S}$ be the global sections functor, and let π^* be a left adjoint to π_*. The following conditions are equivalent:

(*i*) The sheaf $\mathcal{F}$ is locally constant.

(*ii*) The sheaf $\mathcal{F}$ is constant.

(*iii*) The canonical map $\theta : \pi^* \pi_* \mathcal{F} \to \mathcal{F}$ is an equivalence.

Before giving the proof, we need an easy lemma.

小红书
小红书号:3189205503 qq

Lemma A.2.2. Let X be a contractible paracompact topological space, let $\pi_* : \mathcal{S}\mathrm{hv}(X) \to \mathcal{S}\mathrm{hv}(*) \simeq \mathcal{S}$ be the global sections functor, and let π^* be a right adjoint to π_*. Then π^* is fully faithful.

Proof. Let K be a Kan complex (regarded as an object of the ∞-category $\mathcal{S}$); we wish to prove that the unit map $u : K \to \pi_*\pi^*K$ is an equivalence. The results of §HTT.7.1 show that $\pi_*\pi^*K$ has the homotopy type of the Kan complex of maps $\mathrm{Map}_{\mathcal{T}\mathrm{op}}(X, |K|)$. Under this identification, the map u corresponds to the diagonal inclusion $K \to \mathrm{Sing}\,|K| \simeq \mathrm{Map}_{\mathcal{T}\mathrm{op}}(*, |K|) \to \mathrm{Map}_{\mathcal{T}\mathrm{op}}(X, |K|)$. Since X is contractible, this inclusion is a homotopy equivalence. □

Proof of Proposition A.2.1. The implications $(iii) \Rightarrow (ii) \Rightarrow (i)$ are obvious. We prove that $(ii) \Rightarrow (iii)$. Suppose that $\mathcal{F}$ is constant; then $\mathcal{F} \simeq \pi^*K$ for some $K \in \mathcal{S}$. Then θ admits a right homotopy inverse, given by applying π^* to the unit map $u : K \to \pi_*\pi^*K$. It follows from Lemma A.2.2 that u is an equivalence, so that θ is an equivalence as well.

We now prove that $(i) \Rightarrow (ii)$. Assume that $\mathcal{F}$ is locally constant. Let $S \subseteq [0,1]$ be the set of real numbers t such that $\mathcal{F}$ is constant in some neighborhood of the interval $[0,t] \subseteq [0,1]$. Let s be the supremum of the set S (since $\mathcal{F}$ is constant in a neighborhood of 0, we must have $s > 0$). We will show that $s \in S$. It will follow that $s = 1$ (otherwise, since $\mathcal{F}$ is locally constant on $[0, s+\epsilon]$ for ϵ sufficiently small, we would have $s + \frac{\epsilon}{2} \in S$) so that $\mathcal{F}$ is locally constant on $[0,1]$, as desired.

Since $\mathcal{F}$ is locally constant, it is constant when restricted to some open neighborhood U of $s \in [0,1]$. Since s is a limit point of S, we have $S \cap U \neq \emptyset$. Consequently, we can choose some point $t \in S \cap U$, so that $\mathcal{F}$ is constant on U and on $[0,t)$. We will prove that $\mathcal{F}$ is constant on the neighborhood $V = U \cup [0,t)$ of $[0,s]$, so that $s \in S$ as desired.

Since $\mathcal{F}$ is constant on $[0,t)$, we have an equivalence $\alpha : (\mathcal{F}\,|[0,t)) \simeq (\pi^*K|[0,t))$ for some object $K \in \mathcal{S}$. Similarly, we have an equivalence $\beta : (\mathcal{F}\,|U) \simeq (\pi^*K'|U)$ for some $K' \in \mathcal{S}$. Restricting to the intersection, we get an equivalence $\gamma : (\pi^*K|U \cap [0,t)) \simeq (\pi^*K'|U \cap [0,t))$. Since the intersection $U \cap [0,t)$ is contractible, Lemma A.2.2 guarantees that γ is induced by an equivalance $\gamma_0 : K \simeq K'$ in the ∞-category $\mathcal{S}$. Identifying K with K' via γ_0, we can reduce to the case where $K = K'$ and γ' is homotopic to the identity. For every open subset $W \subseteq [0,1]$, let $\chi_W \in \mathcal{S}\mathrm{hv}(X)$ denote the sheaf given by the formula

$$\chi_W(W') = \begin{cases} * & \text{if } W' \subseteq W \\ \emptyset & \text{otherwise.} \end{cases}$$

We then have a commutative diagram

$$\begin{array}{ccc} \pi^*K \times \chi_{U \cap [0,t)} & \longrightarrow & \pi^*K \times \chi_U \\ \downarrow & & \downarrow \\ \pi^*K \times \chi_{[0,t)} & \longrightarrow & \mathcal{F}. \end{array}$$

This diagram induced a map $\pi^*K \times \chi_V \to \mathcal{F}$, which determines the required equivalence $\pi^*K|V \simeq \mathcal{F}\,|V$. □

小红书
小红书号:3189205503 qq

Remark A.2.3. Proposition A.2.1 remains valid (with essentially the same proof) if we replace the closed unit interval $[0,1]$ by an open interval $(0,1)$ or a half-open interval $[0,1)$.

Let $h_0, h_1 : X \to Y$ be a pair of continuous maps from a topological space X to another topological space Y. If h_0 is homotopic to h_1, then there exists a continuous map $h : X \times \mathbf{R} \to Y$ such that $h_0 = h|X \times \{0\}$ and $h_1 = h|X \times \{1\}$. In this case, we can attempt to understand the relationship between the pullbacks $h_0^* \mathcal{F}$ and $h_1^* \mathcal{F}$ of a sheaf $\mathcal{F}$ on Y by studying the pullback $h^* \mathcal{F} \in \mathcal{S}\mathrm{hv}(Y \times \mathbf{R})$. If $\mathcal{F}$ is locally constant, then so is $h^* \mathcal{F}$. It will be convenient for us to consider a more general situation where $\mathcal{F}$ is only required to be locally constant *along* the paths $h|(\{y\} \times \mathbf{R})$ (and, for technical reasons, hypercomplete). The following definition axiomatizes the expected properties of the pullback $h^* \mathcal{F}$:

Definition A.2.4. Let X be a topological space and let $\mathcal{F} \in \mathcal{S}\mathrm{hv}(X \times \mathbf{R})$. We will say that $\mathcal{F}$ is *foliated* if the following conditions are satisfied:

(i) The sheaf $\mathcal{F}$ is hypercomplete (see §HTT.6.5.2).

(ii) For every point $x \in X$, the restriction $\mathcal{F}|(\{x\} \times \mathbf{R})$ is constant.

The main result of this section is the following result, which should be regarded as a relative version of Proposition A.2.1 (where we have replaced the unit interval $[0,1]$ with the entire real line):

Proposition A.2.5. Let X be a topological space, let $\pi : X \times \mathbf{R} \to X$ denote the projection, and let $\mathcal{F} \in \mathcal{S}\mathrm{hv}(X \times \mathbf{R})$. The following conditions are equivalent:

(1) The sheaf $\mathcal{F}$ is foliated.

(2) The pushforward $\pi_* \mathcal{F}$ is hypercomplete, and the counit map $v : \pi^* \pi_* \mathcal{F} \to \mathcal{F}$ is an equivalence.

The proof of Proposition A.2.5 will require a few preliminaries.

Lemma A.2.6. Let $f^* : \mathcal{X} \to \mathcal{Y}$ be a geometric morphism of ∞-topoi. Assume that f^* admits a left adjoint $f_!$. Then f^* carries hypercomplete objects of $\mathcal{X}$ to hypercomplete objects of $\mathcal{Y}$.

Proof. To show that f^* preserves hypercomplete objects, it will suffice to show that the left adjoint $f_!$ preserves ∞-connective morphisms. We will show that $f_!$ preserves n-connective morphisms for every nonnegative integer n. This is equivalent to the assertion that f^* preserves $(n-1)$-truncated morphisms, which follows from Proposition HTT.5.5.6.16 . □

Example A.2.7. Every étalemap of ∞-topoi satisfies the hypothesis of Lemma A.2.6. Consequently, if X is a hypercomplete object of an ∞-topos $\mathcal{X}$, then $X \times U$ is a hypercomplete object of $\mathcal{X}_{/U}$ for each $U \in \mathcal{X}$.

小红书
小红书号:3189205503 qq

Example A.2.8. Let X and Y be topological spaces, and let $\pi : X \times Y \to X$ be the projection. Assume that Y is locally compact and locally of constant shape. Then π^* satisfies the hypothesis of Lemma A.2.6, and therefore preserves hypercompleteness. To prove this, we observe that $\mathcal{S}\mathrm{hv}(X \times Y)$ can be identified with $\mathcal{S}\mathrm{hv}(X) \otimes \mathcal{S}\mathrm{hv}(Y)$, where $\otimes$ denotes the tensor product operation on presentable ∞-categories described in §4.8.1: this follows from Proposition HTT.7.3.1.11 and Example 4.8.1.19. The functor π^* can be identified with the tensor product $\mathrm{id}_{\mathcal{S}\mathrm{hv}(X)} \otimes \pi'^*$, where $\pi' : Y \to *$ is the projection. Proposition A.1.8 guarantees that π'^* admits a left adjoint $\pi'_!$. It follows that $\mathrm{id}_{\mathcal{S}\mathrm{hv}(X)} \otimes \pi'_!$ is a left adjoint to π^*. Moreover, if π'^* is fully faithful, then the counit map $v : \pi'_! \pi'^* \to \mathrm{id}$ is an equivalence, so the counit map $\pi_! \pi^* \to \mathrm{id}_{\mathcal{S}\mathrm{hv}(X)}$ is also an equivalence: it follows that π^* is fully faithful.

Lemma A.2.9. Let X be a topological space and let $\pi : X \times (0,1) \to X$ denote the projection. Then the pullback functor $\pi^* : \mathcal{S}\mathrm{hv}(X) \to \mathcal{S}\mathrm{hv}(X \times (0,1))$ is fully faithful (so that the unit map $\mathcal{F} \to \pi_* \pi^* \mathcal{F}$ is an equivalence for every $\mathcal{F} \in \mathcal{S}\mathrm{hv}(X)$).

Proof. Let $\psi : (0,1) \to *$ denote the projection map, and let $\psi^* : \mathcal{S} \to \mathcal{S}\mathrm{hv}((0,1))$ be the associated geometric morphism. Then ψ^* admits a left adjoint $\psi_!$ (Proposition A.1.8) and the counit transformation $v : \psi_! \psi^* \to \mathrm{id}$ is an equivalence of functors from $\mathcal{S}$ to itself. As in Example A.2.8, we can identify $\mathcal{S}\mathrm{hv}(X \times (0,1))$ with the tensor product $\mathcal{S}\mathrm{hv}(X) \otimes \mathcal{S}\mathrm{hv}((0,1))$, so that $\psi_!$ and ψ^* induce a pair of adjoint functors

$$\mathcal{S}\mathrm{hv}(X \times (0,1)) \underset{G}{\overset{F}{\rightleftarrows}} \mathcal{S}\mathrm{hv}(X).$$

The functor G can be identified with π^*. Since the counit map v is an equivalence, the counit $F \circ G \to \mathrm{id}_{\mathcal{S}\mathrm{hv}(X)}$ is likewise an equivalence, which proves that $G \simeq \pi^*$ is fully faithful. □

Variant A.2.10. In the statement of Lemma A.2.9, we can replace $(0,1)$ by a closed or half-open interval.

Proof of Proposition A.2.5. Suppose first that (2) is satisfied, and let $\mathcal{G} = \pi_* \mathcal{F}$. Then $\mathcal{G}$ is hypercomplete, so $\pi^* \mathcal{G}$ is hypercomplete (Example A.2.8); since $v : \pi^* \mathcal{G} \to \mathcal{F}$ is an equivalence, it follows that $\mathcal{F}$ is hypercomplete. It is clear that $\mathcal{F} \simeq \pi^* \mathcal{G}$ is constant along $\{x\} \times \mathbf{R}$, for each $x \in X$.

Conversely, suppose that $\mathcal{F}$ is foliated. To prove that $\pi_* \mathcal{F}$ is hypercomplete, it suffices to show that $\pi_* \mathcal{F}$ is local with respect to every ∞-connective morphism α in $\mathcal{S}\mathrm{hv}(X)$. This is equivalent to the requirement that $\mathcal{F}$ is local with respect to $\pi^*(\alpha)$. This follows from our assumption that $\mathcal{F}$ is hypercomplete, since $\pi^*(\alpha)$ is again ∞-connective. To complete the proof that (1) $\Rightarrow$ (2), it will suffice to show that the counit map $v : \pi^* \mathcal{G} \to \mathcal{F}$ is an equivalence.

For each positive integer n, let $\mathcal{F}_n = \mathcal{F} | (X \times (-n, n)) \in \mathcal{S}\mathrm{hv}(X \times (-n, n))$, let $\pi_n : X \times (-n, n) \to$

小红书 小红书号:3189205503 qq

X be the projection map, and let $\mathcal{G}_n = (\pi_n)_* \mathcal{F}$. We have a commutative diagram

$$\begin{array}{ccc} (\pi^* \mathcal{G})|(X \times (-n,n)) & \xrightarrow{v} & \mathcal{F}|(X \times (-n,n)) \\ \downarrow & & \downarrow \\ \pi_n^* \mathcal{G}_n & \xrightarrow{v_n} & \mathcal{F}_n . \end{array}$$

To prove that v is an equivalence, it will suffice to show that the left vertical and lower horizontal maps in this diagram are equivalences (for each n). This will follow from the following pair of assertions:

(a) For each $n > 0$, the restriction map $\mathcal{G}_{n+1} \to \mathcal{G}_n$ is an equivalence (so that $\mathcal{G} \simeq \varprojlim_n \mathcal{G}_n$ is equivalent to each $\mathcal{G}_n$).

(b) For each $n > 0$, the map $\pi_n^* \mathcal{G}_n \to \mathcal{F}_n$ is an equivalence.

Note that assertion (a) follows from (b): if we let $i : X \to X \times \mathbf{R}$ be the map induced by the inclusion $\{0\} \hookrightarrow \mathbf{R}$, then we have a commutative diagram

$$\begin{array}{ccc} \mathcal{G}_n & \longrightarrow & \mathcal{G}_{n+1} \\ \downarrow & & \downarrow \\ i^* \pi_n^* \mathcal{G}_n & \longrightarrow & i^* \pi_{n+1}^* \mathcal{G}_{n+1} \\ \downarrow & & \downarrow \\ i^* \mathcal{F}_n & \xrightarrow{s} & i^* \mathcal{F}_{n+1} \end{array}$$

in which the upper vertical maps are equivalences, the lower horizontal maps are equivalences by (b), and the map s is an equivalence by construction.

To prove (b), let $\mathcal{F}_n^+ \in \mathcal{S}\mathrm{hv}(X \times [-n,n])$ denote the hypercompletion of the restriction $\mathcal{F}|(X \times [-n,n])$, let $\pi^n : X \times [-n,n] \to X$ be the projection, and let $\mathcal{G}_n^+ = \pi_*^n \mathcal{F}_n^+$. Let $v' : (\pi^n)^* \mathcal{G}_n^+ \to \mathcal{F}_n^+$ be the counit map. We claim that v' is an equivalence. Since $\mathcal{F}_n^+$ is hypercomplete by assumption, $\mathcal{G}_n^+ \simeq \pi_*^n \mathcal{F}_n^+$ is likewise hypercomplete and so $(\pi^n)^* \mathcal{G}_n^+$ is hypercomplete by virtue of Example A.2.8. Consequently, to prove that v' is an equivalence, it will suffice to show that v' is ∞-connective. To prove this, choose a point $x \in X$ and let $j : [-n,n] \to X \times [-n,n]$ be the map induced by the inclusion $j' : \{x\} \hookrightarrow X$. We will show that $j^*(v')$ is an equivalence. Consider the diagram of ∞-topoi

$$\begin{array}{ccccc} \mathcal{S}\mathrm{hv}([-n,n]) & \xrightarrow{j_*} & \mathcal{S}\mathrm{hv}(X \times [-n,n]) & \longrightarrow & \mathcal{S}\mathrm{hv}([0,1]) \\ \downarrow{\scriptstyle \psi_*} & & \downarrow{\scriptstyle \pi_*^n} & & \downarrow{\scriptstyle \psi_*} \\ \mathcal{S}\mathrm{hv}(*) & \xrightarrow{j'_*} & \mathcal{S}\mathrm{hv}(X) & \longrightarrow & \mathcal{S}\mathrm{hv}(*). \end{array}$$

The right square and the outer rectangle are pullback diagrams (Proposition HTT.7.3.1.11), so the left square is a pullback diagram as well. Moreover, the geometric morphism ψ_* is proper (Corollary

小红书
小红书号:3189205503 qq

HTT.7.3.4.11), so that π^n_* is likewise proper and the push-pull morphism $e : j'^* \pi^n_* \to \psi_* j^*$ is an equivalence. We have a commutative diagram

$$\begin{array}{ccc} \psi^* j'^* \pi^n_* \mathcal{F}^+_n & \longrightarrow & j^* (\pi^n)^* \pi^n_* \mathcal{F}^+_n \\ \downarrow{\scriptstyle e} & & \downarrow{\scriptstyle j^*(v')} \\ \psi^* \psi_* j^* \mathcal{F}^+_n & \xrightarrow{v'_x} & j^* \mathcal{F}^+_n . \end{array}$$

By virtue of the above diagram (and the fact that e is an equivalence), we are reduced to proving that v'_x is an equivalence. To prove this, it suffices to verify that $j^* \mathcal{F}^+_n \in \mathcal{S}\mathrm{hv}([-n,n])$ is constant (Proposition A.2.1). We have an ∞-connective morphism $\theta : \mathcal{F}|(\{x\} \times [-n,n]) \to j^* \mathcal{F}^+_n$. Since every open subset of the topological space $[-n,n]$ has covering dimension ≤ 1, the ∞-topos $\mathcal{S}\mathrm{hv}([-n,n])$ is locally of homotopy dimension ≤ 1 (Theorem HTT.7.2.3.6) and therefore hypercomplete. It follows that θ is an equivalence. Since $\mathcal{F}$ is foliated, the restriction $\mathcal{F}|(\{x\} \times [-n,n])$ is constant, from which it follows immediately that $j^* \mathcal{F}^+_n$ is constant as well.

The ∞-connective morphism $\mathcal{F}|(X \times [-n,n]) \to \mathcal{F}^+_n$ induces another ∞-connective morphism $\alpha : \mathcal{F}_n \to \mathcal{F}^+_n|(X \times (-n,n))$. Since the domain and codomain of α are both hypercomplete (Example A.2.7), we deduce that α is an equivalence. In particular, we have $\mathcal{F}_n \simeq ((\pi^n)^* \mathcal{G}^+_n)|(X \times (-n,n)) = \pi^*_n \mathcal{G}^+_n$. Thus $\mathcal{F}_n$ lies in the essential image of the functor π^*_n, which is fully faithful by virtue of Lemma A.2.9. It follows that that the counit map $\pi^*_n (\pi_n)_* \mathcal{F}_n \to \mathcal{F}_n$ is an equivalence as desired. □

A.3 The Seifert-van Kampen Theorem

Let X be a topological space covered by a pair of open sets U and V, such that U, V, and $U \cap V$ are path-connected. The Seifert-van Kampen theorem asserts that, for any choice of base point $x \in U \cap V$, the diagram of groups

$$\begin{array}{ccc} \pi_1(U \cap V, x) & \longrightarrow & \pi_1(U, x) \\ \downarrow & & \downarrow \\ \pi_1(V, x) & \longrightarrow & \pi_1(X, x) \end{array}$$

is a pushout square. In this section, we will prove a generalization of the Seifert-van Kampen theorem, which describes the entire weak homotopy type of X in terms of any sufficiently nice covering of X by open sets:

Theorem A.3.1. Let X be a topological space, let $\mathcal{U}(X)$ denote the collection of all open subsets of X (partially ordered by inclusion). Let $\mathcal{C}$ be a small category and let $\chi : \mathcal{C} \to \mathcal{U}(X)$ be a functor. For every $x \in X$, let $\mathcal{C}_x$ denote the full subcategory of $\mathcal{C}$ spanned by those objects $C \in \mathcal{C}$ such that $x \in \chi(C)$. Assume that χ satisfies the following condition:

($*$) For every point x, the simplicial set $\mathrm{N}(\mathcal{C}_x)$ is weakly contractible.

小红书
小红书号:3189205503 qq

Then the canonical map $\varinjlim_{C \in \mathcal{C}} \mathrm{Sing}(\chi(C)) \to \mathrm{Sing}(X)$ exhibits the simplicial set $\mathrm{Sing}(X)$ as a homotopy colimit of the diagram $\{\mathrm{Sing}(\chi(C))\}_{C \in \mathcal{C}}$.

The proof of Theorem A.3.1 will occupy our attention throughout this section. The main step will be to establish the following somewhat weaker result:

Proposition A.3.2. Let X be a topological space, let $\mathcal{U}(X)$ be the partially ordered set of all open subsets of X, and let $S \subseteq \mathcal{U}(X)$ be a covering sieve on X. Then the canonical map $\varinjlim_{U \in S} \mathrm{Sing}(U) \to \mathrm{Sing}(X)$ exhibits the simplicial set $\mathrm{Sing}(X)$ as the homotopy colimit of the diagram of simplicial sets $\{\mathrm{Sing}(U)\}_{U \in S}$.

Proposition A.3.2 is itself a consequence of the following result, which guarantees that $\mathrm{Sing}(X)$ is weakly homotopy equivalent to the simplicial subset consisting of "small" simplices:

Lemma A.3.3. Let X be a topological space, and let $\{U_\alpha\}$ be an open covering of X. Let $\mathrm{Sing}'(X)$ be the simplicial subset of $\mathrm{Sing}(X)$ spanned by those n-simplices $|\Delta^n| \to X$ which factor through some U_α. Then the inclusion $i : \mathrm{Sing}'(X) \subseteq \mathrm{Sing}(X)$ is a weak homotopy equivalence of simplicial sets.

The proof of Lemma A.3.3 will require a few technical preliminaries.

Lemma A.3.4. Let X be a compact topological space and let K be a simplicial set. Then every continuous map $f : X \to |K|$ factors through $|K_0|$, for some finite simplicial subset $K_0 \subseteq K$.

Proof. Let K_0 be the simplicial subset of K spanned by those simplices σ such that the interior of $|\sigma|$ intersects $f(X)$. We claim that K_0 is finite. Otherwise, we can choose an infinite sequence of points $x_0, x_1, \ldots \in X$ such that each $f(x_i)$ belongs to the interior of a *different* simplex of $|K|$. Let $U = |K| - \{f(x_0), f(x_1), \ldots, \}$, and for each $i \geq 0$ let $U_i = U \cup \{f(x_i)\}$. Then the collection of open sets $\{U_i\}$ forms an open cover of K, so that $\{f^{-1}U_i\}$ forms an open covering of X. This open covering does not admit a finite subcovering, contradicting our assumption that X is compact. $\square$

Lemma A.3.5. Let $i : K_0 \subseteq K$ be an inclusion of simplicial sets. Suppose that the following condition is satisfied:

($*$) For every finite simplicial subset $L \subseteq K$, there exists a homotopy $h : |L| \times [0,1] \to |K|$ such that $h|(|L| \times \{0\})$ is the inclusion, $h|(|L| \times \{1\}) \subseteq |K_0|$, and $h|(|L_0| \times [0,1]) \subseteq |K_0|$, where $L_0 = L \cap K_0$.

Then the inclusion i is a weak homotopy equivalence.

Proof. We first show the following:

($*'$) Let X be a compact topological space, X_0 a closed subspace, and $f : X \to |K|$ a continuous map such that $f(X_0) \subseteq |K_0|$. Then there exists a homotopy $h : X \times [0,1] \to |K|$ such that $h|(X \times \{0\}) = f$, $h(X \times \{1\}) \subseteq |K_0|$, and $h|(X_0 \times [0,1]) \subseteq |K_0|$.

小红书
小红书号:3189205503 qq

To prove $(*')$, we note that since X is compact, the map f factors through $|L|$, where L is some finite simplicial subset of K. Then $f|X_0$ factors through $|L_0|$, where $L_0 = L \cap K_0$. We may therefore replace X and X_0 by $|L|$ and $|L_0|$, in which case $(*')$ is equivalent to our assumption $(*)$.

Applying $(*')$ in the case where X is a point and X_0 is empty, we deduce that the inclusion i is surjective on connected components. It will therefore suffice to show that i induces a bijection $\phi : \pi_n(|K_0|, v) \to \pi_n(|K|, v)$ for each $n \geq 0$ and each vertex v of K. To prove that ϕ is surjective, consider a homotopy class $\eta \in \pi_n(|K|, v)$. This homotopy class can be represented by a pointed map $f : (S^n, *) \to (|K|, v)$. Applying $(*')$, we deduce that f is homotopic to a another map $g : S^n \to |K_0|$, via a homotopy which, when restricted to the base point $* \in S^n$, determines a path p from v to another point $v' \in |K_0|$. Then g determines an element $\eta' \in \pi_n(|K_0|, v')$. The image of η' under the transport isomorphism $p_* : \pi_n(|K_0|, v') \simeq \pi_n(|K_0|, v)$ is a preimage of η under ϕ.

We now prove that ϕ is injective. Suppose we are given a continuous map $f_0 : S^n \to |K_0|$ which extends to a map $f : D^{n+1} \to |K|$; we wish to show that f_0 is nullhomotopic. Applying $(*')$, we deduce that f_0 is homotopic to a map which extends over the disk D^{n+1}, and is therefore itself nullhomotopic. □

Before we can proceed with the proof of Lemma A.3.3, we need to recall some properties of the *barycentric subdivision* construction in the setting of simplicial sets.

Notation A.3.6. Let $[n]$ be an object of $\mathbf{\Delta}$. We let $P[n]$ denote the collection of all nonempty subsets of $[n]$, partially ordered by inclusion. We let $\overline{P}[n]$ denote the disjoint union $P[n] \coprod [n]$. We regard $\overline{P}[n]$ as endowed with a partial ordering which extends the partial orderings on $P[n]$ and $[n]$, where we let $i \not\leq \sigma$ for $i \in [n]$ and $\sigma \in P[n]$, while $\sigma \leq i$ if and only if each element of σ is $\leq i$.

The functors $[n] \mapsto \mathrm{N}\, P[n]$ and $[n] \mapsto \mathrm{N}\, \overline{P}[n]$ extend to colimit-preserving functors from the category of simplicial sets to itself. We will denote these functors by sd and $\overline{\mathrm{sd}}$, respectively.

Let us identify the topological n-simplex $|\Delta^n|$ which the set of all maps $t : [n] \to [0, 1]$ such that $t(0) + \ldots + t(n) = 1$. For each $n \geq 0$, there is a homeomorphism $\eta_n : |\overline{P}[n]| \to |\Delta^n| \times [0, 1]$ which is linear on each simplex, carries a vertex $i \in [n]$ to $(t_i, 0)$ where t_i is given by the formula $t_i(j) = \begin{cases} 1 & \text{if } i = j \\ 0 & \text{if } i \neq j, \end{cases}$ and carries a vertex $\sigma \in P[n]$ to the pair $(t_\sigma, 1)$, where

$$t_\sigma(i) = \begin{cases} \frac{1}{m} & \text{if } i \in \sigma \\ 0 & \text{if } i \notin \sigma \end{cases}$$

where m is the cardinality of σ. This construction is functorial in $[n]$, and induces a homeomorphism $|\overline{\mathrm{sd}} K| \to |K| \times [0, 1]$ for every simplicial set K. We observe that $\overline{\mathrm{sd}} K$ contains K and $\mathrm{sd}\, K$ as simplicial subsets, whose geometric realizations map homeomorphically to $|K| \times \{0\}$ and $|K| \times \{1\}$, respectively.

小红书
小红书号:3189205503 qq

Proof of Lemma A.3.3. We will show that i satisfies the criterion of Lemma A.3.5. Let $L \subseteq \mathrm{Sing}(X)$ be a finite simplicial subset, and let $L_0 = L \cap \mathrm{Sing}'(X)$. Fix $n \geq 0$, let $\overline{L}$ denote the iterated pushout

$$\overline{\mathrm{sd}}\,\mathrm{sd}^{n-1} L \coprod_{\mathrm{sd}^{n-1} L} \overline{\mathrm{sd}}\,\mathrm{sd}^{n-2} L \coprod_{\mathrm{sd}^{n-2} L} \cdots \coprod_{\mathrm{sd}\, L} L,$$

and define $\overline{L}_0$ similarly. Using the homeomorphisms $|\overline{\mathrm{sd}} K| \simeq |K| \times [0,1]$ of Notation A.3.6 repeatedly, we obtain a homeomorphism $|\overline{L}| \simeq |L| \times [0,n]$ (which restricts to a homeomorphism $|\overline{L}_0| \simeq |L_0| \times [0,n]$).

The inclusion map $L \subseteq \mathrm{Sing}(X)$ is adjoint to a continuous map of topological spaces $f : |L| \to X$. Let $\overline{f}$ denote the composite map

$$|\overline{L}| \simeq |L| \times [0,n] \to |L| \xrightarrow{f} X.$$

Then $\overline{f}$ determines a map of simplicial sets $\overline{L} \to \mathrm{Sing}(X)$; we observe that this map carries $\overline{L}_0$ into $\mathrm{Sing}'(X)$. Passing to geometric realizations, we get a map $h : |L| \times [0,n] \simeq |\overline{L}| \to |\mathrm{Sing}(X)|$, which is a homotopy from the inclusion $|L| \subseteq |\mathrm{Sing}(X)|$ to the map $g = h(|L| \times \{n\})$ (by construction, this homotopy carries $|L_0| \times [0,n]$ into $|\mathrm{Sing}'(X)|$). We note that g is the geometric realization of the map $\mathrm{sd}^n L \to \mathrm{Sing}'(X)$, which is adjoint to the composition $|\mathrm{sd}^n L| \simeq |L| \xrightarrow{f} X$. To complete the proof, it suffices to observe that for n sufficiently large, each simplex of the n-fold barycentric subdivision $|\mathrm{sd}^n L|$ will map into one of the open sets U_α, so that g factors through $|\mathrm{Sing}'(X)|$ as required. □

Armed with Lemma A.3.3, it is easy to finish the proof of Proposition A.3.2.

Proof of Proposition A.3.2. Choose a collection of open sets $\{U_\alpha\}_{\alpha \in A}$ which generates the sieve S. Let $P(A)$ denote the collection of all nonempty subsets of A, partially ordered by reverse inclusion. Let $P_0(A)$ be the subset consisting of nonempty *finite* subsets of A. For each $A_0 \in P(A)$, let $U_{A_0} = \bigcap_{\alpha \in A_0} U_\alpha$ (if A_0 is finite, this is an open subset of X, though in general it need not be). The construction $A_0 \mapsto U_{A_0}$ determines a map of partially ordered sets $P_0(A) \to S$. Using Theorem HTT.4.1.3.1 , we deduce that the map $\mathrm{N}(P_0(A)) \to \mathrm{N}(S)$ is left cofinal, so that (by virtue of Theorem HTT.4.2.4.1) it will suffice to show that $\mathrm{Sing}(X)$ is a homotopy colimit of the diagram $\{\mathrm{Sing}(U_{A_0})\}_{A_0 \in P_0(A)}$. A similar argument shows that the inclusion $\mathrm{N}(P_0(A)) \subseteq \mathrm{N}(P(A))$ is left cofinal, so we are reduced to showing that $\mathrm{Sing}(X)$ is a homotopy colimit of the diagram $\psi = \{\mathrm{Sing}(U_{A_0})\}_{A_0 \in P(A)}$. The actual colimit of the diagram ψ is the simplicial set $\mathrm{Sing}'(X)$ which is weakly equivalent to $\mathrm{Sing}(X)$ by Lemma A.3.3. It will therefore suffice to show that the diagram ψ is projectively cofibrant. To prove this, we will show more generally that for any pair of simplicial subsets $K_0 \subseteq K \subseteq \mathrm{Sing}(X)$, the induced map

$$\phi : \{\mathrm{Sing}(U_{A_0}) \cap K_0\}_{A_0 \in P(A)} \hookrightarrow \{\mathrm{Sing}(U_{A_0}) \cap K\}_{A_0 \in P(A)}$$

小红书
小红书号:3189205503 qq

is a projective cofibration of diagrams (taking $K_0 = \emptyset$ and $K = \mathrm{Sing}(X)$ will then yield the desired result). Working simplex by simplex, we may assume that K is obtained from K_0 by adjoining a single nondegenerate simplex $\sigma : |\Delta^n| \to X$ whose boundary already belongs to K_0. Let $A' = \{\alpha \in A : \sigma(|\Delta^n|) \subseteq U_\alpha\}$. If A' is empty, then ϕ is an isomorphism. Otherwise, ϕ is a pushout of the projective cofibration $F_0 \hookrightarrow F$, where

$$F_0(A_0) = \begin{cases} \partial\, \Delta^n & \text{if } A_0 \subseteq A' \\ \emptyset & \text{otherwise} \end{cases} \qquad F(A_0) = \begin{cases} \Delta^n & \text{if } A_0 \subseteq A' \\ \emptyset & \text{otherwise.} \end{cases}$$

□

Variant A.3.7. If X is a paracompact topological space, we can replace $\mathcal{U}(X)$ with the collection of all open F_σ subsets of X in the statement of Proposition A.3.2; the proof remains the same.

Remark A.3.8. Let X be a topological space, and let $\mathcal{U}(X)$ denote the partially ordered set of all open subsets of X. The construction $U \mapsto \mathrm{Sing}(U)$ determines a functor between ∞-categories $\mathrm{N}(\mathcal{U}(X)) \to \mathcal{S}$. Theorem HTT.5.1.5.6 implies that this functor is equivalent to a composition

$$\mathrm{N}(\mathcal{U}(X)) \xrightarrow{j} \mathcal{P}(\mathcal{U}(X)) \xrightarrow{F} \mathcal{S},$$

where j denotes the Yoneda embedding and the functor F preserves small colimits (moreover, the functor F is determined uniquely up to equivalence). Proposition A.3.2 implies that F is equivalent to the composition

$$\mathcal{P}(\mathcal{U}(X)) \xrightarrow{L} \mathcal{S}\mathrm{hv}(X) \xrightarrow{F} \mathcal{S},$$

where L denotes a left adjoint to the inclusion $\mathcal{S}\mathrm{hv}(X) \subseteq \mathcal{P}(\mathcal{U}(X))$ and we identify F with its restriction to $\mathcal{S}\mathrm{hv}(X)$. In particular, the functor $F : \mathcal{S}\mathrm{hv}(X) \to \mathcal{S}$ preserves small colimits.

We now explain how to deduce Theorem A.3.1 from Proposition A.3.2. The main technical obstacle is that the ∞-topos $\mathcal{S}\mathrm{hv}(X)$ need not be hypercomplete. We will address this problem by showing that the functor F of Remark A.3.8 factors through the hypercompletion of $\mathcal{S}\mathrm{hv}(X)$: in other words, that F carries ∞-connected morphisms in $\mathcal{S}\mathrm{hv}(X)$ to equivalences in $\mathcal{S}$ (Lemma A.3.10). We first note that ∞-connectedness is a condition which can be tested "stalkwise":

Lemma A.3.9. Let X be a topological space, and let $\alpha : \mathcal{F} \to \mathcal{F}'$ be a morphism in the ∞-category $\mathcal{S}\mathrm{hv}(X)$. For each point $x \in X$, let $x^* : \mathcal{S}\mathrm{hv}(X) \to \mathcal{S}\mathrm{hv}(\{x\}) \simeq \mathcal{S}$ denote the pullback functor. The following conditions are equivalent:

(1) The morphism α is ∞-connective.

(2) For each $x \in X$, the morphism $x^*(\alpha)$ is an equivalence in $\mathcal{S}$.

小红书
小红书号:3189205503 qq

Proof. The implication (1) $\Rightarrow$ (2) is obvious, since the pullback functors x^* preserve ∞-connectivity and the ∞-topos $\mathcal{S}$ is hypercomplete. Conversely, suppose that (2) is satisfied. We will prove by induction on n that the morphism α is n-connective. Assume that $n > 0$. By virtue of Proposition HTT.6.5.1.18 , it will suffice to show that the diagonal map $\mathcal{F} \times_{\mathcal{F}'} \mathcal{F}$ is $(n-1)$-connective, which follows from the inductive hypothesis. We may therefore reduce to the case $n = 0$: that is, we must show that α is an effective epimorphism. According to Proposition HTT.7.2.1.14 , this is equivalent to the requirement that the induced map $\alpha' : \tau_{\leq 0} \mathcal{F} \to \tau_{\leq 0} \mathcal{F}'$ is an effective epimorphism. We may therefore replace α by α' and thereby reduce to the case where $\mathcal{F}, \mathcal{F}' \in \mathcal{S}\mathrm{hv}_{\mathcal{S}\mathrm{et}}(X)$ are sheaves of sets on X, in which case the result is obvious. □

Lemma A.3.10. Let X be a topological space, and let $F : \mathcal{S}\mathrm{hv}(X) \to \mathcal{S}$ be as in Remark A.3.8. Then F carries ∞-connective morphisms of $\mathcal{S}\mathrm{hv}(X)$ to equivalences in $\mathcal{S}$.

Proof. Let α be an ∞-connectivemorphism in $\mathcal{S}\mathrm{hv}(X)$. We will show that $F(\alpha)$ is an ∞-connective morphism in $\mathcal{S}$, hence an equivalence (since the ∞-topos $\mathcal{S}$ is hypercomplete). For this, it suffices to show that for each $n \geq 0$, the composite functor

$$\mathcal{S}\mathrm{hv}(X) \xrightarrow{F} \mathcal{S} \xrightarrow{\tau^{\mathcal{S}}_{\leq n}} \tau_{\leq n} \mathcal{S}$$

carries α to an equivalence. Since $\tau_{\leq n} \mathcal{S}$ is an n-category, the functor $\tau^{\mathcal{S}}_{\leq n} \circ F$ is equivalent to a composition

$$\mathcal{S}\mathrm{hv}(X) \xrightarrow{\tau^{\mathcal{S}\mathrm{hv}(X)}_{\leq n}} \tau_{\leq n} \mathcal{S}\mathrm{hv}(X) \xrightarrow{F_n} \tau_{\leq n} \mathcal{S}\,.$$

We now observe that $\tau^{\mathcal{S}\mathrm{hv}(X)}_{\leq n}(\alpha)$ is an equivalence, since α is assumed to be ∞-connective. □

We now have the tools in place to complete the proof of our main result.

Proof of Theorem A.3.1. Passing to nerves, we obtain a diagram of ∞-categories $\overline{p} : \mathrm{N}(\mathcal{C})^{\triangleright} \to \mathcal{S}$. In view of Theorem HTT.4.2.4.1 , it will suffice to show that $\overline{p}$ is a colimit diagram. Note that $\overline{p}$ is equivalent to the composition

$$\mathrm{N}(\mathcal{C})^{\triangleright} \xrightarrow{\overline{\chi}} \mathrm{N}(\mathcal{U}(X)) \xrightarrow{j} \mathcal{S}\mathrm{hv}(X)^{\mathrm{hyp}} \xrightarrow{F} \mathcal{S},$$

where $\mathcal{S}\mathrm{hv}(X)^{\mathrm{hyp}}$ denotes the full subcategory of $\mathcal{P}(\mathcal{U}(X))$ spanned by the hypercomplete sheaves on X, j denotes the Yoneda embedding, and F is defined as in Remark A.3.8. Using Proposition A.3.2 and Lemma A.3.10, we deduce that F preserves small colimits. It therefore suffices to show that $j \circ \overline{\chi}$ is a colimit diagram. Since $\mathcal{S}\mathrm{hv}(X)^{\mathrm{hyp}}$ is hypercomplete, it suffices to show that the composition $f^* \circ j \circ \overline{\chi}$ is a colimit diagram, where $f : \{x\} \hookrightarrow X$ is the inclusion of any point into X. This follows immediately from assumption $(*)$. □

A.4 Singular Shape

In §A.1, we defined the notion of a *locally constant* object of an ∞-topos $\mathcal{X}$. Moreover, we proved that the ∞-topos $\mathcal{X}$ is locally of constant shape, then the ∞-category of locally constant objects of $\mathcal{X}$ is equivalent to the ∞-topos $\mathcal{S}_{/K}$ of spaces lying over some fixed object $K \in \mathcal{S}$ (Theorem A.1.15). This can be regarded as an analogue of the main result in the theory of covering spaces, which asserts that the category of covering spaces of a sufficiently nice topological space X can be identified with the category of sets acted on by the fundamental group of X. If we apply Theorem A.1.15 in the special case $\mathcal{X} = \mathcal{S}\mathrm{hv}(X)$, then we deduce that the fundamental groups of X and K are isomorphic to one another. Our objective in this section is to strengthen this observation: we will show that if X is a sufficiently nice topological space, then the ∞-topos $\mathcal{S}\mathrm{hv}(X)$ of sheaves on X is locally of constant shape, and the shape K of $\mathcal{S}\mathrm{hv}(X)$ can be identified with the singular complex $\mathrm{Sing}(X)$.

Remark A.4.1. We refer the reader to [147] for a closely related discussion, at least in the case where X is a CW complex.

Our first step is to describe a class of topological spaces X for which the theory of locally constant sheaves on X is well-behaved. By definition, if $\mathcal{F}$ is a locally constant sheaf on X, then every point $x \in X$ has an open neighborhood U such that the restriction $\mathcal{F}|U$ is constant. Roughly speaking, we want a condition on X which guarantees that we can choose U to be independent of $\mathcal{F}$.

Definition A.4.2. Let $f^* : \mathcal{X} \to \mathcal{Y}$ be a geometric morphism of ∞-topoi. We will say that f^* is a *shape equivalence* if it induces an equivalence of functors $\pi_* \pi^* \to \pi_* f_* f^* \pi^*$, where $\pi^* : \mathcal{S} \to \mathcal{X}$ is a geometric morphism.

Remark A.4.3. Let $\mathcal{X}$ be an ∞-topos. Then $\mathcal{X}$ has constant shape if and only if there exists a shape equivalence $f^* : \mathcal{S}_{/K} \to \mathcal{X}$, for some Kan complex K. The "if" direction is obvious (since $\mathcal{S}_{/K}$ is of constant shape). Conversely, if $\mathcal{X}$ is of constant shape, then $\pi_* \pi^*$ is corepresentable by some object $K \in \mathcal{S}$. In particular, there is a canonical map $\Delta^0 \to \pi_* \pi^* K$, which we can identify with a map $\alpha : \mathbf{1} \to \pi^* K$ in the ∞-topos $\mathcal{X}$, where $\mathbf{1}$ denotes the final object of $\mathcal{X}$. According to Proposition HTT.6.3.5.5 , α determines a geometric morphism of ∞-topoi $f^* : \mathcal{S}_{/K} \to \mathcal{X}$, which is easily verified to be a shape equivalence.

Definition A.4.4. Let $f : X \to Y$ be a continuous map of topological spaces. We will say that f is a *shape equivalence* if the associated geometric morphism $f^* \mathcal{S}\mathrm{hv}(X) \to \mathcal{S}\mathrm{hv}(Y)$ is a shape equivalence, in the sense of Definition A.4.2.

Example A.4.5. Let $f : X \to Y$ be a continuous map between paracompact topological spaces. Then f is a shape equivalence in the sense of Definition A.4.4 if and only if, for every CW complex Z, composition with f induces a homotopy equivalence of Kan complexes $\mathrm{Map}_{\mathcal{T}\mathrm{op}}(Y, Z) \to \mathrm{Map}_{\mathcal{T}\mathrm{op}}(X, Z)$.

小红书
小红书号:3189205503 qq

Example A.4.6. If X is any topological space, then the projection map $\pi : X \times \mathbf{R} \to X$ is a shape equivalence. This follows immediately from the observation that π^* is fully faithful (Example A.2.8).

Remark A.4.7. It follows from Example A.4.6 that every homotopy equivalence of topological spaces is also a shape equivalence.

Warning A.4.8. For general topological spaces, Definition A.4.4 does *not* recover the classical notion of a shape equivalence (see, for example, [104]). However, if X and Y are both paracompact then we recover the usual notion of strong shape equivalence (Remark HTT.7.1.6.7).

Definition A.4.9. Let X be a topological space. We will say that X has *singular shape* if the counit map $|\operatorname{Sing}(X)| \to X$ is a shape equivalence.

Remark A.4.10. If X is a topological space with singular shape, then the ∞-topos $\mathcal{S}\mathrm{hv}(X)$ has constant shape: indeed, $\mathcal{S}\mathrm{hv}(X)$ is shape equivalent to $\mathcal{S}\mathrm{hv}(|\operatorname{Sing}(X)|)$, and $|\operatorname{Sing}(X)|$ is a CW complex (Remark A.1.4).

Remark A.4.11. Let $f : X \to Y$ be a homotopy equivalence of topological spaces. Then X has singular shape if and only if Y has singular shape. This follows immediately from Remark A.4.7 by inspecting the diagram

$$\begin{array}{ccc} |\operatorname{Sing}(X)| & \longrightarrow & |\operatorname{Sing}(Y)| \\ \downarrow & & \downarrow \\ X & \longrightarrow & Y. \end{array}$$

Example A.4.12. Let X be a paracompact topological space. Then X has singular shape if and only if, for every CW complex Y, the canonical map

$$\operatorname{Map}_{\mathcal{T}\mathrm{op}}(X, Y) \to \operatorname{Map}_{\mathcal{S}\mathrm{et}_\Delta}(\operatorname{Sing}(X), \operatorname{Sing}(Y)) \simeq \operatorname{Map}_{\mathcal{T}\mathrm{op}}(|\operatorname{Sing}(X)|, Y)$$

is a homotopy equivalence of Kan complexes.

Remark A.4.13. Let X be a paracompact topological space. There are two different ways that we might try to assign to X a homotopy type. The first is to consider continuous maps from nice spaces (such as CW complexes) *into* the space X. Information about such maps is encoded in the Kan complex $\operatorname{Sing}(X) \in \mathcal{S}$, which controls the *weak homotopy type* of X. Alternatively, we can instead consider maps from X into CW complexes. These are controlled by the pro-object $\mathrm{Sh}(X)$ of $\mathcal{S}$ which corepresents the functor $K \mapsto \operatorname{Map}_{\mathcal{T}\mathrm{op}}(X, |K|)$. There is a canonical map $\operatorname{Sing}(X) \to \mathrm{Sh}(X)$, and X has singular shape if and only if this map is an equivalence.

Lemma A.4.14. Let X be a topological space, and let $\{U_\alpha \in \mathcal{U}(X)\}_{\alpha \in A}$ be an open covering of X. Assume that for every nonempty finite subset $A_0 \subseteq A$, the intersection $U_{A_0} = \bigcap_{\alpha \in A_0} U_\alpha$ has singular shape. Then X has singular shape.

小红书
小红书号:3189205503 qq

Proof. Let $\pi^* : \mathcal{S} \to \mathcal{S}\mathrm{hv}(X)$ be a geometric morphism. For each open set $U \subseteq X$, let $F_U : \mathcal{S} \to \mathcal{S}$ be the functor given by composing π^* with evaluation at U, and let $G_U : \mathcal{S} \to \mathcal{S}$ be the functor given by $K \mapsto \mathrm{Fun}(\mathrm{Sing}(U), K)$. There is a natural transformation of functors $\gamma_U : F_U \to G_U$, and U has singular shape if and only if γ_U is an equivalence. We observe that F_X can be identified with a limit of the diagram $\{F_{U_{A_0}}\}$ where A_0 ranges over the finite subsets of A, and that G_X can be identified with a limit of the diagram $\{G_{U_{A_0}}\}$ (since $\mathrm{Sing}(X)$ is the homotopy colimit of $\{\mathrm{Sing}(U_{A_0})\}$ by Theorem A.3.1). Under these identifications, γ_X is a limit of the functors $\{\gamma_{U_{A_0}}\}$. Since each of these functors is assumed to be an equivalence, we deduce that γ_X is an equivalence. □

Definition A.4.15. We will say that topological space X is *locally of singular shape* if every open set $U \subseteq X$ has singular shape.

Remark A.4.16. Let X be a topological space. Suppose that X admits a covering by open sets which are locally of singular shape. Then X is locally of singular shape (this follows immediately from Lemma A.4.14).

Let X be a topological space which is locally of singular shape. Then $\mathcal{S}\mathrm{hv}(X)$ is locally of constant shape, and the shape of $\mathcal{S}\mathrm{hv}(X)$ can be identified with the Kan complex $\mathrm{Sing}(X)$. It follows from Theorem A.1.15 that the ∞-category of locally constant objects of $\mathcal{S}\mathrm{hv}(X)$ is equivalent to $\mathcal{S}_{/\mathrm{Sing}(X)}$. Our goal for the remainder of this section is to give a more explicit description of this equivalence.

Construction A.4.17. Let X be a topological space. We let $\mathbf{A}_X$ denote the category $(\mathcal{S}\mathrm{et}_\Delta)_{/\mathrm{Sing}(X)}$, endowed with the usual model structure. Let $\mathbf{A}_X^\circ$ denote the full subcategory of $\mathbf{A}_X$ spanned by the fibrant-cofibrant objects (these are precisely the Kan fibrations $Y \to \mathrm{Sing}(X)$).

We define a functor $\theta : \mathcal{U}(X)^{op} \times \mathbf{A}_X \to \mathcal{S}\mathrm{et}_\Delta$ by the formula $\theta(U, Y) = \mathrm{Fun}_{\mathrm{Sing}(X)}(\mathrm{Sing}(U), Y)$. Restricting to $\mathbf{A}_X^\circ$ and passing to nerves, we get a map of ∞-categories $\mathrm{N}(\mathcal{U}(X)^{op}) \times \mathrm{N}(\mathbf{A}_X^\circ) \to \mathcal{S}$, which we regard as a map of ∞-categories $\mathrm{N}(\mathbf{U}_X^\circ) \to \mathcal{P}(\mathcal{U}(X))$. It follows from Variant A.3.7 on Proposition A.3.2 that this functor factors through the full subcategory $\mathcal{S}\mathrm{hv}(X) \subseteq \mathcal{P}(\mathcal{U}(X))$ spanned by the sheaves on X. We will denote the underlying functor $\mathrm{N}(\mathbf{A}_X^\circ) \to \mathcal{S}\mathrm{hv}(X)$ by Ψ_X.

Example A.4.18. Let X be a topological space. The construction $K \mapsto K \times \mathrm{Sing}(X)$ determines a functor from $\mathcal{S}\mathrm{et}_\Delta \simeq \mathbf{A}_*$ to $\mathbf{A}_X$, which restricts to a functor $\mathbf{A}_*^\circ \to \mathbf{A}_X^\circ$. Passing to nerves and composing with Ψ_X, we get a functor $\psi : \mathcal{S} \to \mathcal{S}\mathrm{hv}(X)$, which carries a Kan complex K to the sheaf $U \mapsto \mathrm{Map}_{\mathcal{S}\mathrm{et}_\Delta}(\mathrm{Sing}(U), K)$. Let $\pi_* : \mathcal{S}\mathrm{hv}(X) \to \mathcal{S}$ be the functor given by evaluation on X. There is an evident natural transformation $\mathrm{id}_{\mathcal{S}} \to \pi_* \circ \psi$, which induces a natural transformation $\pi^* \to \psi$. The space X is locally of singular shape if and only if this natural transformation is an equivalence.

We note that the object $\psi\,\mathrm{Sing}(X) \in \mathcal{S}\mathrm{hv}(X)$ has a canonical global section given by the identity map from $\mathrm{Sing}(X)$ to itself. If $Y \to \mathrm{Sing}(X)$ is any Kan fibration, then $\Psi_X(Y)$ can be identified

小红书
小红书号:3189205503 qq

with the (homotopy) fiber of the induced map $\psi(Y) \to \psi(\mathrm{Sing}(X))$. It follows that the functor Ψ_X is an explicit model for the fully faithful embedding described in Proposition A.1.11. Coupling this observation with Theorem A.1.15, we obtain the following:

Theorem A.4.19. Let X be a topological space which is locally of singular shape. Then the functor $\Psi_X : \mathrm{N}(\mathbf{A}^{\circ}_X) \to \mathcal{S}\mathrm{hv}(X)$ is a fully faithful embedding, whose essential image is the full subcategory of $\mathcal{S}\mathrm{hv}(X)$ spanned by the locally constant sheaves on X.

A.5 Constructible Sheaves

In §A.1 and §A.4, we studied the theory of *locally constant* sheaves on a topological space X. In many applications, one encounters sheaves $\mathcal{F} \in \mathcal{S}\mathrm{hv}(X)$ which are not locally constant but are nevertheless *constructible*: that is, they are locally constant along each stratum of a suitable stratification of X. We begin by making this notion more precise.

Definition A.5.1. Let A be a partially ordered set. We will regard A as a topological space, where a subset $U \subseteq A$ is open if it is *closed upwards*: that is, if $x \leq y$ and $x \in U$ implies that $y \in U$.

Let X be a topological space. An *A-stratification* of X is a continuous map $f : X \to A$. Given an A-stratification of a space X and an element $a \in A$, we let X_a, $X_{\leq a}$, $X_{<a}$, $X_{\geq a}$, and $X_{>a}$ denote the subsets of X consisting of those points $x \in X$ such that $f(x) = a$, $f(x) \leq a$, $f(x) < a$, $f(x) \geq a$, and $f(x) > a$, respectively.

Definition A.5.2. Let A be a partially ordered set and let X be a topological space equipped with an A-stratification. We will say that an object $\mathcal{F} \in \mathcal{S}\mathrm{hv}(X)$ is *A-constructible* if, for every element $a \in A$, the restriction $\mathcal{F}|X_a$ is a locally constant object of $\mathcal{S}\mathrm{hv}(X_a)$. Here $\mathcal{F}|X_a$ denotes the image of $\mathcal{F}$ under the left adjoint to the pushforward functor $\mathcal{S}\mathrm{hv}(X_a) \to \mathcal{S}\mathrm{hv}(X)$.

We let $\mathcal{S}\mathrm{hv}^A(X)$ denote the full subcategory of $\mathcal{S}\mathrm{hv}(X)$ spanned by the A-constructible objects.

To ensure that the theory of A-constructible sheaves is well-behaved, we introduce a regularity condition on the stratification $X \to A$.

Definition A.5.3. Let A be a partially ordered set, and let $A^{\triangleleft}$ be the partially ordered set obtained by adjoining a new smallest element $-\infty$ to A. Let $f : X \to A$ be an A-stratified space. We define a new $A^{\triangleleft}$-stratified space $C(X)$ as follows:

(1) As a set $C(X)$ is given by the union $\{*\} \cup (X \times \mathbf{R}_{>0})$.

(2) A subset $U \subseteq C(X)$ is open if and only if $U \cap (X \times \mathbf{R}_{>0})$ is open, and if $* \in U$ then $X \times (0, \epsilon) \subseteq U$ for some positive real number ϵ.

(3) The $A^{\triangleleft}$-stratification of $C(X)$ is determined by the map $\overline{f} : C(X) \to A^{\triangleleft}$ such that $\overline{f}(*) = -\infty$ and $\overline{f}(x, t) = f(x)$ for $(x, t) \in X \times \mathbf{R}_{>0}$.

小红书
小红书号:3189205503 qq

We will refer to $C(X)$ as the *open cone* on X.

Remark A.5.4. If the topological space X is compact and Hausdorff, then the open cone $C(X)$ is homeomorphic to the pushout $(X \times \mathbf{R}_{\geq 0}) \coprod_{X \times \{0\}} \{*\}$.

Definition A.5.5. Let A be a partially ordered set, let X be an A-stratified space, and let $x \in X_a \subseteq X$ be a point of X. We will say that X is *conically stratified at the point x* if there exists an $A_{>a}$-stratified topological space Y, a topological space Z, and an open embedding $Z \times C(Y) \hookrightarrow X$ of A-stratified spaces whose image U_x contains x. Here we regard $Z \times C(Y)$ as endowed with the A-stratification determined by the $A^{\triangleleft}_{>a} \simeq A_{\geq a}$-stratification of $C(Y)$.

We will say that X is *conically stratified* if it is conically stratified at every point $x \in X$.

Remark A.5.6. In Definition A.5.5, we do not require that the space Y itself be conically stratified.

Definition A.5.7. We will say that a partially ordered set A satisfies the *ascending chain condition* if every nonempty subset of A has a maximal element.

Remark A.5.8. Equivalently, A satisfies the ascending chain condition if there does not exist any infinite ascending sequence $a_0 < a_1 < \cdots$ of elements of A.

The main goal of this section is to prove the following somewhat technical convergence result concerning constructible sheaves:

Proposition A.5.9. Let A be a partially ordered set, and let X be an A-stratified space. Assume that:

(i) The space X is paracompact and locally of singular shape.

(ii) The A-stratification of X is conical.

(iii) The partially ordered set A satisfies the ascending chain condition.

Let $\mathcal{F} \in \mathcal{S}\mathrm{hv}^A(X)$ be an A-constructible sheaf. Then the canonical map $\theta : \mathcal{F} \to \varprojlim \tau_{\leq n} \mathcal{F}$ is an equivalence. In particular, $\mathcal{F}$ is hypercomplete.

The proof of Proposition A.5.9 will require several preliminaries, and will be given at the end of this section. Our first step is to consider the case of a very simple stratification of X: namely, a decomposition of X into an open set and its closed complement. The following result is useful for working with constructible sheaves: it allows us to reduce global questions to questions which concern individual strata.

Lemma A.5.10. Let $\mathcal{X}$ be an ∞-topos and U a (-1)-truncated object of $\mathcal{X}$. Let $i^* : \mathcal{X} \to \mathcal{X}/U$ and $j^* : \mathcal{X} \to \mathcal{X}_{/U}$ be the canonical geometric morphisms, j_* a right adjoint to j^*, and let $\overline{p} : K^{\triangleleft} \to \mathcal{X}$ be a small diagram in $\mathcal{X}$ indexed by a weakly contractible simplicial set K. Suppose that $i^*\overline{p}$, $j^*\overline{p}$, and $i^* j_* j^* \overline{p}$ are all limit diagrams. Then $\overline{p}$ is a limit diagram.

小红书
小红书号:3189205503 qq

Proof. Let $\mathcal{F}$ denote the image of the cone point of $K^{\triangleleft}$ under $\overline{p}$, let $p' : K \to \mathcal{X}$ be the constant diagram taking the value $\mathcal{F}$, and let $p = \overline{p}|K$. Then $\overline{p}$ determines a natural transformation of diagrams $\alpha : p' \to p$; we wish to prove that α induces an equivalence $\varprojlim(p') \to \varprojlim(p)$ in $\mathcal{X}$. For this, it suffices to show that for every object $V \in \mathcal{X}$, the induced map

$$\theta : \mathrm{Map}_{\mathcal{X}}(V, \varprojlim(p')) \to \mathrm{Map}_{\mathcal{X}}(V, \varprojlim(p))$$

is a homotopy equivalence. Replacing $\mathcal{X}$ by $\mathcal{X}_{/V}$, we can reduce to the case where V is the final object of $\mathcal{X}$. In this case, we let Γ denote the functor $\mathcal{X} \to \mathcal{S}$ corepresented by V (the functor of global sections).

Fix a point $\eta \in \Gamma(\varprojlim(p))$; we will show that the homotopy fiber of θ over η is contractible. Let j_* denote a right adjoint to j^*, let $q = j_* \circ j^* \circ p$, and let $q' = j_* \circ j^* \circ p'$. Then η determines a point $\eta_0 \in \Gamma(\varprojlim(q))$. Since $j^* \circ \overline{p}$ is a limit diagram (and the functor j_* preserves limits), the canonical map $\varprojlim(q') \to \varprojlim(q)$ is an equivalence, so we can lift η_0 to a point $\eta_1 \in \Gamma(\varprojlim(q'))$. This point determines a natural transformation from the constant diagram $c : K \to \mathcal{X}$ taking the value $V \simeq \mathbf{1}$ to the diagram q'. Let $p'_0 = c \times_{q'} p'$ and let $p_0 = c \times_q p$. We have a map of homotopy fiber sequences

$$\begin{array}{ccccc} \Gamma(\varprojlim(p'_0)) & \longrightarrow & \Gamma(\varprojlim(p')) & \longrightarrow & \Gamma(\varprojlim(q')) \\ \downarrow{\scriptstyle \theta'} & & \downarrow{\scriptstyle \theta} & & \downarrow{\scriptstyle \theta''} \\ \Gamma(\varprojlim(p_0)) & \longrightarrow & \Gamma(\varprojlim(p)) & \longrightarrow & \Gamma(\varprojlim(q)). \end{array}$$

Here θ'' is a homotopy equivalence. Consequently, to prove that the homotopy fiber of θ is contractible, it will suffice to show that θ' is a homotopy equivalence.

By construction, the diagrams p'_0 and p_0 take values in the full subcategory $\mathcal{X}/U \subseteq \mathcal{X}$, so that the localization maps $p'_0 \to i^* p'_0$ and $p_0 \to i^* p_0$ are equivalences. It therefore suffices to show that the map $\Gamma(\varprojlim(i^* p'_0)) \to \Gamma(\varprojlim(i^* p_0))$ is a homotopy equivalence. We have another map of homotopy fiber sequences

$$\begin{array}{ccccc} \Gamma(\varprojlim(i^* p'_0)) & \longrightarrow & \Gamma(\varprojlim(i^* p')) & \longrightarrow & \Gamma(\varprojlim(i^* q')) \\ \downarrow{\scriptstyle \psi'} & & \downarrow{\scriptstyle \psi} & & \downarrow{\scriptstyle \psi''} \\ \Gamma(\varprojlim(i^* p_0)) & \longrightarrow & \Gamma(i^* \varprojlim(p)) & \longrightarrow & \Gamma(\varprojlim(i^* q)). \end{array}$$

The map ψ is a homotopy equivalence by virtue of our assumption that $i^* \overline{p}$ is a limit diagram, and the map ψ'' is a homotopy equivalence by virtue of our assumption that $i^* j_* j^* \overline{p}$ is a limit diagram. It follows that ψ' is also a homotopy equivalence, as desired. □

Lemma A.5.11. Let $\mathcal{X}$ be an ∞-topos and U a (-1)-truncated object of $\mathcal{X}$. Let $i^* : \mathcal{X} \to \mathcal{X}/U$ and $j^* : \mathcal{X} \to \mathcal{X}_{/U}$ be the canonical geometric morphisms, and let $\alpha : \mathcal{F} \to \mathcal{G}$ be a morphism in $\mathcal{X}$. Suppose that $i^*(\alpha)$ and $j^*(\alpha)$ are equivalences. Then α is an equivalence.

小红书
小红书号:3189205503 qq

Proof. Apply Lemma A.5.10 in the special case where $K = \Delta^0$ (note that $i^* j_*$ automatically preserves j-indexed limits). □

Lemma A.5.12. Let X be a paracompact topological space, Y any topological space, V an open neighborhood of X in $X \times C(Y)$. Then there exists a continuous function $f : X \to (0, \infty)$ such that V contains

$$V_f = \{(x, y, t) : t < f(x)\} \subseteq X \times Y \times (0, \infty) \subseteq X \times C(Y).$$

Proof. For each point $x \in X$, there exists a neighborhood U_x of x and a real number t_x such that $\{(x', y, t) : t < t_x \wedge x' \in U_x\} \subseteq V$. Since X is paracompact, we can choose a locally finite partition of unity $\{\psi_x\}_{x \in X}$ subordinate to the cover $\{U_x\}_{x \in X}$. We now define $f(y) = \sum_{x \in X} \psi_x(y) t_x$. □

Remark A.5.13. In the situation of Lemma A.5.12, the collection of open sets of the form V_f is nonempty (take f to be a constant function) and stable under pairwise intersections ($V_f \cap V_g = V_{\inf\{f,g\}}$). The collection of such open sets is therefore cofinal in partially ordered set of all open subsets of $X \times C(Y)$ which contain X (ordered by reverse inclusion).

Lemma A.5.14. Let X be a paracompact topological space. Let π denote the projection $X \times [0, \infty) \to X$, let j denote the inclusion $X \times (0, \infty) \hookrightarrow X \times [0, \infty)$, and let $\pi_0 = \pi \circ j$. Then the obvious equivalence $\pi_0^* \simeq j^* \pi^*$ is adjoint to an equivalence of functors $\alpha : \pi^* \to j_* \pi_0^*$ from $\mathcal{S}\mathrm{hv}(X)$ to $\mathcal{S}\mathrm{hv}(X \times [0, \infty))$.

Proof. Let $\mathcal{F} \in \mathcal{S}\mathrm{hv}(X)$; we wish to prove that α induces an equivalence $\pi^* \mathcal{F} \to j_* \pi_0^* \mathcal{F}$. It is clear that this map is an equivalence when restricted to the open set $X \times (0, \infty)$. Let $i : X \to X \times [0, \infty)$ be the map induced by the inclusion $\{0\} \subseteq [0, \infty)$. By Corollary A.5.11, it will suffice to show that the map

$$\beta : \mathcal{F} \simeq i^* \pi^* \mathcal{F} \to i^* j_* \pi_0^* \mathcal{F}$$

determined by α is an equivalence. Let U be an open F_σ subset of X; we will show that the map $\beta_U : \mathcal{F}(U) \to (i^* j_* \pi_0^* \mathcal{F})(U)$ is a homotopy equivalence. Replacing X by U, we can assume that $U = X$.

According to Corollary HTT.7.1.5.6 , we can identify $(i^* j_* \pi_0^* \mathcal{F})(X)$ with the colimit $\varinjlim_{V \in S} (j_* \pi_0^* \mathcal{F})(V) \simeq \varinjlim_{V \in S} (\pi_0^* \mathcal{F})(V - X)$, where V ranges over the collection S of all open neighborhoods of $X = X \times \{0\}$ in $X \times [0, \infty)$. Let $S' \subseteq S$ be the collection of all open neighborhoods of the form $V_f = \{(x, t) : t < f(x)\}$, where $f : X \to (0, \infty)$ is a continuous function (see Lemma A.5.12). In view of Remark A.5.13, we have an equivalence $\varinjlim_{V \in S} (\pi_0^* \mathcal{F})(V - X) \simeq \varinjlim_{V \in S'} (\pi_0^* \mathcal{F})(V - X)$. Since S' is a filtered partially ordered set (when ordered by reverse inclusion), to prove that β_X is an equivalence it suffices to show that the pullback map $\mathcal{F}(X) \to (\pi_0^* \mathcal{F})(V_f - X)$ is a homotopy equivalence, for every continuous map $f : X \to (0, \infty)$. Division by f determines a homeomorphism $V_f - X \to X \times (0, 1)$, and the desired result follows from Lemma A.2.9. □

小红书
小红书号:3189205503 qq

Lemma A.5.15. Let X be a paracompact topological space of the form $Z \times C(Y)$, and consider the (noncommuting) diagram

$$\begin{array}{ccccc} Z \times Y \times (0,\infty) & \xrightarrow{j} & Z \times Y \times [0,\infty) & \xrightarrow{k} & X \\ & \searrow^{\pi_0} & \downarrow{\scriptstyle \pi} & & \uparrow{\scriptstyle i} \\ & & Z \times Y & \xrightarrow{\psi} & Z. \end{array}$$

Let i' denote the inclusion $Z \times Y \to Z \times Y \times [0,\infty)$ given by $\{0\} \hookrightarrow [0,\infty)$. Assume that X is paracompact. Then:

(*i*) The canonical map $\alpha : \pi^* \to j_* \pi_0^*$ is an equivalence of functors from $\mathcal{S}\mathrm{hv}(Z \times Y)$ to $\mathcal{S}\mathrm{hv}(Z \times Y \times [0,\infty))$.

(*ii*) Let $\beta : \pi^* \to i'_*$ be the natural transformation adjoint to the equivalence $i'^* \pi^* \simeq \mathrm{id}_{\mathcal{S}\mathrm{hv}(Z \times Y)}$. Then the natural transformation

$$\gamma : i^* k_* \pi^* \xrightarrow{\beta} i^* k_* i'_* \simeq i^* i_* \psi_* \to \psi_*$$

is an equivalence of functors from $\mathcal{S}\mathrm{hv}(Z \times Y)$ to $\mathcal{S}\mathrm{hv}(Z)$.

(*iii*) The functor $i^* j_* \pi_0^*$ is equivalent to ψ_*.

Proof. Note that $Z \times Y \simeq Z \times Y \times \{1\}$ can be identified with a closed subset of X, and is therefore paracompact. Consequently, assertion (*i*) follows from Lemma A.5.14. Assertion (*iii*) follows immediately from (*i*) and (*ii*). It will therefore suffice to prove (*ii*).

Since Z can be identified with a closed subset of X, it is paracompact. Let $\mathcal{F} \in \mathcal{S}\mathrm{hv}(Z \times Y)$, and let U be an open F_σ subset of Z. We will show that γ induces a homotopy equivalence $(i^* k_* \pi^* \mathcal{F})(U) \to (\psi_* \mathcal{F})(U)$. Shrinking Z if necessary, we may suppose that $Z = U$. The right hand side can be identified with $\mathcal{F}(Z \times Y)$, while the left hand side is given (by virtue of Corollary HTT.7.1.5.6) by the colimit $\varinjlim_{V \in S} (\pi^* \mathcal{F})(k^{-1} V)$, where V ranges over partially ordered set S of open subsets of $Z \times C(Y)$ which contain Z. By virtue of Remark A.5.13, we can replace S by the cofinal subset S' consisting of open sets of the form $V = V_f$, where $f : Z \to (0,\infty)$ is a continuous function (see Lemma A.5.12). Since S' is filtered, it will suffice to show that each of the maps $(\pi^* \mathcal{F})(k^{-1} V) \to \mathcal{F}(Z \times Y)$ is an equivalence. Division by f allows us to identify $(\pi^* \mathcal{F})(k^{-1} V)$ with $(\pi^* \mathcal{F})(Z \times Y \times [0,1))$, and the desired result now follows from Variant A.2.10 on Lemma A.2.9. □

Lemma A.5.16. Let X be a paracompact space equipped with a conical A-stratification. Then every point $x \in X_a$ admits a open F_σ neighborhood V which is homeomorphic (as an A-stratified space) to $Z \times C(Y)$, where Y is some $A_{>a}$-stratified space.

Proof. Since the stratification of X is conical, there exists an open neighborhood U of x which is homeomorphic (as an A-stratified space) to $Z \times C(Y)$, where Y is some $A_{>a}$-stratified space. The

小红书 小红书号:3189205503 qq

open set U need not be paracompact. However, there exists a smaller open set $U' \subseteq U$ containing x such that U' is an F_σ subset of X, and therefore paracompact. let $Z' = U' \cap Z$. Then Z' is a closed subset of the paracompact space U', and therefore paracompact. Replacing Z by Z', we can assume that Z is paracompact. Applying Lemma A.5.12, we deduce that there exists a continuous function $f : Z \to (0, \infty)$ such that $V_f \subseteq U$ (see Lemma A.5.12 for an explanation of this notation). The set V_f is the union of the closures in U' of the open sets $\{V_{\frac{n}{n+1}f}\}_{n>0}$. It is therefore an open F_σ subset of U' (and so also an F_σ subset of the space X). We conclude by observing that V_f is again homeomorphic to the product $Z \times C(Y)$. □

Remark A.5.17. If A is a partially ordered set satisfying the ascending chain condition, then we can define an ordinal-valued rank function rk on A. The function rk is uniquely determined by the following requirement: for every element $a \in A$, the rank $\mathrm{rk}(a)$ is the smallest ordinal not of the form $\mathrm{rk}(b)$, where $b > a$. More generally, suppose that X is an A-stratified topological space. We define the *rank* of X to be the supremum of the set of ordinals $\{\mathrm{rk}(a) : X_a \neq \emptyset\}$.

Remark A.5.18. Let X be a paracompact topological space of the form $Z \times C(Y)$. Then Z is paracompact (since it is homeomorphic to a closed subset of X). Suppose that X has singular shape. Since the inclusion $Z \hookrightarrow X$ is a homotopy equivalence, we deduce also that Z has singular shape (Remark A.4.11). The same argument shows that if X is locally of singular shape, then Z is locally of singular shape.

Proof of Proposition A.5.9. The assertion that $\theta : \mathcal{F} \to \varprojlim \tau_{\leq n} \mathcal{F}$ is an equivalence is local on X. It will therefore suffice to prove that every point $x \in X_a$ admits an open F_σ neighborhood U such that θ is an equivalence over U. Since A satisfies the ascending chain condition, we may assume without loss of generality that the same result holds for every point $x' \in X_{>a}$. Using Lemma A.5.16, we may assume without loss of generality that U is a paracompact open set of the form $Z \times C(Y)$, where Y is some $A_{>a}$-stratified space.

Let $i : Z \to Z \times C(Y)$ and $j : Z \times Y \times (0, \infty) \to Z \times C(Y)$ denote the inclusion maps. According to Lemma A.5.10, it will suffice to verify the following:

(a) The canonical map $i^* \mathcal{F} \to \varprojlim i^* \tau_{\leq n} \mathcal{F} \simeq \varprojlim \tau_{\leq n} i^* \mathcal{F}$ is an equivalence.

(b) The canonical map $j^* \mathcal{F} \to \varprojlim j^* \tau_{\leq n} \mathcal{F} \simeq \varprojlim \tau_{\leq n} j^* \mathcal{F}$ is an equivalence.

(c) The canonical map $i^* j_* j^* \mathcal{F} \to \varprojlim i^* j_* j^* \tau_{\leq n} \mathcal{F}$ is an equivalence.

Assertion (a) follows from Corollary A.1.17 (note that Z is locally of singular shape by Remark A.5.18), and assertion (b) follows from the inductive hypothesis. To prove (c), let $\pi : Z \times Y \times (0, \infty)$ denote the projection. Using the inductive hypothesis, we deduce that $j^* \mathcal{F}$ is hypercomplete. Since each fiber $\{z\} \times \{y\} \times (0, \infty)$ is contained in a stratum of X, we deduce that $j^* \mathcal{F}$ is foliated, so that the counit map $\pi^* \pi_* j^* \mathcal{F} \to j^* \mathcal{F}$ is an equivalence. The same reasoning shows that $\pi^* \pi_* j^* \tau_{\leq n} \mathcal{F} \to$

小红书
小红书号:3189205503 qq

$j^* \tau_{\leq n} \mathcal{F}$ is an equivalence for each $n \geq 0$. Consequently, (c) is equivalent to the assertion that the canonical map

$$i^* j_* \pi^* \mathcal{G} \to \varprojlim i^* j_* \pi^* \mathcal{G}_n$$

is an equivalence, where $\mathcal{G} = \pi_* j^* \mathcal{F}$ and $\mathcal{G}_n = \pi_* j^* \tau_{\leq n} \mathcal{F}$. Since the functor π_* preserves limits, the canonical map $\mathcal{G} \to \varprojlim \mathcal{G}_n$ is an equivalence by virtue of (b). The desired result now follows from the fact that the functor $i^* j_* \pi^*$ is equivalent to π_*, and therefore preserves limits (Lemma A.5.15). $\square$

Remark A.5.19. Let X be a paracompact topological space equipped with a conical A-stratification, where A is a partially ordered set which satisfies the ascending chain condition. Suppose that each stratum X_a is locally of singular shape. Then X is locally of singular shape. To prove this, it suffices to show that X has a covering by open sets which are locally of singular shape (Remark A.4.16). Using Lemma A.5.16, we may reduce to the case where $X = Z \times C(Y)$, where Y is some $A_{>a}$-stratified space and $Z \times C(Y)$ is endowed with the induced $A_{\geq a}$-stratification. Working by induction on a, we may suppose that $X - Z \simeq Z \times Y \times (0, \infty)$ is locally of singular shape. Let U be an open F_σ subset of X and let $U_0 = U \cap Z$. We wish to prove that U is locally of singular shape. Using Lemma A.5.12, we deduce that there exists a continuous map $f : U_0 \to (0, \infty)$ such that U contains the open set $V_f = U_0 \cup \{(z, y, t) \in U_0 \times Y \times (0, \infty) : t < f(z)\}$. Then U is covered by the open subsets V_f and $U - U_0$. According to Lemma A.4.14, it suffices to show that V_f, $U - U_0$, and $V_f \cap (U - U_0)$ are of singular shape. The open sets $U - U_0$ and $V_f \cap (U - U_0)$ belong to $X_{>a}$ and are therefore of singular shape by the inductive hypothesis. The open set V_f is homotopy equivalent to U_0, and thus has singular shape by virtue of our assumption that X_a is locally shapely (Remark A.4.11).

A.6 ∞-Categories of Exit Paths

If X is a sufficiently nice topological space, then Theorem A.4.19 guarantees that the ∞-category of locally constant sheaves on X can be identified with the ∞-category $\mathcal{S}_{/\operatorname{Sing}(X)} \simeq \operatorname{Fun}(\operatorname{Sing}(X), \mathcal{S})$. Roughly speaking, we can interpret a sheaf $\mathcal{F}$ on X as a functor which assigns to each $x \in X$ the stalk $\mathcal{F}_x \in \mathcal{S}$, and to each path $p : [0, 1] \to X$ joining $x = p(0)$ to $y = p(1)$ the homotopy equivalence $\mathcal{F}_x \simeq \mathcal{F}_y$ given by transport along p (see §A.2).

Suppose now that $\mathcal{F}$ is a sheaf on X which is *not* locally constant. In this case, a path $p : [0, 1] \to X$ from $x = p(0)$ to $y = p(1)$ does not necessarily define a transport map $\mathcal{F}_x \to \mathcal{F}_y$. However, every point η_0 in the stalk $\mathcal{F}_x$ can be lifted to a section of $\mathcal{F}$ over some neighborhood of x, which determines points $\eta_t \in \mathcal{F}_{p(t)}$ for t sufficiently small. If we assume that $p^* \mathcal{F}$ is locally constant on the half-open interval $(0, 1]$, then each η_t can be transported to a point in the stalk $\mathcal{F}_y$, and we should again expect to obtain a well-defined map $\mathcal{F}_x \to \mathcal{F}_y$. For example, suppose that $\mathcal{F}$ is a sheaf which is locally constant when restricted to some closed subset $X_0 \subseteq X$, and also when restricted

小红书
小红书号:3189205503 qq

to the open set $X - X_0$. In this case, the above analysis should apply whenever $p^{-1}X_0 = \{0\}$: that is, whenever p is a path which is *exiting* the closed subset $X_0 \subseteq X$. Following a proposal of MacPherson, we might try to identify $\mathcal{F}$ with an $\mathcal{S}$-valued functor defined on some subset of the Kan complex $\mathrm{Sing}(X)$, which allows paths to travel from X_0 to $X - X_0$ but not vice-versa.

Our objective in this section is to introduce a simplicial subset $\mathrm{Sing}^A(X)$ associated to any stratification $f : X \to A$ of a topological space X by a partially ordered set A. Our main result, Theorem A.6.4, asserts that $\mathrm{Sing}^A(X)$ is an ∞-category provided that the stratification of X is conical (Definition A.5.5). In this case, we will refer to $\mathrm{Sing}^A(X)$ as the *∞-category of exit paths in X with respect to the stratification $X \to A$*. In §A.9, we will show that (under suitable hypotheses) the ∞-category of A-constructible sheaves on X is equivalent to the ∞-category of functors $\mathrm{Fun}(\mathrm{Sing}^A(X), \mathcal{S})$.

Remark A.6.1. The exit path ∞-category $\mathrm{Sing}^A(X)$ can be regarded as an ∞-categorical generalization of the 2-category of exit paths constructed in [156].

Definition A.6.2. Let A be a partially ordered set, and let X be a topological space equipped with an A-stratification $f : X \to A$. We $\mathrm{Sing}^A(X) \subseteq \mathrm{Sing}(X)$ to be the simplicial subset consisting of those n-simplices $\sigma : |\Delta^n| \to X$ which satisfy the following condition:

(∗) Let $|\Delta^n| = \{(t_0, \ldots, t_n) \in [0,1]^{n+1} : t_0 + \ldots + t_n = 1\}$. Then there exists a chain $a_0 \leq \ldots \leq a_n$ of elements of A such that for each point $(t_0, \ldots, t_i, 0, \ldots, 0) \in |\Delta^n|$ where $t_i \neq 0$, we have $f(\sigma(t_0, \ldots, t_n)) = a_i$.

Remark A.6.3. Let A be a partially ordered set, regarded as a topological space as in Definition A.5.1. Then there is a natural map of simplicial sets $\mathrm{N}(A) \to \mathrm{Sing}(A)$, which carries an n-simplex $(a_0 \leq \ldots \leq a_n)$ of $\mathrm{N}(A)$ to the map $\sigma : |\Delta^n| \to A$ characterized by the formula

$$\sigma(t_0, \ldots, t_i, 0, \ldots, 0) = a_i$$

whenever $t_i > 0$. For any A-stratified topological space X, the simplicial set $\mathrm{Sing}^A(X)$ can be described as the fiber product $\mathrm{Sing}(X) \times_{\mathrm{Sing}(A)} \mathrm{N}(A)$. In particular, there is a canonical map of simplicial sets $\mathrm{Sing}^A(X) \to \mathrm{N}(A)$.

We can now state our main result as follows:

Theorem A.6.4. Let A be a partially ordered set, and let X be a conically A-stratified topological space. Then:

(1) The projection $\mathrm{Sing}^A(X) \to \mathrm{N}(A)$ is an inner fibration of simplicial sets.

(2) The simplicial set $\mathrm{Sing}^A(X)$ is an ∞-category.

(3) A morphism in $\mathrm{Sing}^A(X)$ is an equivalence if and only if its image in $\mathrm{N}(A)$ is degenerate (in other words, if and only if the underlying path $[0,1] \to X$ is contained in a single stratum).

小红书
小红书号:3189205503 qq

Remark A.6.5. In the situation of Theorem A.6.4, we will refer to the ∞-category $\mathrm{Sing}^A(X)$ as the *∞-category of A-stratified exit paths in X* or simply as the *∞-category of exit paths in X* if the stratification of X is clear from context.

Proof. The implication (1) $\Rightarrow$ (2) is obvious. The "only if" direction of (3) is clear (since any equivalence in $\mathrm{Sing}^A(X)$ must project to an equivalence in $\mathrm{N}(A)$), and the "if" direction follows from the observation that each fiber $\mathrm{Sing}^A(X) \times_{\mathrm{N}(A)} \{a\}$ is isomorphic to the Kan complex $\mathrm{Sing}(X_a)$. It will therefore suffice to prove (1). Fix $0 < i < n$; we wish to prove that every lifting problem of the form

$$\begin{array}{ccc} \Lambda^n_i & \xrightarrow{\sigma_0} & \mathrm{Sing}^A(X) \\ \downarrow & \overset{\sigma}{\nearrow} & \downarrow \\ \Delta^n & \longrightarrow & \mathrm{N}(A) \end{array}$$

admits a solution.

The map $\Delta^n \to \mathrm{N}(A)$ determines a chain of elements $a_0 \leq a_1 \leq \ldots \leq a_n$. Without loss of generality, we may replace A by $A' = \{a_0, \ldots, a_n\}$ and X by $X \times_A A'$. We may therefore assume that A is a finite nonempty linearly ordered set. We now work by induction on the number of elements of A. If A has only a single element, then $\mathrm{Sing}^A(X) = \mathrm{Sing}(X)$ is a Kan complex and there is nothing to prove. Otherwise, there exists some integer $p < n$ such that $a_p = a_0$ and $a_{p+1} \neq a_0$. There are two cases to consider.

(a) Suppose that $p < i < n$. Let $q = n - p - 1$ and let $j = i - p - 1$, so that we have isomorphisms of simplicial sets

$$\Delta^n \simeq \Delta^p \star \Delta^q \qquad \Lambda^n_i \simeq (\Delta^p \star \Lambda^q_{q'}) \coprod_{\partial \Delta^p \star \Lambda^q_j} (\partial \Delta^p \star \Delta^q).$$

We will use the first isomorphism to identify $|\Delta^n|$ with the pushout

$$|\Delta^p| \coprod_{|\Delta^p| \times |\Delta^q| \times \{0\}} (|\Delta^p| \times |\Delta^q| \times [0,1]) \coprod_{|\Delta^p| \times |\Delta^q| \times \{1\}} |\Delta^q|.$$

Let $K \subseteq |\Delta^p| \times |\Delta^q|$ be the union of the closed subsets $|\partial \Delta^p| \times |\Delta^q|$ and $|\Delta^p| \times |\Lambda^q_j|$, so that $|\Lambda^n_i|$ can be identified with the pushout

$$|\Delta^p| \coprod_{|\Delta^p| \times |\Delta^q| \times \{0\}} (K \times [0,1]) \coprod_{|\Delta^p| \times |\Delta^q| \times \{1\}} |\Delta^q|.$$

Let $K' \subseteq |\Delta^p| \times |\Delta^q| \times [0,1]$ be the union of $K \times [0,1]$ with $|\Delta^p| \times |\Delta^q| \times \{0,1\}$. Then σ_0 determines a continuous map $F_0 : K' \to X$. To construct the map σ, we must extend F_0 to a map $F : |\Delta^p| \times |\Delta^q| \times [0,1] \to X$ satisfying the following condition: for every point $s \in (|\Delta^p| \times |\Delta^q| \times [0,1]) - K'$, we have $F(s) \in X_{a_n}$.

小红书
小红书号:3189205503 qq

Let $F_- : |\Delta^p| \to X_{a_0}$ be the map obtained by restricting F_0 to $|\Delta^p| \times |\Delta^q| \times \{0\}$. For every point $x \in X_{a_0}$, choose an open neighborhood $U_x \subseteq X$ as in Definition A.5.5. Choose a triangulation of the simplex $|\Delta^p|$ with the following property: for every simplex τ of the triangulation, the image $F_-(\tau)$ is contained in some U_x. Refining our triangulation if necessary, we may assume that $|\partial \Delta^p|$ is a subcomplex of $|\Delta^p|$. For every subcomplex L of $|\Delta^p|$ which contains $|\partial \Delta^p|$, we let $K_L \subseteq |\Delta^p| \times |\Delta^q|$ denote the union of the closed subsets $L \times |\Delta^q|$ and $|\Delta^p| \times |\Lambda^q_j|$ and $K'_L \subseteq |\Delta^p| \times |\Delta^q| \times [0,1]$ denote the union of the closed subsets $K_L \times [0,1]$ and $|\Delta^p| \times |\Delta^q| \times \{0,1\}$. We will show that F_0 can be extended to a continuous map $F_L : K'_L \to X$ (satisfying the condition that $F_L(s) \in X_{a_n}$ for $s \notin K'$), using induction on the number of simplices of L. If $L = |\partial \Delta^p|$, there is nothing to prove. Otherwise, we may assume without loss of generality that $L = L_0 \cup \tau$, where L_0 is another subcomplex of $|\Delta^p|$ containing $|\partial \Delta^p|$ and τ is a simplex of L such that $\tau \cap L_0 = \partial \tau$. The inductive hypothesis guarantees the existence of a map $F_{L_0} : K'_{L_0} \to X$ with the desired properties.

Let $K_\tau \subseteq \tau \times |\Delta^q|$ be the union of the closed subsets $\partial \tau \times |\Delta^q|$ and $\tau \times |\Lambda^q_j|$, and let $K'_\tau \subseteq \tau \times |\Delta^q| \times [0,1]$ be the union of the closed subsets $K_\tau \times [0,1]$ and $\tau \times |\Delta^q| \times \{0,1\}$. The map F_{L_0} restricts to a map $G_0 : K'_\tau \to X$. To construct F_L, it will suffice to extend G_0 to a continuous map $G : \tau \times |\Delta^q| \times [0,1] \to X$ (satisfying the condition that $G(s) \in X_{a_n}$ for $s \notin K'_\tau$).

By assumption, the map G_0 carries $\tau \times |\Delta^q| \times \{0\}$ into an open subset U_x, for some $x \in X_{a_0}$. Let $U = U_x$, and choose a homeomorphism $U \simeq Z \times C(Y)$, where Y is an $A_{>a_0}$-stratified space. Since $\tau \times |\Delta^q|$ is compact, we deduce that $G_0(\tau \times |\Delta^q| \times [0,r]) \subseteq U$ for some real number $0 < r < 1$. Let $X' = X - X_{a_0}$ and let $A' = A - \{a_0\}$, so that X' is an A'-stratified space. Let m be the dimension of the simplex τ. The restriction $G_0 | (\tau \times |\Delta^q| \times \{1\})$ determines a map of simplicial sets $\overline{h}_1 : \Delta^m \times \Delta^q \to \mathrm{Sing}^{A'}(X')$. Let J denote the simplicial set $(\partial \Delta^m \times \Delta^q) \coprod_{\partial \Delta^m \times \Lambda^q_j} (\Delta^m \times \Lambda^q_j)$. The restriction of G_0 to $K_\tau \times [r,1]$ determines another map of simplicial sets $h : J \times \Delta^1 \to \mathrm{Sing}^{A'}(X')$, which is a natural transformation from $h_0 = h|(J \times \{0\})$ to $h_1 = h|(J \times \{1\}) = \overline{h}_1 | J$. It follows from the inductive hypothesis that $\mathrm{Sing}^{A'}(X')$ is an ∞-category, and (using (3)) that natural transformation h is an equivalence. Consequently, we can lift h to an equivalence $\overline{h} : \overline{h}_0 \to \overline{h}_1$ in $\mathrm{Fun}(J, \mathrm{Sing}^{A'}(X'))$. This morphism determines a continuous map $G_+ : \tau \times |\Delta^q| \times [r,1] \to X$ which agrees with G_0 on $(\tau \times |\Delta^q| \times [r,1]) \cap K'_\tau$.

Let us identify $|\Delta^q|$ with the set of tuples of real numbers $\vec{t} = (t_0, t_1, \ldots, t_q)$ such that $0 \leq t_k \leq 1$ and $t_0 + \cdots + t_q = 1$. In this case, we let $d(\vec{t}) = \inf\{t_k : k \neq j\}$: note that $d(\vec{t}) = 0$ if and only if $\vec{t} \in |\Lambda^q_j|$. If u is a real number satisfying $0 \leq u \leq d(\vec{t})$, we let $\vec{t}_u$ denote the tuple

$$(t_0 - u, t_1 - u, \ldots, t_{j-1} - u, t_j + qu, t_{j+1-u} - u, \ldots, t_q - u) \in |\Delta^q|.$$

Choose a continuous function $d' : \tau \to [0,1]$ which vanishes on $\partial \tau$ and is positive on the interior of $\mathbf{R}$. For every positive real number v, let $c_v : \tau \times |\Delta^q| \times [r,1] \to \tau \times |\Delta^q| \times [r,1]$

小红书
小红书号:3189205503 qq

given by the formula

$$c_v(s, \vec{t}, r') = (s, \vec{t}_{d(\vec{t})} \frac{vd'(s)(1-r')}{1 + vd'(s)(1-r')}, r'),$$

and let G^v_+ denote the composition $G_+ \circ c_v$. Since G_+ agrees with G_0 on $K_\tau \times \{r\}$, it carries $K_\tau \times \{r\}$ into U. By continuity, there exists a neighborhood V of K_τ in $\tau \times |\Delta^q|$ such that $G_+(V \times \{r\}) \subseteq U$. If the real number v is sufficiently large, then $c_v(\tau \times |\Delta^q| \times \{r\}) \subseteq V$, so that $G^v_+(\tau \times |\Delta^q| \times \{r\}) \subseteq U$. Replacing G_+ by G^v_+, we may assume that $G_+(\tau \times |\Delta^q| \times \{r\}) \subseteq U$ (here we invoke the assumption that $j < q$ to guarantee that G_+ continues to satisfy the requirement that $G_+(s, \vec{t}, r') \in X_{a_n}$ whenever $\vec{t} \notin |\Lambda^q_j|$).

Let $X'' = U - X_{a_0} \simeq Z \times Y \times \mathbf{R}_{>0}$. The A'-stratification of X' restricts to a (conical) A'-stratification of X''. Let $g : \tau \times |\Delta^q| \times \{r\} \to X''$ be the map obtained by restricting G_+. Then g determines a map of simplicial sets $\overline{\phi}_0 : \Delta^m \times \Delta^q \to \mathrm{Sing}^{A'}(X'')$. Let I denote the simplicial set

$$\Delta^{\{0,1\}} \coprod_{\{1\}} \Delta^{\{1,2\}} \coprod_{\{2\}} \Delta^{\{2,3\}} \coprod_{\{3\}} \cdots,$$

and identify the geometric realization $|I|$ with the open interval $(0, r]$. Then G_0 determines a map of simplicial sets $J \times I \to \mathrm{Sing}^{A'}(X'')$, which we can identify with a sequence of maps $\phi_0, \phi_1, \ldots \in \mathrm{Fun}(J, \mathrm{Sing}^{A'}(X''))$ together with natural transformations $\phi_0 \to \phi_1 \to \ldots$. We note that $\phi_0 = \overline{\phi}_0 | J$. The inductive hypothesis guarantees that $\mathrm{Sing}^{A'}(X'')$ is an ∞-category, and assertion (3) ensures that each of the natural transformations $\phi_k \to \phi_{k+1}$ is an equivalence. It follows that we can lift these natural transformations to obtain a sequence of equivalences

$$\overline{\phi}_0 \to \overline{\phi}_1 \to \overline{\phi_2} \to \cdots$$

in the ∞-category $\mathrm{Fun}(\Delta^m \times \Delta^q, \mathrm{Sing}^{A'}(X''))$. This sequence of equivalences is given by a map of simplicial sets $\Delta^m \times \Delta^q \times I \to \mathrm{Sing}^{A'}(X'')$, which we can identify with a continuous map $\tau \times |\Delta^q| \times (0, r] \to Z \times Y \times \mathbf{R}_{>0}$. Let $y : \tau \times |\Delta^q| \times (0, r] \to Y$ be the projection of this map onto the second fiber.

We observe that G_+ and G_0 together determine a map $(K_\tau \times [0, r]) \coprod_{K_\tau \times \{0,r\}} (\tau \times |\Delta^q| \times \{0, r\}) \to X'$. Let z denote the composition of this map with the projection $U \to Z \times \mathbf{R}_{\geq 0}$. Since the domain of z is a retract of $\tau \times |\Delta^q| \times [0, r]$, we can extend z to a continuous map $\overline{z} : \tau \times |\Delta^q| \times [0, r] \to Z \times \mathbf{R}_{\geq 0}$. Let $\overline{z}_1 : \tau \times |\Delta^q| \times [0, r] \to \mathbf{R}_{\geq 0}$ be obtained from $\overline{z}$ by projection onto the second factor. By adding to $\overline{z}_1$ a function which vanishes on $(K_\tau \times [0, r]) \coprod_{K_\tau \times \{0,r\}} (\tau \times |\Delta^q| \times \{0, r\})$ and is positive elsewhere, we can assume that $\overline{z}_1^{-1}\{0\} = \tau \times |\Delta^q| \times \{0\}$. Let $G_- : \tau \times |\Delta^q| \times [0, r] \to U \simeq Z \times C(Y)$ be the map which is given by $\overline{z}$ on $\tau \times |\Delta^q| \times \{0\}$ and by the pair $(\overline{z}, y)$ on $\tau \times |\Delta^q| \times (0, r]$. Then G_- and G_+ together determine an extension $G : \tau \times |\Delta^q| \times [0, 1] \to X$ of G_0 with the desired properties.

小红书
小红书号:3189205503 qq

(b) Suppose now that $0 < i \leq p$. The proof proceeds as in case (a) with some minor changes. We let $q = n - p - 1$ as before, so that we have an identification of $|\Delta^n|$ with the pushout

$$|\Delta^p| \coprod_{|\Delta^p| \times |\Delta^q| \times \{0\}} (|\Delta^p| \times |\Delta^q| \times [0,1]) \coprod_{|\Delta^p| \times |\Delta^q| \times \{1\}} |\Delta^q|.$$

Let $K \subseteq |\Delta^p| \times |\Delta^q|$ be the union of the closed subsets $|\Lambda^p_i| \times |\Delta^q|$ and $|\Delta^p| \times |\partial \Delta^q|$, so that $|\Lambda^n_i|$ can be identified with the pushout

$$|\Delta^p| \coprod_{|\Delta^p| \times |\Delta^q| \times \{0\}} (K \times [0,1]) \coprod_{|\Delta^p| \times |\Delta^q| \times \{1\}} |\Delta^q|.$$

Let $K' \subseteq |\Delta^p| \times |\Delta^q| \times [0,1]$ be the union of $K \times [0,1]$ with $|\Delta^p| \times |\Delta^q| \times \{0,1\}$. Then σ_0 determines a continuous map $F_0 : K' \to X$. To construct the map σ, we must extend F_0 to a map $F : |\Delta^p| \times |\Delta^q| \times [0,1] \to X$ satisfying the following condition: for every point $s \in (|\Delta^p| \times |\Delta^q| \times [0,1]) - K'$, we have $F(s) \in X_{a_n}$.

We observe that there is a homeomorphism of $|\Delta^p|$ with $|\Delta^{p-1}| \times [0,1]$ which carries $|\Lambda^p_i|$ to $|\Delta^{p-1}| \times \{0\}$. Let $F_- : |\Delta^{p-1}| \times [0,1] \to X_{a_0}$ be the map determined by σ_0 together with this homeomorphism. For every point $x \in X_{a_0}$, choose an open neighborhood $U_x \subseteq X$ as in Definition A.5.5. Choose a triangulation of the simplex $|\Delta^{p-1}|$ and a large positive integer N so that the following condition is satisfied: for every simplex τ of $|\Delta^{p-1}|$ and every nonnegative integer $k < N$, the map F_- carries $\tau \times [\frac{k}{N}, \frac{k+1}{N}]$ into some U_x. For every subcomplex L of $|\Delta^{p-1}|$, we let $K_L \subseteq |\Delta^p| \times |\Delta^q|$ denote the union of the closed subsets $L \times [0,1] \times |\Delta^q|$, $|\Delta^{p-1}| \times \{0\} \times |\Delta^q|$, and $|\Delta^{p-1}| \times [0,1] \times |\partial \Delta^q|$. Let $K'_L \subseteq |\Delta^p| \times |\Delta^q| \times [0,1]$ denote the union of the closed subsets $K_L \times [0,1]$ and $|\Delta^p| \times |\Delta^q| \times \{0,1\}$. We will show that F_0 can be extended to a continuous map $F_L : K'_L \to X$ (satisfying the condition that $F_L(s) \in X_{a_n}$ for $s \notin K'$), using induction on the number of simplices of L. If L is empty there is nothing to prove. Otherwise, we may assume without loss of generality that $L = L_0 \cup \tau$, where τ is a simplex of $|\Delta^{p-1}|$ such that $\tau \cap L_0 = \partial \tau$. The inductive hypothesis guarantees the existence of a map $F_{L_0} : K'_{L_0} \to X$ with the desired properties.

For $0 \leq k \leq N$, let $K_{\tau,k} \subseteq \tau \times [0,1] \times |\Delta^q|$ be the union of the closed subsets $\partial \tau \times [0,1] \times |\Delta^q|$, $\tau \times [0, \frac{k}{N}] \times |\Delta^q|$, and $\tau \times [0,1] \times |\partial \Delta^q|$. Let $K'_{\tau,k} \subseteq \tau \times [0,1] \times |\Delta^q| \times [0,1]$ be the union of the closed subsets $K_{\tau,k} \times [0,1]$ and $\tau \times |\Delta^q| \times \{0,1\}$. The map F_{L_0} restricts to a map $F[0] : K'_{\tau,0} \to X$. To construct F_L, it will suffice to extend G_0 to a continuous map $F[N] : K_{\tau,N} \times [0,1] \to X$ (satisfying the condition that $F[n](s) \in X_{a_n}$ for $s \notin K'_\tau$). We again proceed by induction, constructing maps $F[k] : K'_{\tau,k} \to X$ for $k \leq N$ using recursion on k. Assume that $k > 0$ and that $F[k-1]$ has already been constructed.

Let $\overline{\tau}$ denote the prism $\tau \times [\frac{k-1}{N}, \frac{k}{N}]$, and let $\overline{\tau}_0$ denote the closed subset of $\overline{\tau}$ which is the union of $\partial \tau \times [\frac{k-1}{N}, \frac{k}{N}]$ with $\tau \times \{\frac{k-1}{N}\}$. Let $K_{\overline{\tau}} \subseteq \overline{\tau} \times |\Delta^q|$ denote the union of the closed subsets $\overline{\tau} \times |\partial \Delta^q|$ and $\overline{\tau}_0 \times |\Delta^q|$. Let $K'_{\overline{\tau}} \subseteq \overline{\tau} \times |\Delta^q| \times [0,1]$ be the union of the closed subsets

小红书
小红书号:3189205503 qq

$K_{\overline{\tau}} \times [0,1]$ with $\overline{\tau} \times |\Delta^q| \times \{0,1\}$. Then $F[k-1]$ determines a map $G_0 : K'_{\overline{\tau}} \to X$. To find the desired extension $F[k]$ of $F[k-1]$, it will suffice to prove that G_0 admits a continuous extension $G : \overline{\tau} \times |\Delta^q| \times [0,1]$ (again satisfying the condition that $G(s) \in X_{a_n}$ whenever $s \notin K'_{\overline{\tau}}$).

By assumption, the map G_0 carries $\overline{\tau} \times |\Delta^q| \times \{0\}$ into an open subset U_x, for some $x \in X_{a_0}$. Let $U = U_x$, and choose a homeomorphism $U \simeq Z \times C(Y)$, where Y is an $A_{>a_0}$-stratified space. Since $\tau \times |\Delta^q|$ is compact, we deduce that $G_0(\overline{\tau} \times |\Delta^q| \times [0,r]) \subseteq U$ for some real number $0 < r < 1$. Let $X' = X - X_{a_0}$ and let $A' = A - \{a_0\}$, so that X' is an A'-stratified space. Let m be the dimension of the simplex τ. The restriction $G_0|(\overline{\tau} \times |\Delta^q| \times \{1\})$ determines a map of simplicial sets $\overline{h}_1 : \Delta^m \times \Delta^1 \times \Delta^q \to \mathrm{Sing}^{A'}(X')$. Let J denote the simplicial subset of $\Delta^m \times \Delta^1 \times \Delta^q$ spanned by $\Delta^m \times \{0\} \times \Delta^q$, $\Delta^m \times \Delta^1 \times \partial \Delta^q$, and $\partial \Delta^m \times \Delta^1 \times \Delta^q$. The restriction of G_0 to $K_\tau \times [r,1]$ determines another map of simplicial sets $h : J \times \Delta^1 \to \mathrm{Sing}^{A'}(X')$, which is a natural transformation from $h_0 = h|(J \times \{0\})$ to $h_1 = h|(J \times \{1\}) = \overline{h}_1|J$. It follows from the inductive hypothesis that $\mathrm{Sing}^{A'}(X')$ is an ∞-category, and (using (3)) that natural transformation h is an equivalence. Consequently, we can lift h to an equivalence $\overline{h} : \overline{h}_0 \to \overline{h}_1$ in $\mathrm{Fun}(J, \mathrm{Sing}^{A'}(X'))$. This morphism determines a continuous map $G_+ : \overline{\tau} \times |\Delta^q| \times [r,1] \to X$ which agrees with G_0 on $(\overline{\tau} \times |\Delta^q| \times [r,1]) \cap K'_\tau$.

Let $d : |\Delta^q| \to [0,1]$ be a continuous function which vanishes precisely on $|\partial \Delta^q|$, and choose $d' : \tau \to [0,1]$ similarly. For every nonnegative real number v, let c_v be the map from $\tau \times [\frac{k-1}{N}, \frac{k}{N}] \times |\Delta^q| \times [r,1] \to \tau \times |\Delta^q| \times [r,1]$ to itself which is given by the formula

$$c_v(x, \frac{k-1}{N} + t, y, r') = (x, \frac{k-1}{N} + \frac{t}{1 + v d'(x) d(y)(1-r')}, y, r')$$

and let G^v_+ denote the composition $G_+ \circ c_v$. Since G_+ agrees with G_0 on $K_{\overline{\tau}} \times \{r\}$, it carries $K_\tau \times \{r\}$ into U. By continuity, there exists a neighborhood V of $K_{\overline{\tau}}$ in $\overline{\tau} \times |\Delta^q|$ such that $G_+(V \times \{r\}) \subseteq U$. If the real number v is sufficiently large, then $c_v(\overline{\tau} \times |\Delta^q| \times \{r\}) \subseteq V$, so that $G^v_+(\overline{\tau} \times |\Delta^q| \times \{r\}) \subseteq U$. Replacing G_+ by G^v_+, we may assume that $G_+(\overline{\tau} \times |\Delta^q| \times \{r\}) \subseteq U$.

Let $X'' = U - X_{a_0} \simeq Z \times Y \times \mathbf{R}_{>0}$. The A'-stratification of X' restricts to a (conical) A'-stratification of X''. Let $g : \overline{\tau} \times |\Delta^q| \times \{r\} \to X''$ be the map obtained by restricting G_+. Then g determines a map of simplicial sets $\overline{\phi}_0 : \Delta^m \times \Delta^1 \times \Delta^q \to \mathrm{Sing}^{A'}(X'')$. Let I denote the simplicial set

$$\Delta^{\{0,1\}} \coprod_{\{1\}} \Delta^{\{1,2\}} \coprod_{\{2\}} \Delta^{\{2,3\}} \coprod_{\{3\}} \cdots,$$

and identify the geometric realization $|I|$ with the open interval $(0,r]$. Then G_0 determines a map of simplicial sets $J \times I \to \mathrm{Sing}^{A'}(X'')$, which we can identify with a sequence of maps $\phi_0, \phi_1, \ldots \in \mathrm{Fun}(J, \mathrm{Sing}^{A'}(X''))$ together with natural transformations $\phi_0 \to \phi_1 \to \ldots$. We note that $\phi_0 = \overline{\phi}_0|J$. The inductive hypothesis guarantees that $\mathrm{Sing}^{A'}(X'')$ is an ∞-category, and assertion (3) ensures that each of the natural transformations $\phi_k \to \phi_{k+1}$ is an

小红书
小红书号:3189205503 qq

equivalence. It follows that we can lift these natural transformations to obtain a sequence of equivalences

$$\overline{\phi}_0 \to \overline{\phi}_1 \to \overline{\phi_2} \to \cdots$$

in the ∞-category $\mathrm{Fun}(\Delta^m \times \Delta^1 \times \Delta^q, \mathrm{Sing}^{A'}(X''))$. This sequence of equivalences is given by a map of simplicial sets $\Delta^m \times \Delta^1 \times \Delta^q \times I \to \mathrm{Sing}^{A'}(X'')$, which we can identify with a continuous map $\overline{\tau} \times |\Delta^q| \times (0,r] \to Z \times Y \times \mathbf{R}_{>0}$. Let $y : \overline{\tau} \times |\Delta^q| \times (0,r] \to Y$ be the projection of this map onto the second fiber.

We observe that G_+ and G_0 together determine a map $(K_{\overline{\tau}} \times [0,r]) \coprod_{\overline{K_\tau} \times \{0,r\}} (\overline{\tau} \times |\Delta^q| \times \{0,r\}) \to X'$. Let z denote the composition of this map with the projection $U \to Z \times \mathbf{R}_{\geq 0}$. Since the domain of z is a retract of $\overline{\tau} \times |\Delta^q| \times [0,r]$, we can extend z to a continuous map $\overline{z} : \overline{\tau} \times |\Delta^q| \times [0,r] \to Z \times \mathbf{R}_{\geq 0}$. Let $\overline{z}_1 : \overline{\tau} \times |\Delta^q| \times [0,r] \to \mathbf{R}_{\geq 0}$ be obtained from $\overline{z}$ by projection onto the second factor. By adding to $\overline{z}_1$ a function which vanishes on $(K_{\overline{\tau}} \times [0,r]) \coprod_{K_{\overline{\tau}} \times \{0,r\}} (\overline{\tau} \times |\Delta^q| \times \{0,r\})$ and is positive elsewhere, we can assume that $\overline{z}_1^{-1}\{0\} = \overline{\tau} \times |\Delta^q| \times \{0\}$. Let $G_- : \overline{\tau} \times |\Delta^q| \times [0,r] \to U \simeq Z \times C(Y)$ be the map which is given by $\overline{z}$ on $\overline{\tau} \times |\Delta^q| \times \{0\}$ and by the pair $(\overline{z}, y)$ on $\overline{\tau} \times |\Delta^q| \times (0,r]$. Then G_- and G_+ together determine an extension $G : \overline{\tau} \times |\Delta^q| \times [0,1] \to X$ of G_0 with the desired properties.

□

We conclude this section by describing the ∞-category of exit paths for a particularly simple class of stratified spaces: namely, the collection of simplicial complexes. We begin by reviewing some definitions.

Definition A.6.6. An *abstract simplicial complex* consists of the following data:

(1) A set V (the set of *vertices* of the complex).

(2) A collection S of nonempty finite subsets of V satisfying the following condition:

($*$) If $\emptyset \neq \sigma \subseteq \sigma' \subseteq V$ and $\sigma' \in S$, then $\sigma \in S$.

We will say that (V,S) is *locally finite* if each element $\sigma \in S$ is contained in only finitely many other elements of S.

Let (V,S) be an abstract simplicial complex, and choose a linear ordering on V. We let $\Delta^{(V,S)}$ denote the simplicial subset of Δ^V spanned by those simplices σ of Δ^V such that the set of vertices of σ belongs to S. Let $|\Delta^{(V,S)}|$ denote the geometric realization of $\Delta^{(V,S)}$. This topological space is independent of the choice of linear ordering on S, up to canonical homeomorphism. As a set, $|\Delta^{V,S}|$ can be identified with the collection of maps $w : V \to [0,1]$ such that $\mathrm{Supp}(w) = \{v \in V : w(v) \neq 0\} \in S$ and $\sum_{v \in V} w(v) = 1$.

小红书
小红书号:3189205503 qq

Definition A.6.7. Let (V, S) be an abstract simplicial complex. We regard S as a partially ordered set with respect to inclusions. Then $|\Delta^{(V,S)}|$ is equipped with a natural S-stratification, given by the map

$$(t \in |\Delta^{(V,S)}|) \mapsto (\mathrm{Supp}(t) \in S).$$

Proposition A.6.8. Let (V, S) be a locally finite abstract simplicial complex. Then the S-stratification of $|\Delta^{(V,S)}|$ is conical.

Proof. Consider an arbitrary $\sigma \in S$. Let $V' = V - \sigma$, and let $S' = \{\sigma' - \sigma : \sigma \subset \sigma' \in S\}$. Then (V', S') is another abstract simplicial complex. Let $Z = |\Delta^{(V,S)}|_\sigma$ and let $Y = |\Delta^{(V',S')}|$. Then the inclusion $Z \hookrightarrow |\Delta^{(V,S)}|$ extends to an open embedding $h : Z \times C(Y) \to |\Delta^{(V,S)}|$, which is given on $Z \times Y \times (0, \infty)$ by the formula

$$h(w_Z, w_Y, t)(v) = \begin{cases} \frac{w_Z(v)}{t+1} & \text{if } v \in \sigma \\ \frac{t w_Y(v)}{t+1} & \text{if } v \notin \sigma \end{cases}$$

If (V, S) is locally finite, then h is an open embedding whose image is $|\Delta^{(V,S)}|_{>\sigma}$, which proves that the S-stratification of $|\Delta^{(V,S)}|$ is conical. □

Corollary A.6.9. Let (V, S) be an abstract simplicial complex. Then the simplicial set $\mathrm{Sing}^S |\Delta^{(V,S)}|$ is an ∞-category.

Proof. For every subset $V_0 \subseteq V$, let $S_0 = \{\sigma \in S : \sigma \subseteq V_0\}$. Then $\mathrm{Sing}^S |\Delta^{(V,S)}|$ is equivalent to the filtered colimit $\varinjlim_{V_0} \mathrm{Sing}^{S_0} |\Delta^{(V_0,S_0)}|$, where the colimit is taken over all finite subsets $V_0 \subseteq V$. It will therefore suffice to prove that each $\mathrm{Sing}^{S_0} |\Delta^{(V_0,S_0)}|$ is an ∞-category. Replacing V by V_0, we may assume that V is finite so that (V, S) is locally finite. In this case, the desired result follows immediately from Proposition A.6.8 and Theorem A.6.4. □

Theorem A.6.10. Let (V, S) be an abstract simplicial complex. Then the projection $q : \mathrm{Sing}^S |\Delta^{(V,S)}| \to \mathrm{N}(S)$ is an equivalence of ∞-categories.

Proof. Since each stratum of $|\Delta^{(V,S)}|$ is nonempty, the map q is essentially surjective. To prove that q is fully faithful, fix points $x \in |\Delta^{(V,S)}|_\sigma$ and $y \in |\Delta^{(V,S)}|_{\sigma'}$. It is clear that $M = \mathrm{Map}_{\mathrm{Sing}^S |\Delta^{(V,S)}|}(x, y)$ is empty unless $\sigma \subseteq \sigma'$. We wish to prove that M is contractible if $\sigma \subseteq \sigma'$. We can identify M with $\mathrm{Sing}\, P$, where P is the space of paths $p : [0, 1] \to |\Delta^{(V,S)}|$ such that $p(0) = x$, $p(1) = y$, and $p(t) \in |\Delta(V, S)|_{\sigma'}$ for $t > 0$. It now suffices to observe that there is a contracting homotopy $h : P \times [0, 1] \to P$, given by the formula

$$h(p, s)(t) = (1 - s)p(t) + s(1 - t)x + sty.$$

□

小红书
小红书号:3189205503 qq

Remark A.6.11. Let (V, S) be an abstract simplicial complex. It is possible to construct an explicit homotopy inverse to the equivalence of ∞-categories $q : \mathrm{Sing}^S |\Delta^{(V,S)}| \to \mathrm{N}(S)$ of Theorem A.6.10. For each $\sigma \in S$ having cardinality n, we let $w_\sigma \in |\Delta^{(V,S)}|$ be the point described by the formula

$$w_\sigma(v) = \begin{cases} \frac{1}{n} & \text{if } v \in \sigma \\ 0 & \text{if } v \notin \sigma. \end{cases}$$

For every chain of subsets $\emptyset \neq \sigma_0 \subseteq \sigma_1 \subseteq \ldots \subseteq \sigma_k \in S$, we define a map $|\Delta^k| \to |\Delta^{(V,S)}|$ by the formula

$$(t_0, \ldots, t_k) \mapsto t_0 w_{\sigma_0} + \cdots + t_k w_{\sigma_k}.$$

This construction determines section $\phi : \mathrm{N}(S) \to \mathrm{Sing}^S |\Delta^{(V,S)}|$ of q, and is therefore an equivalence of ∞-categories. The induced map of topological spaces $|\mathrm{N}(S)| \to |\Delta^{(V,S)}|$ is a homeomorphism: it is given by the classical process of *barycentric subdivision* of the simplicial complex $|\Delta^{(V,S)}|$.

A.7 A Seifert-van Kampen Theorem for Exit Paths

Our goal in this section is to prove the following generalization of Theorem A.3.1:

Theorem A.7.1. Let A be a partially ordered set, let X be an A-stratified topological space, and let $\mathcal{C}$ be a category equipped with a functor $U : \mathcal{C} \to \mathcal{U}(X)$, where $\mathcal{U}(X)$ denotes the partially ordered set of all open subsets of X. Assume that the following conditions are satisfied:

(i) The A-stratification of X is conical.

(ii) For every point $x \in X$, the full subcategory $\mathcal{C}_x \subseteq \mathcal{C}$ spanned by those objects $C \in \mathcal{C}$ such that $x \in U(C)$ has weakly contractible nerve.

Then U exhibits the ∞-category $\mathrm{Sing}^A(X)$ as the colimit (in the ∞-category $\mathcal{C}\mathrm{at}_\infty$) of the diagram

$$\{\mathrm{Sing}^A(U(C))\}_{C \in \mathcal{C}}.$$

Remark A.7.2. Theorem A.7.1 reduces to Theorem A.3.1 in the special case where A has only a single element.

The proof of Theorem A.7.1 will occupy our attention throughout this section. We begin by establishing some notation.

Definition A.7.3. Let A be a partially ordered set and X an A-stratified topological space. Given a chain of elements $a_0 \leq \ldots \leq a_n$ in A (which we can identify with an n-simplex $\vec{a}$ in $\mathrm{N}(A)$), we let $\mathrm{Sing}^A(X)[\vec{a}]$ denote the fiber product $\mathrm{Fun}(\Delta^n, \mathrm{Sing}^A(X)) \times_{\mathrm{Fun}(\Delta^n, \mathrm{N}(A))} \{\vec{a}\}$.

小红书
小红书号:3189205503 qq

Remark A.7.4. Suppose that X is a conically A-stratified topological space. It follows immediately from Theorem A.6.4 that for every n-simplex $\vec{a}$ of $\mathrm{N}(A)$, the simplicial set $\mathrm{Sing}^A(X)[\vec{a}]$ is a Kan complex.

Example A.7.5. Let $a \in A$ be a 0-simplex of $\mathrm{N}(A)$, and let X be an A-stratified topological space. Then $\mathrm{Sing}^A(X)[a]$ can be identified with the Kan complex $\mathrm{Sing}(X_a)$.

In the special case where $\vec{a} = (a_0 \leq a_1)$ is an edge of $\mathrm{N}(A)$, the simplicial set $\mathrm{Sing}^A(X)[\vec{a}]$ can be viewed as the space of paths $p : [0,1] \to X$ such that $p(0) \in X_{a_0}$ and $p(t) \in X_{a_1}$ for $t \neq 0$. The essential information is encoded in the behavior of the path $p(t)$ where t is close to zero. To make this more precise, we need to introduce a bit of notation.

Definition A.7.6. Let A be a partially ordered set, let X be an A-stratified topological space, and let $a \leq b$ be elements of A. We define a simplicial set $\mathrm{Sing}^A_{a \leq b}(X)$ as follows:

(∗) An n-simplex of $\mathrm{Sing}^A_{a \leq b}(X)$ consists of an equivalence class of pairs (ϵ, σ), where ϵ is a positive real number and $\sigma : |\Delta^n| \times [0, \epsilon] \to X$ is a continuous map such that $\sigma(|\Delta^n| \times \{0\}) \subseteq X_a$ and $\sigma(|\Delta^n| \times (0, \epsilon]) \subseteq X_b$. Here we regard (ϵ, σ) and (ϵ', σ') as equivalent if there exists a positive real number $\epsilon'' < \epsilon, \epsilon'$ such that $\sigma|(|\Delta^n| \times [0, \epsilon'']) = \sigma'|(|\Delta^n| \times [0, \epsilon''])$.

More informally, we can think of $\mathrm{Sing}^A_{a \leq b}(X)$ as the space of germs of paths in X which begin in X_a and then pass immediately into X_b. There is an evident map $\mathrm{Sing}^A(X)[a \leq b] \to \mathrm{Sing}^A_{a \leq b}(X)$, which is given by passing from paths to germs of paths.

Lemma A.7.7. Let A be a partially ordered set, X an A-stratified topological space, and $a \leq b$ elements of A. Then the map $\phi : \mathrm{Sing}^A(X)[a \leq b] \to \mathrm{Sing}^A_{a \leq b}(X)$ is a weak homotopy equivalence of simplicial sets.

Proof. For every positive real number ϵ, let $S[\epsilon]$ denote the simplicial set whose n-simplces are maps $\sigma : |\Delta^n| \times [0, \epsilon] \to X$ such that $\sigma(|\Delta^n| \times \{0\}) \subseteq X_a$ and $\sigma(|\Delta^n| \times (0, \epsilon]) \subseteq X_b$. There are evident restriction maps

$$\mathrm{Sing}^A(X)[a \leq b] = S[1] \to S[\frac{1}{2}] \to S[\frac{1}{4}] \to \cdots$$

and the colimit of this sequence can be identified with $\mathrm{Sing}^A_{a \leq b}(X)$. Consequently, to prove that ϕ is a weak homotopy equivalence, it will suffice to show that each of the restriction maps $\psi : S[\epsilon] \to S[\frac{\epsilon}{2}]$ is a weak homotopy equivalence. It now suffices to observe that ψ is a pullback of the trivial Kan fibration $\mathrm{Fun}(\Delta^1, \mathrm{Sing}(X_b)) \to \mathrm{Fun}(\{0\}, \mathrm{Sing}(X_b))$. □

The space of germs $\mathrm{Sing}^A_{a \leq b}(X)$ enjoys a formal advantage over the space of paths of fixed length:

Lemma A.7.8. Let A be a partially ordered set, X a conically A-stratified topological space, and $a \leq b$ elements of A. Then the restriction map $\mathrm{Sing}^A_{a \leq b}(X) \to \mathrm{Sing}(X_a)$ is a Kan fibration.

小红书
小红书号:3189205503 qq

Proof. We must show that every lifting problem of the form

$$\begin{array}{ccc} \Lambda^{n+1}_i & \xrightarrow{F^0_+} & \mathrm{Sing}^A_{a\leq b}(X) \\ \downarrow & \nearrow_{F^0_-} & \downarrow \\ \Delta^{n+1} & \longrightarrow & \mathrm{Sing}(X_a) \end{array}$$

admits a solution. Let us identify $|\Delta^{n+1}|$ with a product $|\Delta^n| \times [0,1]$ in such a way that the closed subset $|\Lambda^{n+1}_i|$ is identified with $|\Delta^n| \times \{0\}$. We can identify F^0_+ with a continuous map $|\Delta^n| \times \{0\} \times [0,\epsilon] \to X$ for some positive real number ϵ, and F^0_- with a continuous map $|\Delta^n| \times [0,1] \times \{0\} \to X_a$. To solve the lifting problem, we must construct a positive real number $\epsilon' \leq \epsilon$ and a map $F : |\Delta^n| \times [0,1] \times [0,\epsilon'] \to X$ compatible with F^0_- and F^0_+ with the following additional property:

($*$) For $0 < t$, we have $F(v,s,t) \in X_b$.

For each point $x \in X_a$, choose a neighborhood U_x of x as in Definition A.5.5. Choose a triangulation of $|\Delta^n|$ and a nonnegative integer $N \gg 0$ with the property that for each simplex τ of $|\Delta^n|$ and $0 \leq k < N$, the map F^0_- carries $\tau \times [\frac{k}{N}, \frac{k+1}{N}]$ into some U_x for some point $x \in X_a$. For each subcomplex L of $|\Delta^n|$, we will prove that there exists a map $F_L : L \times [0,1] \times [0,\epsilon] \to X$ (possibly after shrinking ϵ) compatible with F^0_- and F^0_+ and satisfying condition $*$. Taking $L = |\Delta^n|$ we will obtain a proof of the desired result.

The proof now proceeds by induction on the number of simplices of L. If $L = \emptyset$ there is nothing to prove. Otherwise, we can write $L = L_0 \cup \tau$, where τ is a simplex of $|\Delta^n|$ such that $L_0 \cap \tau = \partial\tau$. By the inductive hypothesis, we may assume that the map F_{L_0} has already been supplied; let $F_{\partial\tau}$ be its restriction to $\partial\tau \times [0,1] \times [0,\epsilon]$. To complete the proof, it will suffice to show that we can extend $F_{\partial\tau}$ to a map $F_\tau : \tau \times [0,1] \times [0,\epsilon] \to X$ compatible with F^0_- and F^0_+ and satisfying ($*$) (possibly after shrinking the real number ϵ). We again proceed in stages by defining a compatible sequence of maps $F^k_\tau : \tau \times [0, \frac{k}{N}] \times [0,\epsilon] \to X$ using induction on $k \leq N$. The map F^0_τ is determined by F^0_+. Assume that F^{k-1}_τ has already been constructed. Let $K = \tau \times [\frac{k-1}{N}, \frac{k}{N}]$ and let K_0 be the closed subset of K given by the union of $\partial\tau \times [\frac{k-1}{N}, \frac{k}{N}]$ and $\tau \times \{\frac{k-1}{N}\}$. Then F^{k-1}_τ determines a continuous map

$$g_0 : (K \times \{0\}) \coprod_{K_0 \times \{0\}} (K_0 \times [0,\epsilon]) \to X.$$

To construct F^k_τ, it will suffice to extend g_0 to a continuous map $g : K \times [0,\epsilon] \to X$ satisfying ($*$) (possibly after shrinking ϵ).

By assumption, the map g_0 carries $K \times \{0\}$ into some open set $U = U_x$ of the form $Z \times C(Y)$ described in Definition A.5.5. Shrinking ϵ if necessary, we may assume that g_0 also carries $K_0 \times [0,\epsilon]$ into U. Let $g'_0 : (K \times \{0\}) \coprod_{K_0 \times \{0\}} (K_0 \times [0,\epsilon]) \to C(Y)$ be the composition of g_0 with the projection to $C(Y)$, and let $g''_0 : (K \times \{0\}) \coprod_{K_0 \times \{0\}} (K_0 \times [0,\epsilon]) \to Z$ be defined similarly. Let r be a retraction

小红书
小红书号:3189205503 qq

of K onto K_0, and let g' be the composition $K \times [0,\epsilon] \to K_0 \times [0,\epsilon] \xrightarrow{g'_0} C(Y)$; we observe that g' is an extension of g'_0 (since g'_0 is constant on $K \times \{0\}$). Let r' be a retraction of $K \times [0,\epsilon]$ onto $(K \times \{0\}) \coprod_{K_0 \times \{0\}} (K_0 \times [0,\epsilon])$, and let g'' be the composition $g''_0 \circ r'$. The pair (g', g'') determines a map $g : K \times [0,\epsilon] \to X$ with the desired properties. □

Proposition A.7.9. Let A be a partially ordered set, let X be a conically A-stratified space, let U be an open subset of X (which inherits the structure of a conically A-stratified space), and let $\vec{a} = (a_0 \leq a_1 \leq \ldots \leq a_n)$ be an n-simplex of $\mathrm{N}(A)$. Then the diagram of Kan complexes

$$\begin{array}{ccc} \mathrm{Sing}^A(U)[\vec{a}] & \longrightarrow & \mathrm{Sing}^A(X)[\vec{a}] \\ \downarrow & & \downarrow \\ \mathrm{Sing}(U_{a_0}) & \longrightarrow & \mathrm{Sing}(X_{a_0}) \end{array}$$

is a homotopy pullback square.

Proof. The proof proceeds by induction on n. If $n = 0$ the result is obvious. If $n > 1$, then let $\vec{a}'$ denote the truncated chain $(a_0 \leq a_1)$ and $\vec{a}''$ the chain $(a_1 \leq \ldots \leq a_{n-1} \leq a_n)$. We have a commutative diagram

$$\begin{array}{ccc} \mathrm{Sing}^A(U)[\vec{a}] & \longrightarrow & \mathrm{Sing}^A(X)[\vec{a}] \\ \downarrow & & \downarrow \\ \mathrm{Sing}^A(U)[\vec{a}'] \times_{\mathrm{Sing}(U_{a_1})} \mathrm{Sing}^A(U)[\vec{a}''] & \longrightarrow & \mathrm{Sing}^A(X)[\vec{a}'] \times_{\mathrm{Sing}(X_{a_1})} \mathrm{Sing}^A(X)[\vec{a}''] \\ \downarrow & & \downarrow \\ \mathrm{Sing}^A(U)[\vec{a}'] & \longrightarrow & \mathrm{Sing}^A(X)[\vec{a}'] \\ \downarrow & & \downarrow \\ \mathrm{Sing}(U_{a_0}) & \longrightarrow & \mathrm{Sing}(X_{a_0}). \end{array}$$

The upper square is a homotopy pullback because the vertical maps are weak homotopy equivalences (since $\mathrm{Sing}^A(U)$ and $\mathrm{Sing}^A(X)$ are ∞-categories, by virtue of Theorem A.6.4). The lower square is a homotopy pullback by the inductive hypothesis. The middle square is a (homotopy) pullback of the diagram

$$\begin{array}{ccc} \mathrm{Sing}^A(U)[\vec{a}''] & \longrightarrow & \mathrm{Sing}^A(X)[\vec{a}''] \\ \downarrow & & \downarrow \\ \mathrm{Sing}(U_{a_1}) & \longrightarrow & \mathrm{Sing}(X_{a_1}), \end{array}$$

and therefore also a homotopy pullback square by the inductive hypothesis. It follows that the outer rectangle is a homotopy pullback as required.

小红书
小红书号:3189205503 qq

It remains to treat the case $n = 1$. We have a commutative diagram

$$\begin{array}{ccc} \mathrm{Sing}^A(U)[a_0 \leq a_1] & \longrightarrow & \mathrm{Sing}^A(X)[a_0 \leq a_1] \\ \downarrow & & \downarrow \\ \mathrm{Sing}^A_{a_0 \leq a_1}(U) & \longrightarrow & \mathrm{Sing}^A_{a_0 \leq a_1}(X) \\ \downarrow & & \downarrow \\ \mathrm{Sing}(U_{a_0}) & \longrightarrow & \mathrm{Sing}(X_{a_0}). \end{array}$$

The lower square is a homotopy pullback since it is a pullback square in which the vertical maps are Kan fibrations (Lemma A.7.8). The upper square is a homotopy pullback since the upper vertical maps are weak homotopy equivalences (Lemma A.7.7). It follows that the outer square is also a homotopy pullback, as desired. □

Proposition A.7.10. Let $G : \mathcal{C}\mathrm{at}_\infty \to \mathrm{Fun}(\mathrm{N}(\mathbf{\Delta})^{op}, \mathcal{S})$ be the functor given by the formula

$$G(\mathcal{C})([n]) = \mathrm{Map}_{\mathcal{C}\mathrm{at}_\infty}(\Delta^n, \mathcal{C}).$$

Then G is a fully faithful embedding.

Remark A.7.11. In fact, one can be more precise: the essential image of the functor $G : \mathcal{C}\mathrm{at}_\infty \to \mathrm{Fun}(\mathrm{N}(\mathbf{\Delta})^{op}, \mathcal{S})$ can be identified with the full subcategory of $\mathrm{Fun}(\mathrm{N}(\mathbf{\Delta})^{op}, \mathcal{S})$ spanned by the *complete Segal spaces*. We refer the reader to [83] for a proof of this statement (in the language of model categories).

Proof of Proposition A.7.10. Let $f : \mathrm{N}(\mathbf{\Delta}) \to \mathcal{C}\mathrm{at}_\infty$ be the functor given by $[n] \mapsto \Delta^n$, so that f extends (in an essentially unique way) to a colimit-preserving functor $F : \mathcal{P}(\mathrm{N}(\mathbf{\Delta})) \to \mathcal{C}\mathrm{at}_\infty$ which is left adjoint to G. We will show that the counit map $F \circ G \to \mathrm{id}$ is an equivalence from $\mathcal{C}\mathrm{at}_\infty$ to itself.

We now reformulate the desired conclusion in the language of model categories. We can identify $\mathcal{C}\mathrm{at}_\infty$ with the underlying ∞-category $\mathbf{A}^\circ$ of the simplicial model category $\mathbf{A} = \mathcal{S}\mathrm{et}^+_\Delta$ of marked simplicial sets, with the Cartesian model structure described in §HTT.3.1 . The diagram f is then obtained from a diagram $\overline{f} : \mathbf{\Delta} \to \mathbf{A}$, given by the cosimplicial object $[n] \mapsto (\Delta^n)^\flat$, which we can extend to a colimit-preserving functor

$$\overline{F} : \mathrm{Fun}(\mathbf{\Delta}^{op}, \mathcal{S}\mathrm{et}_\Delta) \to \mathbf{A}.$$

Here $\mathrm{Fun}(\mathbf{\Delta}^{op}, \mathcal{S}\mathrm{et}_\Delta)$ can be identified with the category of bisimplicial sets. Since the cosimplicial object $\overline{f} \in \mathrm{Fun}(\mathbf{\Delta}, \mathbf{A})$ is Reedy cofibrant (see §HTT.A.2.9), the functor $\overline{F}$ is a left Quillen functor if we endow $\mathrm{Fun}(\mathbf{\Delta}^{op}, \mathcal{S}\mathrm{et}_\Delta)$ with the injective model structure (Example HTT.A.2.9.28). The functor $\overline{F}$ has a right adjoint $\overline{G}$, given by the formula

$$\overline{G}(X)^{m,n} = \mathrm{Hom}_{\mathbf{A}}((\Delta^m)^\flat \times (\Delta^n)^\sharp, X).$$

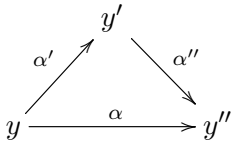
小红书
小红书号:3189205503 qq

This right adjoint induces a functor from $\mathbf{A}^{\circ}$ to $\mathrm{Fun}(\mathbf{\Delta}^{op}, \mathcal{S}\mathrm{et}_{\Delta})^{\circ}$, which (after passing to the simplicial nerve) is equivalent to the functor $G : \mathcal{C}\mathrm{at}_{\infty} \to \mathcal{P}(\mathrm{N}(\mathbf{\Delta}))$ considered above. Consequently, it will suffice to show that the counit map $L\overline{F} \circ R\overline{G} \to \mathrm{id}_{\mathrm{h}\mathbf{A}}$ is an equivalence of functors, where $L\overline{F}$ and $R\overline{G}$ denote the left and right derived functors of $\overline{F}$ and $\overline{G}$, respectively. Since every object of $\mathrm{Fun}(\mathbf{\Delta}^{op}, \mathcal{S}\mathrm{et}_{\Delta})$ is cofibrant, we can identify $\overline{F}$ with its left derived functor. We are therefore reduced to proving the following:

(∗) Let $\overline{X} = (X, M)$ be a fibrant object of the category $\mathbf{A}$ of marked simplicial sets. Then the counit map $\eta_{\overline{X}} : \overline{FGX} \to \overline{X}$ is a weak equivalence in $\mathbf{A}$.

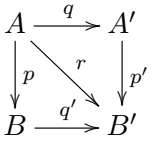
Since $\overline{X}$ is fibrant, the simplicial set X is an ∞-category and M is the collection of all equivalences in X. Unwinding the definitions, we can identify $\overline{FGX}$ with the marked simplicial set (Y, N) described as follows:

(*a*) An n-simplex of Y is a map of simplicial sets $\Delta^n \times \Delta^n \to X$, which carries every morphism of $\{i\} \times \Delta^n$ to an equivalence in $\mathcal{C}$, for $0 \leq i \leq n$.



(*b*) An edge $\Delta^1 \to Y$ belongs to N if and only if the corresponding map $\Delta^1 \times \Delta^1 \to X$ factors through the projection onto the second factor.

In terms of this identification, the map $\eta_{\overline{X}} : (Y, N) \to (X, M)$ is defined on n-simplices by composing with the diagonal map $\Delta^n \to \Delta^n \times \Delta^n$.



Let N' denote the collection of all edges of Y which correspond to maps from $(\Delta^1 \times \Delta^1)^{\sharp}$ into $\overline{X}$. The map $\eta_{\overline{X}}$ factors as a composition

$$(Y, N) \xrightarrow{i} (Y, N') \xrightarrow{\eta'_{\overline{X}}} (X, M).$$

We claim that the map i is a weak equivalence of marked simplicial sets. To prove this, it will suffice to show that for every edge α which belongs to N', there exists a 2-simplex σ :

in Y, where α' and α'' belong to N. To see this, let us suppose that α classifies a commutative diagram

in the ∞-category X. We wish to construct an appropriate 2-simplex σ in Y, corresponding to a map $\widetilde{\sigma} : \Delta^2 \times \Delta^2 \to X^{\simeq}$ (here $X^{\simeq}$ denotes the largest Kan complex contained in X). Let T denote

小红书
小红书号:3189205503 qq

the full subcategory of $\Delta^2 \times \Delta^2$ spanned by all vertices except for $(0,2)$, and let $\widetilde{\sigma}_0 : T \to X^0$ be the map described by the diagram

$$\begin{array}{ccccc} A & \xrightarrow{\mathrm{id}} & A & \xrightarrow{q} & A' \\ \downarrow{\scriptstyle q} & & \downarrow{\scriptstyle p} & & \downarrow{\scriptstyle \mathrm{id}} \\ A' & \xrightarrow{\mathrm{id}} & A' & \xrightarrow{\mathrm{id}} & A' \\ & & \downarrow{\scriptstyle p'} & & \downarrow{\scriptstyle p'} \\ & & B' & \xrightarrow{\mathrm{id}} & B'. \end{array}$$

To prove that $\widetilde{\sigma}_0$ can be extended to a map $\widetilde{\sigma}$ with the desired properties, it suffices to solve an extension problem of the form

$$\begin{array}{ccc} T \coprod_{\Delta^{\{0,2\}}} \Delta^2 & \longrightarrow & X^0 \\ \downarrow & \nearrow & \\ \Delta^2 \times \Delta^2. & & \end{array}$$

This is possible because X^0 is a Kan complex and the left vertical map is a weak homotopy equivalence. This completes the proof that i is a weak equivalence. By the two-out-of-three property, it will now suffice to show that $\eta'_{\overline{X}} : (Y, N') \to (X, M)$ is an equivalence of marked simplicial sets.

We now define maps $R_{\leq}, R_{\geq} : \Delta^1 \times Y \to Y$ as follows. Consider a map $g : \Delta^n \to \Delta^1 \times Y$, corresponding to a partition $[n] = [n]_- \cup [n]_+$ and a map $\widetilde{g} : \Delta^n \times \Delta^n \to X$. We then define $R_{\leq} \circ g$ to be the n-simplex of Y corresponding to the map $\widetilde{g} \circ \tau : \Delta^n \times \Delta^n \to X$, where $\tau : \Delta^n \times \Delta^n \to \Delta^n \times \Delta^n$ is defined on vertices by the formula

$$\tau(i,j) = \begin{cases} (i,j) & \text{if } i \leq j \\ (i,j) & \text{if } j \in [n]_- \\ (i,i) & \text{otherwise.} \end{cases}$$

Similarly, we let $R_{\geq} \circ g$ correspond to the map $\widetilde{g} \circ \tau'$, where τ' is given on vertices by the formula

$$\tau_{i,j} = \begin{cases} (i,j) & \text{if } i \geq j \\ (i,j) & \text{if } j \in [n]_+ \\ (i,I) & \text{otherwise.} \end{cases}$$

The map $R_{\leq}$ defines a homotopy from id_Y to an idempotent map $r_{\leq} : Y \to Y$. Similarly, $R_{\geq}$ defines a homotopy from an idempotent map $r_{\geq} : Y \to Y$ to the identity map id_Y. Let $Y_{\leq}, Y_{\geq} \subseteq Y$ denote the images of the maps $r_{\leq}$ and $r_{\geq}$, respectively. Let $N'_{\leq}$ denote the collection of all edges of Y which belong to N', and define $N'_{\geq}$ similarly. The map $R_{\leq}$ determines a map $(Y, N') \times (\Delta^1)^\sharp \to (Y, N')$, which exhibits $(Y_{\leq}, N'_{\leq})$ as a deformation retract of (Y, N') in the category of marked simplicial

小红书 小红书号:3189205503 qq

sets. Similarly, the map $R_{\geq}$ exhibits $(Y_{\leq} \cap Y_{\geq}, N'_{\leq} \cap N'_{\geq})$ as a deformation retract of $(Y_{\leq}, N'_{\leq})$. It will therefore suffice to show that the composite map

$$(Y_{\leq} \cap Y_{\geq}, N'_{\leq} \cap N'_{\geq}) \subseteq (Y, N') \to (X, M)$$

is a weak equivalence of marked simplicial sets. We now complete the proof by observing that this composite map is an isomorphism. □

We are now ready to establish our main result.

Proof of Theorem A.7.1. Let $G : \mathcal{C}\mathrm{at}_\infty \to \mathrm{Fun}(\mathrm{N}(\mathbf{\Delta})^{op}, \mathcal{S})$ be the functor described in Proposition A.7.10. Since G is fully faithful, it will suffice to prove that the composite functor

$$\theta : \mathrm{N}(\mathcal{C})^{\triangleright} \to \mathcal{C}\mathrm{at}_\infty \to \mathrm{Fun}(\mathrm{N}(\mathbf{\Delta})^{op}, \mathcal{S})$$

is a colimit diagram. Since colimits in $\mathrm{Fun}(\mathrm{N}(\mathbf{\Delta})^{op}, \mathcal{S})$ are computed pointwise, it will suffice to show that θ determines a colimit diagram in $\mathcal{S}$ after evaluation at each object $[n] \in \mathbf{\Delta}$. Unwinding the definitions, we see that this diagram is given by the formula

$$C \mapsto \coprod_{a_0 \leq a_1 \leq \cdots \leq a_n} \mathrm{Sing}^A(U(C))[a_0 \leq \ldots \leq a_n].$$

Since the collection of colimit diagrams is stable under coproducts (Lemma HTT.5.5.2.3), it will suffice to show that for every n-simplex $\vec{a} = (a_0 \leq \ldots \leq a_n)$ of $\mathrm{N}(A)$, the functor

$$\theta_{\vec{a}} : \mathrm{N}(\mathcal{C})^{\triangleright} \to \mathcal{S}$$

given by the formula $C \mapsto \mathrm{Sing}^A(U(C))[\vec{a}]$ is a colimit diagram in $\mathcal{S}$.

We have an evident natural tranformation $\alpha : \theta_{\vec{a}} \to \theta_{a_0}$. The functor θ_{a_0} is a colimit diagram in $\mathcal{S}$: this follows by applying Theorem A.3.1 to the stratum X_a. Proposition A.7.9 guarantees that α is a Cartesian natural transformation. Since $\mathcal{S}$ is an ∞-topos, Theorem HTT.6.1.0.6 guarantees that $\theta_{\vec{a}}$ is also a colimit diagram, as desired. □

A.8 Digression: Recollement

Let X be a topological space, let U be an open subset of X, and let $Y = X - U$. Let $i : Y \to X$ and $j : U \to X$ denote the inclusion maps. If $\mathcal{F}$ is a sheaf (of sets, say) on X, then $\mathcal{F}$ determines sheaves $\mathcal{F}_Y = i^* \mathcal{F}$ and $\mathcal{F}_U = j^* \mathcal{F}$ on Y and U, respectively. Moreover, there is a canonical map

$$u : \mathcal{F}_Y = i^* \mathcal{F} \to i^*(j_* j^* \mathcal{F}) = (i^* j_*) \mathcal{F}_U .$$

小红书
小红书号:3189205503 qq

We can recover $\mathcal{F}$ from the sheaves $\mathcal{F}_Y$ and $\mathcal{F}_U$, together with the map u: we have a pullback diagram of sheaves

$$\begin{array}{ccc} \mathcal{F} & \longrightarrow & i_* \mathcal{F}_Y \\ \downarrow & & \downarrow{\scriptstyle i_*(u)} \\ j_* \mathcal{F}_U & \longrightarrow & i_* i^* j_* \mathcal{F}_U . \end{array}$$

In fact, something even stronger is true: we can reconstruct the category of sheaves on X from the categories of sheaves on U and Y, respectively, together with the functor $i^* j_*$. In this section, we will give a general account of this reconstruction procedure, which is particularly effective in the setting of stable ∞-categories.

Our first step is to extract the essence of the above situation. If $i : Y \to X$ and $j : U \to X$ are closed and open embeddings of topological spaces, respectively, then the pushforward functors i_* and j_* are fully faithful. Moreover, these fully faithful functors admit left adjoints i^* and j^*, respectively, both of which are left exact.

Definition A.8.1. Let $\mathcal{C}$ be an ∞-category which admits finite limits, and let $\mathcal{C}_0, \mathcal{C}_1 \subseteq \mathcal{C}$ be full subcategories. We will say that $\mathcal{C}$ is a *recollement* of $\mathcal{C}_0$ and $\mathcal{C}_1$ if the following conditions are satisfied:

(a) The full subcategories $\mathcal{C}_0$ and $\mathcal{C}_1$ are stable under equivalence (that is, if $X \in \mathcal{C}$ is equivalent to an object $Y \in \mathcal{C}_i$, then $X \in \mathcal{C}_i$).

(b) The inclusion functors $\mathcal{C}_0 \hookrightarrow \mathcal{C}$ and $\mathcal{C}_1 \hookrightarrow \mathcal{C}$ admit left adjoints L_0 and L_1. In particular, $\mathcal{C}_0$ and $\mathcal{C}_1$ are closed under limits in $\mathcal{C}$, and therefore admit finite limits.

(c) The functors L_0 and L_1 are left exact.

(d) The functor L_1 carries every object of $\mathcal{C}_0$ to the final object of $\mathcal{C}$.

(e) If α is a morphism in $\mathcal{C}$ such that $L_0(\alpha)$ and $L_1(\alpha)$ are equivalences, then α is an equivalence.

In this case, we will also say that the localization functor L_0 is *complementary* to the localization functor L_1.

Warning A.8.2. The notion of recollement is not symmetric: if $\mathcal{C}$ is a recollement of $\mathcal{C}_0$ and $\mathcal{C}_1$, then it need not be a recollement of $\mathcal{C}_1$ and $\mathcal{C}_0$.

Remark A.8.3. There is an evident dual version of Definition A.8.1, which we will need in §A.9. If $\mathcal{C}$ is an ∞-category which admits finite colimits and we are given colocalization functors $L_0, L_1 : \mathcal{C} \to \mathcal{C}$, then we will say that L_0 is *complementary* to L_1 if the full subcategories $L_0 \mathcal{C}^{op}$ is complementary to $L_1 \mathcal{C}^{op}$ in $\mathcal{C}^{op}$, in the sense of Definition A.8.1.

小红书
小红书号:3189205503 qq

Example A.8.4. Let X be a topological space and suppose we are given a closed embedding $i : Y \to X$ and an open embedding $j : U \to X$. Let $\mathcal{S}\mathrm{hv}_{\mathcal{S}\mathrm{et}}(X)$ denote the nerve of the category of sheaves of sets on X, and define $\mathcal{S}\mathrm{hv}_{\mathcal{S}\mathrm{et}}(U)$ and $\mathcal{S}\mathrm{hv}_{\mathcal{S}\mathrm{et}}(Y)$ similarly. Let $\mathcal{C}_0 \subseteq \mathcal{S}\mathrm{hv}_{\mathcal{S}\mathrm{et}}(X)$ be the essential image of the pushforward functor i_*, and let $\mathcal{C}_1 \subseteq \mathcal{S}\mathrm{hv}_{\mathcal{S}\mathrm{et}}(X)$ be the essential image of the pushforward functor j_*. Then $\mathcal{C}_0, \mathcal{C}_1 \subseteq \mathcal{S}\mathrm{hv}_{\mathcal{S}\mathrm{et}}(X)$ automatically satisfy conditions (a), (b), and (c) of Definition A.8.1. Condition (d) is satisfied if $Y \cap U = \emptyset$, and the condition (e) is satisfied if $Y \cup U = X$. In particular, if $Y = X - U$, then $\mathcal{S}\mathrm{hv}_{\mathcal{S}\mathrm{et}}(X)$ is a recollement of $\mathcal{S}\mathrm{hv}_{\mathcal{S}\mathrm{et}}(Y)$ and $\mathcal{S}\mathrm{hv}_{\mathcal{S}\mathrm{et}}(U)$.

Remark A.8.5. Let $\mathcal{C}$ be an ∞-category which admits finite limits which is a recollement of full subcategories $\mathcal{C}_0, \mathcal{C}_1 \subseteq \mathcal{C}$, and let L_0 and L_1 denote left adjoints to the inclusions $\mathcal{C}_0 \hookrightarrow \mathcal{C}$, $\mathcal{C}_1 \hookrightarrow \mathcal{C}$. Then $\mathcal{C}_0$ is the full subcategory of $\mathcal{C}$ spanned by those objects C such that $L_1(C)$ is a final object of $\mathcal{C}$. It follows from axiom (d) of Definition A.8.1 that every object of $\mathcal{C}_0$ has this property. Conversely, suppose that $C \in \mathcal{C}$ is such that $L_1(C)$ is final. Let $u : C \to L_0(C)$ be the unit map. Then $L_0(u)$ is tautologically an equivalence, and $L_1(u)$ is an equivalence since it is a map between final objects of $\mathcal{C}$. It follows from (e) that u is an equivalence, so that $C \simeq L_0(C)$ belongs to $\mathcal{C}_0$.

Suppose now that the ∞-category $\mathcal{C}$ is pointed. Then, for every object $C \in \mathcal{C}$, the unit map $v : C \to L_1(C)$ becomes an equivalence after applying L_1, so that $L_1 \mathrm{fib}(v)$ is a final object of $\mathcal{C}$ and therefore $\mathrm{fib}(v) \in \mathcal{C}_0$. It follows that the inclusion functor $\mathcal{C}_0 \hookrightarrow \mathcal{C}$ admits a right adjoint, given by $C \mapsto \mathrm{fib}(C \to L_1(C))$.

We next illustrate Definition A.8.1 by constructing a large class of examples.

Definition A.8.6. Let $p : \mathcal{M} \to \Delta^1$ be a correspondence from an ∞-category $\mathcal{M}_0 = p^{-1}\{0\}$ to an ∞-category $\mathcal{M}_1 = p^{-1}\{1\}$. We will say that p is a *left exact correspondence* if the following conditions are satisfied:

- (i) The ∞-categories $\mathcal{M}_0$ and $\mathcal{M}_1$ admit finite limits.
- (ii) The map p is a Cartesian fibration.
- (iii) The functor $\mathcal{M}_1 \to \mathcal{M}_0$ determined by p is left exact.

Proposition A.8.7. Let $p : \mathcal{M} \to \Delta^1$ be a left exact correspondence, let $\mathcal{C} = \mathrm{Fun}_{\Delta^1}(\Delta^1, \mathcal{M})$ be the ∞-category of sections of p. Let $\mathcal{C}_0 \subseteq \mathcal{C}$ be the full subcategory of $\mathcal{C}$ spanned by those sections $s : \Delta^1 \to \mathcal{M}$ such that $s(1)$ is a final object of $\mathcal{M}_1$, and let $\mathcal{C}_1 \subseteq \mathcal{C}$ be the full subcategory of $\mathcal{C}$ spanned by the p-Cartesian morphisms in $\mathcal{M}$. Then $\mathcal{C}$ is a recollement of $\mathcal{C}_0$ and $\mathcal{C}_1$.

Proof. We will verify that $\mathcal{C}_0$ and $\mathcal{C}_1$ satisfy the conditions of Definition A.8.1. Condition (a) is obvious. It follows from Proposition HTT.4.3.2.15 that the evaluation functors

$$\mathcal{C}_0 \xrightarrow{e_0} \mathcal{M}_0 \qquad \mathcal{C}_1 \xrightarrow{e_1} \mathcal{M}_1$$

小红书
小红书号:3189205503 qq

are equivalences of ∞-categories. Let e_0^{-1} and e_1^{-1} denote homotopy inverses to e_0 and e_1, respectively. Then the composite functors

$$L_0 : \mathcal{C} \to \mathcal{M}_0 \xrightarrow{e_0^{-1}} \mathcal{C}_0 \qquad L_1 : \mathcal{C} \to \mathcal{M}_1 \xrightarrow{e_1^{-1}} \mathcal{C}_1$$

are left adjoints to the inclusion $\mathcal{C}_0 \hookrightarrow \mathcal{C} \hookleftarrow \mathcal{C}_1$, which are evidently left exact. This proves (b) and (c). Assertion (d) follows from the description of L_1 given above, together with the definition of $\mathcal{C}_0$. Assertion (e) follows from the observation that a morphism in $\mathcal{C}$ is an equivalence if and only if its images in $\mathcal{M}_0$ and $\mathcal{M}_1$ are equivalences. □

Proposition A.8.7 implies that every left exact correspondence determines an ∞-category $\mathcal{C}$ which is a recollement of full subcategories $\mathcal{C}_0, \mathcal{C}_1 \subseteq \mathcal{C}$. Our next goal is to show that that every instance of Definition A.8.1 arises in this way, for an essentially unique left exact correspondence. The uniqueness is a consequence of the following:

Proposition A.8.8. Let $p : \mathcal{M} \to \Delta^1$ and $q : \mathcal{N} \to \Delta^1$ be left exact correspondences. Define $\mathcal{C} \subseteq \mathrm{Fun}_{\Delta^1}(\Delta^1, \mathcal{M})$, $\mathcal{D} \subseteq \mathrm{Fun}_{\Delta^1}(\Delta^1, \mathcal{N})$ and full subcategories

$$\mathcal{C}_0, \mathcal{C}_1 \subseteq \mathcal{C} \qquad \mathcal{D}_0, \mathcal{D}_1 \subseteq \mathcal{D}$$

as in Proposition A.8.7, so that the ∞-categories $\mathcal{C}_0$ and $\mathcal{C}_1$ are the essential images of localization functors $L_0, L_1 : \mathcal{C} \to \mathcal{C}$ and the ∞-categories $\mathcal{D}_0$ and $\mathcal{D}_1$ are the essential images of localization functors L_0' and L_1'. Then the canonical map $\mathrm{Fun}_{\Delta^1}(\mathcal{M}, \mathcal{N}) \to \mathrm{Fun}(\mathcal{C}, \mathcal{D})$ is a fully faithful embedding, whose essential image is spanned by those functors $F : \mathcal{C} \to \mathcal{D}$ which carry L_0 equivalences to L_0' equivalences and L_1-equivalences to L_1'-equivalences.

Remark A.8.9. Proposition A.8.8 is valid under much weaker hypotheses than the ones we have given: it is not necessary that p and q be left exact correspondences, only that p is a Cartesian fibration and that $\mathcal{M}_1$ admits a final object.

Proof. Choose a right adjoint G to the evaluation functor $\mathcal{C} \to \mathcal{M}_1$. Then G determines a map $\Delta^1 \times \mathcal{M}_1 \to \mathcal{M}$, whose restriction to $\{0\} \times \mathcal{M}_1$ is a functor $\phi : \mathcal{M}_1 \to \mathcal{M}_0$ associated to the Cartesian fibration p. It follows from Let $\mathrm{Fun}'(\mathcal{C}, \mathcal{D})$ be the full subcategory of $\mathrm{Fun}(\mathcal{C}, \mathcal{D})$ spanned by those functors which carry L_1-equivalences in $\mathcal{C}$ to L_1'-equivalence in $\mathcal{D}$. We have a commutative diagram σ :

$$\begin{array}{ccc} \mathrm{Fun}_{\Delta^1}(\mathcal{M}, \mathcal{N}) & \longrightarrow & \mathrm{Fun}(\mathcal{M}_0, \mathcal{N}_0) \\ \downarrow & & \downarrow \\ \mathrm{Fun}'(\mathcal{C}, \mathcal{D}) & \longrightarrow & \mathrm{Fun}(\mathcal{C}, \mathcal{N}_0) \\ \downarrow & & \downarrow \\ \mathrm{Fun}(\mathcal{M}_1, \mathcal{D}) & \longrightarrow & \mathrm{Fun}(\mathcal{M}_1, \mathcal{N}_0). \end{array}$$

小红书
小红书号:3189205503 qq

Proposition HTT.3.2.2.7 that the induced map $\mathcal{M}_0 \coprod_{\{0\} \times \mathcal{M}_1} (\Delta^1 \times \mathcal{M}_1) \to \mathcal{D}$ is a categorical equivalence of simplicial sets, so that the outer rectangle in the diagram σ is a homotopy Cartesian. We claim that the lower square in σ is also homotopy Cartesian. To prove this, it suffices to show that the canonical map

$$\theta : \mathrm{Fun}'(\mathcal{C}, \mathcal{D}) \to \mathrm{Fun}(\mathcal{C}, \mathcal{N}_0) \times_{\mathrm{Fun}(\mathcal{C}_1, \mathcal{N}_0)} \mathrm{Fun}(\mathcal{C}_1, \mathcal{D})$$

is a trivial Kan fibration, where $\mathcal{C}_1 \subseteq \mathcal{C}$ denotes the essential image of G. Let $\mathcal{E}$ denote the full subcategory of $\mathcal{C} \times \Delta^1$ spanned by those pairs (C, i), where $C \in \mathcal{C}_1$ if $i = 1$. Proposition HTT.3.2.2.7 implies that the inclusion $\mathcal{C} \coprod_{\mathcal{C}_1 \times \{0\}} (\mathcal{C}_1 \times \Delta^1) \hookrightarrow \mathcal{E}$ is a categorical equivalence, so that the map $\mathrm{Fun}_{\Delta^1}(\mathcal{E}, \mathcal{D}) \to \mathrm{Fun}(\mathcal{C}, \mathcal{N}_0) \times_{\mathrm{Fun}(\mathcal{C}_1, \mathcal{N}_0)} \mathrm{Fun}(\mathcal{C}_1, \mathcal{D})$ is a trivial Kan fibration. It will therefore suffice to show that the restriction map

$$\theta' : \mathrm{Fun}'(\mathcal{C}, \mathcal{D}) \subseteq \mathrm{Fun}_{\Delta^1}(\mathcal{C} \times \Delta^1, \mathcal{D}) \to \mathrm{Fun}_{\mathcal{D}^1}(\mathcal{E}, \mathcal{D})$$

is a trivial Kan fibration. Note that a functor $F : \mathcal{C} \to \mathcal{D}$ belongs to $\mathrm{Fun}'(\mathcal{C}, \mathcal{D})$ if and only if the induced map $\mathcal{C} \times \Delta^1 \to \mathcal{D}$ is a q-right Kan extension of its restriction to $\mathcal{E}$. It now follows from Proposition HTT.4.3.2.15 that θ' is a trivial Kan fibration. This completes the proof that the lower square in the diagram σ is homotopy Cartesian. It follows that the upper square is also homotopy Cartesian.

Note that the evaluation map $e_0 : \mathcal{C} \to \mathcal{M}_0$ admits a fully faithful right adjoint. It follows that composition with e_0 induces a fully faithful embedding $\mathrm{Fun}(\mathcal{M}_0, \mathcal{N}_0) \to \mathrm{Fun}(\mathcal{C}, \mathcal{N}_0)$, whose essential image is the collection of functors which carry every L_0-equivalence in $\mathcal{C}$ to an equivalence in $\mathcal{N}_0$. Since the diagram

$$\begin{array}{ccc} \mathrm{Fun}_{\Delta^1}(\mathcal{M}, \mathcal{N}) & \longrightarrow & \mathrm{Fun}(\mathcal{M}_0, \mathcal{N}_0) \\ \downarrow & & \downarrow \\ \mathrm{Fun}'(\mathcal{C}, \mathcal{D}) & \longrightarrow & \mathrm{Fun}(\mathcal{C}, \mathcal{N}_0) \end{array}$$

is homotopy Cartesian, we conclude that the functor $\mathrm{Fun}_{\Delta^1}(\mathcal{M}, \mathcal{N}) \to \mathrm{Fun}'(\mathcal{C}, \mathcal{D})$ is fully faithful, and its essential image is spanned by those functors $F \in \mathrm{Fun}'(\mathcal{C}, \mathcal{D})$ which carry each L_0-equivalence in $\mathcal{C}$ to an L_0'-equivalence in $\mathcal{D}$. □

Remark A.8.10. In the situation of Proposition A.8.8, a functor $f : \mathcal{M} \to \mathcal{N}$ induces a left exact functor $F : \mathcal{C} \to \mathcal{D}$ if and only if the underlying maps $f_0 : \mathcal{M}_0 \to \mathcal{N}_0$ and $f_1 : \mathcal{M}_1 \to \mathcal{N}_1$ are left exact. In this case, F automatically carries $\mathcal{C}_0$ into $\mathcal{D}_0$. It carries $\mathcal{C}_1$ into $\mathcal{D}_1$ if and only if the functor f preserves Cartesian edges.

We now prove a converse to Proposition A.8.7:

Proposition A.8.11. Let $\mathcal{C}$ be an ∞-category which admits finite limits, which is a recollement of full subcategories $\mathcal{C}_0, \mathcal{C}_1 \subseteq \mathcal{C}$. Then there exists a left exact correspondence $p : \mathcal{M} \to \Delta^1$ and an equivalence of ∞-categories $\mathcal{C} \to \mathrm{Fun}_{\Delta^1}(\Delta^1, \mathcal{M})$, such that $\mathcal{C}_0$ and $\mathcal{C}_1$ are the essential images of left adjoints to the induced localization functors $\mathcal{C} \to \mathcal{M}_0$ and $\mathcal{C} \to \mathcal{M}_1$.

小红书
小红书号:3189205503 qq

Proof. Let $\mathcal{M}_0 = \mathcal{C}_0$, and let $\mathcal{M}_1$ be the full subcategory of $\mathrm{Fun}(\Delta^1, \mathcal{C})$ spanned by those morphisms $f : C \to C'$ such that $C \in \mathcal{C}_1$ and f exhibits C' as a $\mathcal{C}_0$-localization of C. Evaluation at $\{1\} \subseteq \Delta^1$ determines a map $\mathcal{M}_1^{op} \to \mathcal{M}_0^{op}$, which we can view as a functor $\theta : [1] \to \mathcal{S}\mathrm{et}_\Delta$. Let $\mathcal{M} = \mathrm{N}_\theta([1])^{op}$ denote the (opposite of the) nerve of the category $[1]$ relative to θ (see Definition HTT.3.2.5.2), so that we have a Cartesian fibration $p : \mathcal{M} \to \Delta^1$ together with isomorphisms

$$\mathcal{M} \times_{\Delta^1} \{0\} \simeq \mathcal{M}_0 \qquad \mathcal{M} \times_{\Delta^1} \{1\} \simeq \mathcal{M}_1,$$

such that the associated functor $\mathcal{M}_1 \to \mathcal{M}_0$ is given by the evaluation.

Unwinding the definitions, we see that $\mathcal{D} = \mathrm{Fun}_{\Delta^1}(\Delta^1, \mathcal{M})$ is isomorphic to the full subcategory of $\mathrm{Fun}(\Lambda^2_2, \mathcal{C})$ spanned by those diagrams $C_0 \to C_{01} \xleftarrow{g} C_1$ satisfying the following conditions:

(i) The object C_0 belongs to $\mathcal{C}_0$ and the object C_1 belongs to $\mathcal{C}_1$.

(ii) The morphism g exhibits C_{01} as a $\mathcal{C}_0$-localization of C_1.

Let $\overline{\mathcal{D}}$ be the full subcategory of $\mathrm{Fun}(\Delta^1 \times \Delta^1, \mathcal{C})$ spanned by those diagrams τ :

$$\begin{array}{ccc} C & \longrightarrow & C_1 \\ \downarrow & & \downarrow{\scriptstyle g} \\ C_0 & \longrightarrow & C_{01} \end{array}$$

satisfying (i) and (ii) together with the following:

(iii) The diagram τ is a pullback square in $\mathcal{C}$.

Using Proposition HTT.4.3.2.15 , we deduce that the evident restriction functor $\overline{\mathcal{D}} \to \mathcal{D}$ is a trivial Kan fibration. We will need the following fact:

($*$) Evaluation at $(0,0) \in \Delta^1 \times \Delta^1$ induces a trivial Kan fibration $e : \overline{\mathcal{D}} \to \mathcal{C}$.

To prove this, we let $\overline{\mathcal{D}}' \subseteq \overline{\mathcal{D}}$ denote the full subcategory spanned by those diagrams τ which satisfy the following additional conditions:

(iv) The map $C \to C_0$ exhibits C_0 is a $\mathcal{C}_0$-localization of C.

(v) The map $C \to C_1$ exhibits C_1 as a $\mathcal{C}_1$-localization of C.

Let $\overline{\mathcal{D}}''$ denote the full subcategory of $\mathrm{Fun}(\Delta^1 \times \Delta^1, \mathcal{C})$ spanned by those functors satisfying conditions (i), (ii), (iv), and (v). Let $\overline{\mathcal{C}}$ denote the full subcategory of $\mathcal{C} \times \Delta^1 \times \Delta^1$ spanned by those objects (C, i, j) such that $C \in \mathcal{C}_0$ if $i = 1$ and $C \in \mathcal{C}_1$ if $0 = i < j = 1$. Let $q : \overline{\mathcal{C}} \to \Delta^1 \times \Delta^1$ denote the projection map, and $q_0 : \overline{\mathcal{C}} \times_{\Delta^1 \times \Delta^1} (\{0\} \times \Delta^1) \to \{0\} \times \Delta^1$ the restriction of q. Note that $\overline{\mathcal{D}}''$ can be identified with the ∞-category of functors $F \in \mathrm{Fun}_{\Delta^1 \times \Delta^1}(\Delta^1 \times \Delta^1, \overline{\mathcal{C}})$ such that F is a q-left Kan extension of $F_0 = F|(\{0\} \times \Delta^1)$ and F_0 is a q_0-left Kan extension of $F|\{(0,0)\}$. It

小红书
小红书号:3189205503 qq

follows from Proposition HTT.4.3.2.15 that the evaluation map $\overline{\mathcal{D}}'' \to \mathcal{C}$ is a trivial Kan fibration. We will prove $(*)$ by verifying that $\overline{\mathcal{D}} = \overline{\mathcal{D}}' = \overline{\mathcal{D}}''$.

To prove that $\overline{\mathcal{D}}' = \overline{\mathcal{D}}''$, consider a diagram σ :

$$\begin{array}{ccc} C & \longrightarrow & L_1(C) \\ \downarrow & & \downarrow \\ L_0(C) & \longrightarrow & (L_0 L_1)(C) \end{array}$$

belonging to $\overline{\mathcal{D}}''$. This diagram induces a map $\alpha : C \to L_0(C) \times_{(L_0 L_1)(C)} L_1(C)$. To prove that $\sigma \in \overline{\mathcal{D}}'$, we must show that α is an equivalence. For this, it suffices to show that both $L_0(\alpha)$ and $L_1(\alpha)$ are equivalences. Since L_0 and L_1 are left exact, we are reduced to proving that the diagrams $L_0(\sigma)$ and $L_1(\sigma)$ are pullback squares. This is clear: in the diagram $L_0(\sigma)$, the vertical maps are both equivalences; in the diagram $L_1(\sigma)$, the horizontal maps are both equivalences.

To show that $\overline{\mathcal{D}} = \overline{\mathcal{D}}'$, consider an arbitrary diagram σ :

$$\begin{array}{ccc} C & \longrightarrow & C_1 \\ \downarrow & & \downarrow \\ C_0 & \longrightarrow & C_{01} \end{array}$$

satisfying conditions (i) through (iii). Since L_0 is left exact, we obtain a pullback diagram

$$\begin{array}{ccc} L_0(C) & \longrightarrow & L_0(C_1) \\ \downarrow & & \downarrow \\ L_0(C_0) & \longrightarrow & L_0(C_{01}). \end{array}$$

The right vertical map is an equivalence by assumption (ii), so the left vertical map is also an equivalence. Since $C_0 \in \mathcal{C}_0$ by (i), σ satisfies (iv). Similarly, since the functor L_1 is left exact, we have a pullback diagram

$$\begin{array}{ccc} L_1(C) & \longrightarrow & L_1(C_1) \\ \downarrow & & \downarrow \\ L_1(C_0) & \longrightarrow & L_1(C_{01}). \end{array}$$

Since $C_0, C_{01} \in \mathcal{C}_0$, the lower horizontal map is a morphism between final objects of $\mathcal{C}$ and therefore an equivalence. It follows that the upper horizontal map is an equivalence. Since $C_1 \in \mathcal{C}_1$, we conclude that σ satisfies (v). This completes the proof of $(*)$.

Choose a section $s : \mathcal{C} \to \overline{\mathcal{D}}$ of the projection map e, and let ψ denote the composite map $\mathcal{C} \xrightarrow{s} \overline{\mathcal{D}} \to \mathcal{D}$, where s is a section of e. Then ψ is an equivalence of ∞-categories, which carries an object $C \in \mathcal{C}$ to the diagram

$$L_0(C) \to (L_0 \circ L_1)(C) \leftarrow L_1(C).$$

小红书
小红书号:3189205503 qq

We claim that ψ has the desired properties. To verify this, consider full subcategories $\mathcal{D}_0, \mathcal{D}_1 \subseteq \mathcal{D}$ as in Proposition A.8.7. We must show that $\mathcal{C}_0 = \psi^{-1}\mathcal{D}_0$ and $\mathcal{C}_1 = \psi^{-1}\mathcal{D}_1$. The equality $\mathcal{C}_0 = \psi^{-1}\mathcal{D}_0$ follows from the observation that $C \in \mathcal{C}_0$ if and only if $L_1(C)$ is a final object of $\mathcal{C}_1$ (Remark A.8.5). To prove that $\mathcal{C}_1 = \psi^{-1}\mathcal{D}_1$, we must show that an object $C \in \mathcal{C}$ belongs to $\mathcal{C}_1$ if and only if the map $\alpha : L_0(C) \to (L_0 \circ L_1)(C)$ is an equivalence. The "only if" direction is obvious. Conversely, suppose that α is satisfied. The proof of $(*)$ shows that the diagram

$$\begin{array}{ccc} C & \xrightarrow{\alpha'} & L_1(C) \\ \downarrow & & \downarrow \\ L_0(C) & \xrightarrow{\alpha} & (L_0 L_1)(C) \end{array}$$

is a pullback square, so that α' is an equivalence and $C \simeq L_1(C)$ belongs to $\mathcal{C}_1$. □

Remark A.8.12. Propositions A.8.7, A.8.8, and A.8.11 can be informally summarized by saying that, for every pair of ∞-categories $\mathcal{C}_0$ and $\mathcal{C}_1$ which admit finite limits, the following types of data are equivalent:

(a) An ∞-category $\mathcal{C}$ which is a recollement of $\mathcal{C}_0$ and $\mathcal{C}_1$.

(b) A left exact functor from $\mathcal{C}_1$ to $\mathcal{C}_0$.

Corollary A.8.13. Let $\mathcal{C}$ be an ∞-category which admits finite limits, which is a recollement of full subcategories $\mathcal{C}_0, \mathcal{C}_1 \subseteq \mathcal{C}$. Let j_* denote the inclusion of $\mathcal{C}_1$ into $\mathcal{C}$, and let j^* denote a left adjoint to j_*. Suppose that the ∞-category $\mathcal{C}_0$ has an initial object. Then the functor j^* admits a fully faithful left adjoint $j_! : \mathcal{C}_1 \to \mathcal{C}$.

Proof. By virtue of Proposition A.8.11, we may assume that there exists a left exact correspondence $q : \mathcal{M} \to \Delta^1$ such that $\mathcal{C} = \mathrm{Fun}_{\Delta^1}(\Delta^1, \mathcal{M})$, where $\mathcal{C}_1$ is the full subcategory spanned by the Cartesian sections. Then we can identify j^* with the evaluation functor $\mathcal{C} \to \mathcal{M}_1$. By assumption, $\mathcal{M}_0 \simeq \mathcal{C}_0$ has an initial object. Sine q is a Cartesian fibration, this object is also q-initial. It follows that every map $\{1\} \to \mathcal{M}_1$ admits a q-left Kan extension in $\mathrm{Fun}_{\Delta^1}(\Delta^1, \mathcal{M})$, so that j^* admits a left adjoint $j_!$. This functor is fully faithful by Proposition HTT.4.3.2.15 . □

If an ∞-category $\mathcal{C}$ is a recollement of full subcategories $\mathcal{C}_0, \mathcal{C}_1 \subseteq \mathcal{C}$, we can often reduce questions about $\mathcal{C}$ to questions about $\mathcal{C}_0$ and $\mathcal{C}_1$. Our next result provides an example of this phenomenon.

Proposition A.8.14. Let $\mathcal{C}$ and $\mathcal{C}'$ be ∞-categories which admit finite limits. Suppose that we are given inclusions of full subcategories

$$\mathcal{C}_0, \mathcal{C}_1 \subseteq \mathcal{C} \qquad \mathcal{C}'_0, \mathcal{C}'_1 \subseteq \mathcal{C}'$$

which admit left adjoints L_0, L_1, L'_0, and L'_1. Let $F : \mathcal{C} \to \mathcal{C}'$ be a functor satisfying the following conditions:

小红书
小红书号:3189205503 qq

(1) The ∞-category $\mathcal{C}$ is a recollement of $\mathcal{C}_0$ and $\mathcal{C}_1$, and the ∞-category $\mathcal{C}'$ is a recollement of $\mathcal{C}'_0$ and $\mathcal{C}'_1$.

(2) The functor F restricts to equivalences $\mathcal{C}_0 \to \mathcal{C}'_0$ and $\mathcal{C}_1 \to \mathcal{C}'_1$.

(3) The functor F is left exact.

(4) Let $C \in \mathcal{C}_1$ and $\alpha : C \to C'$ be a morphism in $\mathcal{C}$ which exhibits C' as a $\mathcal{C}_0$-localization of C. Then $F(\alpha)$ exhibits $F(C') \in \mathcal{C}'_0$ as a $\mathcal{C}'_0$-localization of $F(C) \in \mathcal{C}'_1 \subseteq \mathcal{C}$.

Then F is an equivalence of ∞-categories.

Proof. Let $\psi : \mathcal{C} \to \mathcal{D}$ be defined as in the proof of Proposition A.8.11 and let $\psi' : \mathcal{C}' \to \mathcal{D}'$ be defined similarly, so that we have a commutative diagram of ∞-categories

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{F} & \mathcal{C}' \\ \downarrow{\scriptstyle \psi} & & \downarrow{\scriptstyle \psi'} \\ \mathcal{D} & \xrightarrow{F_0} & \mathcal{D}'. \end{array}$$

The proof of Proposition A.8.11 shows that ψ and ψ' are equivalences of ∞-categories. It will therefore suffice to show that F_0 is an equivalence of ∞-categories. The map F_0 extends to a map of (homotopy) pullback diagrams

$$\begin{array}{ccc} \mathcal{D} & \longrightarrow & \mathrm{Fun}(\Delta^1, \mathcal{C}_0) \\ \downarrow & & \downarrow \\ \mathcal{M} & \longrightarrow & \mathrm{Fun}(\{0\}, \mathcal{C}_0) \end{array} \qquad \begin{array}{ccc} \mathcal{D}' & \longrightarrow & \mathrm{Fun}(\Delta^1, \mathcal{C}'_0) \\ \downarrow & & \downarrow \\ \mathcal{M}' & \longrightarrow & \mathrm{Fun}(\{0\}, \mathcal{C}'_0), \end{array}$$

where $\mathcal{M}$ is denotes the full subcategory of $\mathcal{C}$ spanned by those morphisms $f : C_1 \to C_{01}$ such that $C_1 \in \mathcal{C}_1$ and f exhibits C_{01} as a $\mathcal{C}$-colocalization of C_1, and $\mathcal{M}'$ is defined similarly. Since F induces an equivalence $\mathcal{C}_0 \to \mathcal{C}'_0$ by assumption, it suffices to show that the map $\mathcal{M} \to \mathcal{M}'$ (which is well-defined by virtue of (3)) is an equivalence of ∞-categories. This follows from the assumption that F restricts to an equivalence $\mathcal{C}_1 \to \mathcal{C}'_1$, since we have a commutative diagram

$$\begin{array}{ccc} \mathcal{M} & \longrightarrow & \mathcal{M}' \\ \downarrow & & \downarrow \\ \mathcal{C}_1 & \longrightarrow & \mathcal{C}'_1 \end{array}$$

in which the vertical maps are trivial Kan fibrations. □

We now consider an ∞-categorical analogue of Example A.8.4:

小红书
小红书号:3189205503 qq

Proposition A.8.15. Let $\mathcal{X}$ be an ∞-category which admits finite limits, and suppose that $\mathcal{X}$ is a recollement of full subcategories $\mathcal{X}_0, \mathcal{X}_1 \subseteq \mathcal{X}$. Let $L_0 : \mathcal{X} \to \mathcal{X}_0$ and $L_1 : \mathcal{X} \to \mathcal{X}_1$ be left adjoints to the inclusion. Then the following conditions are equivalent:

(1) The ∞-category $\mathcal{X}$ is an ∞-topos.

(2) The ∞-categories $\mathcal{X}_0 = L_0 \mathcal{X}$ and $\mathcal{X}_1 = L_1 \mathcal{X}$ are ∞-topoi, and the functor $(L_0 | \mathcal{X}_1) : \mathcal{X}_1 \to \mathcal{X}_0$ is accessible.

If these conditions are satisfied, then there exists a (-1)-truncated object $U \in \mathcal{X}$ with the following properties:

(i) A morphism $f : X \to Y$ in $\mathcal{X}$ is an L_1-equivalence if and only if $X \times U \to Y \times U$ is an equivalence (consequently, $\mathcal{X}_1$ is equivalent to the ∞-topos $\mathcal{X}_{/U}$).

(ii) The ∞-category $\mathcal{X}_0$ is the closed subtopos $\mathcal{X}/U \subseteq \mathcal{X}$.

Remark A.8.16. Fix a pair of ∞-topoi $\mathcal{U}$ and $\mathcal{Y}$. Suppose we are given an ∞-topos $\mathcal{X}$ equipped with a (-1)-truncated object $U \in \mathcal{X}$, together with equivalences of ∞-topoi $\mathcal{U} \simeq \mathcal{X}_{/U}$ and $\mathcal{Y} \simeq \mathcal{X}/U$. This data determines geometric morphisms of ∞-topoi

$$\mathcal{U} \xrightarrow{j_*} \mathcal{X} \xleftarrow{i_*} \mathcal{Y},$$

so that $i^* j_*$ is an accessible left exact functor from $\mathcal{U}$ to $\mathcal{Y}$. Proposition A.8.15 provides a converse: a left exact accessible functor $F : \mathcal{U} \to \mathcal{Y}$ determines an ∞-topos $\mathcal{X}$ which is "glued" from $\mathcal{U}$ and $\mathcal{Y}$. Moreover, the data of F is equivalent to the data of diagram of geometric morphisms $\mathcal{U} \xrightarrow{j_*} \mathcal{X} \xleftarrow{i_*} \mathcal{Y}$.

Proof of Proposition A.8.15. Suppose first that condition (1) is satisfied. Let $\emptyset$ denote an initial object of $\mathcal{X}$ and $\mathbf{1}$ a final object of $\mathcal{X}$, and set $U = L_0(\emptyset)$. Since $\mathcal{X}$ is an ∞-topos, the morphism $\emptyset \to \mathbf{1}$ is (-1)-truncated. We will prove that U satisfies conditions (i) and (ii). It follows that $L_0 | \mathcal{X}_1$ can be identified with the composition

$$\mathcal{X}_{/U} \xrightarrow{j_*} \mathcal{X} \xrightarrow{i^*} \mathcal{X}/U,$$

and is therefore an accessible functor.

Because L_0 is left exact, we deduce that the canonical map $U = L_0(\emptyset) \to L_0(\mathbf{1}) \simeq \mathbf{1}$ is (-1)-truncated: that is, U is a (-1)-truncated object of $\mathcal{X}$. Note that if $X \in \mathcal{X}$ is an object which admits a morphism $f : X \to U$, then

$$L_0(X) \simeq L_0(X) \times_{L_0(U)} L_0(\emptyset) \simeq L_0(X \times_U \emptyset) \simeq L_0(\emptyset) = U$$

is an initial object of $L_0 \mathcal{X}$.

Let X be an object of $\mathcal{X}$, and consider the map $u_X : X \times_{L_0(X)} U \to X \times U$. Using condition ($d$) of Definition A.8.1, we obtain $L_1(L_0(X)) \simeq \mathbf{1}$. Since L_1 is left exact, we conclude that $L_1(u_X)$

小红书
小红书号:3189205503 qq

is an equivalence. Since both $X \times_{L_0(X)} U$ and $X \times U$ admit a map to U, $L_0(u_X)$ is a map between initial objects of $L_0 \mathcal{X}$ and therefore an equivalence. Using condition (e) of Definition A.8.1, we conclude that u_X is an equivalence.

We now verify (i). Suppose that $f : X \to Y$ is a morphism in $\mathcal{X}$ such that $f \times \mathrm{id}_U$ is an equivalence. Then the composition

$$\begin{aligned} L_1(X) &\simeq L_1(X) \times \mathbf{1} \\ &\simeq L_1(X) \times L_1(U) \\ &\simeq L_1(X \times U) \\ &\to L_1(Y \times U) \\ &\simeq L_1(Y) \times L_1(U) \\ &\simeq L_1(Y) \times \mathbf{1} \\ &\simeq L_1(Y) \end{aligned}$$

is an equivalence. Conversely, suppose that $L_1(f)$ is an equivalence. Consider the diagram

$$\begin{array}{ccccc} X & \xrightarrow{f} & Y & \longrightarrow & L_1(Y) \\ \downarrow & & \downarrow & & \downarrow \\ L_0(X) & \longrightarrow & L_0(Y) & \longrightarrow & (L_0 L_1)(Y). \end{array}$$

The proof of Proposition A.8.11 shows that the outer rectangle and the right square are pullbacks, so that the left square is also a pullback. It follows that the map $X \times_{L_0 X} Y \to Y \times_{L_0 Y} U$ is an equivalence, so that by the above argument we conclude that $X \times U \to Y \times U$ is an equivalence. This completes the proof of (i). Assertion (ii) now follows from Remark A.8.5 and the definition of the ∞-topos $\mathcal{X}/U$.

We now complete the proof by showing that (2) $\Rightarrow$ (1). Assume that $\mathcal{X}_0$ and $\mathcal{X}_1$ are ∞-topoi and that $L_0 | \mathcal{X}_1$ is an accessible functor from $\mathcal{X}_1$ to $\mathcal{X}_0$. We will prove that $\mathcal{X}$ is an ∞-topos. Using Proposition A.8.11, we may assume without loss of generality that $\mathcal{X}$ is the ∞-category of sections of a left exact correspondence $\mathcal{M} \to \Delta^1$ with $\mathcal{M}_0 \simeq \mathcal{X}_0$, $\mathcal{M}_1 \simeq \mathcal{X}_1$, associated to a left exact accessible functor $F : \mathcal{M}_1 \to \mathcal{M}_0$. Since the fibers of p admit small colimits, we deduce that $\mathcal{X}$ admits small colimits (and is therefore a presentable ∞-category) and the evaluation functors $e_0 : \mathcal{X} \to \mathcal{M}_0$ and $e_1 : \mathcal{X} \to \mathcal{M}_1$ preserve small colimits. Since F is left exact, finite limits in $\mathcal{X}$ are computed pointwise: that is, the evaluation functors e_0 and e_1 are left exact. We now prove that $\mathcal{X}$ is an ∞-topos by verifying the ∞-categorical versions of Giraud's axioms (see Theorem HTT.6.1.0.6):

(i) The ∞-category $\mathcal{X}$ is presentable. Since $\mathcal{X}$ admits small limits, it will suffice to show that $\mathcal{X}$ is accessible. This follows from Corollary HTT.5.4.7.17 , since $\mathcal{M}_0$ and $\mathcal{M}_1$ are both accessible and the functor F is accessible.

小红书
小红书号:3189205503 qq

(*ii*) Colimits in $\mathcal{X}$ are universal. Suppose we are given a diagram $\{X_\alpha\}$ in $\mathcal{X}$ having a colimit X and a morphism $Y \to X$ in $\mathcal{X}$; we wish to show that the canonical map $v : \varinjlim(Y \times_X X_\alpha) \to Y$ is an equivalence. For this, it suffices to show that $e_i(v)$ is an equivalence in $\mathcal{M}_i$ for $i \in \{0, 1\}$. Since e_i is left exact and commutes with small colimits, we can identify $e_i(v)$ with the map $\varinjlim e_i(Y) \times_{e_i(X)} e_i(X_\alpha) \to e_i(Y)$, which is an equivalence since colimits are universal in the ∞-topos $\mathcal{M}_i$.

(*iii*) Coproducts in $\mathcal{X}$ are disjoint. Suppose we are given objects $X, Y \in \mathcal{X}$; we wish to show that the fiber product $X \times_{X \coprod Y} Y$ is an initial object of $\mathcal{X}$. For this, it suffices to show that $e_i(X \times_{X \coprod Y} Y)$ is an initial object of $\mathcal{M}_i$ for $i \in \{0, 1\}$. Since e_i is left exact and commutes with coproducts, we are reduced to proving that $e_i(X) \times_{e_i(X) \coprod e_i(Y)} e_i(Y)$ is an initial object of $\mathcal{M}_i$, which follows from the fact that coproducts are disjoint in the ∞-topos $\mathcal{M}_i$.

(*iv*) Every groupoid object of $\mathcal{X}$ is effective. Let $X_\bullet$ be a groupoid object of $\mathcal{X}$ having geometric realization $X \in \mathcal{X}$. We wish to show that the canonical map $w : X_1 \to X_0 \times_X X_0$ is an equivalence in $\mathcal{X}$. For this, it suffices to show that $e_i(w)$ is an equivalence for $i \in \{0, 1\}$. Since e_i is left exact and commutes with geometric realizaiton, we are reduced to proving that $e_i(X_1) \to e_i(X_0) \times_{|e_i(X_\bullet)|} e_i(X_0)$ is an equivalence. Since e_i is left exact, $e_i(X_\bullet)$ is a groupoid object of $\mathcal{M}_i$, which is effective by virtue of the fact that $\mathcal{M}_i$ is an ∞-topos.

□

We now turn our attention to the case of stable ∞-categories. We have the following analogue of Proposition A.8.15:

Proposition A.8.17. Let $\mathcal{C}$ be an ∞-category which admits finite limits, and suppose that $\mathcal{C}$ is a recollement of full subcategories $\mathcal{C}_0, \mathcal{C}_1 \subseteq \mathcal{X}$. Let $L_0 : \mathcal{C} \to \mathcal{C}_0$ and $L_1 : \mathcal{C} \to \mathcal{C}_1$ be left adjoints to the inclusion. Then the following conditions are equivalent:

(1) The ∞-category $\mathcal{C}$ is stable.

(2) The ∞-categories $\mathcal{C}_0$ and $\mathcal{C}_1$ are stable, and the functor $L_0 | \mathcal{C}_1$ is exact.

Proof. The implication (2) $\Rightarrow$ (1) follows from Proposition A.8.11. Conversely, suppose that (1) is satisfied. Since L_0 and L_1 are exact functors from $\mathcal{C}$ to itself, their essential images $\mathcal{C}_0, \mathcal{C}_1 \subseteq \mathcal{C}$ are closed under suspension and therefore (since they are also closed under finite limits) are stable subcategories of $\mathcal{C}$. It follows that $\mathcal{C}_0$ and $\mathcal{C}_1$ are stable ∞-categories. Since L_0 is left exact, the restriction $L_0 | \mathcal{C}_1$ is exact. □

Remark A.8.18. Let $\mathcal{C}_0$ and $\mathcal{C}_1$ be stable ∞-categories. Using Propositions A.8.8, A.8.11, and A.8.17, we see that the following types of data are equivalent:

(*a*) Stable ∞-categories $\mathcal{C}$ which are recollement of $\mathcal{C}_0$ and $\mathcal{C}_1$.

小红书
小红书号:3189205503 qq

(b) Exact functors from $\mathcal{C}_1$ to $\mathcal{C}_0$.

Remark A.8.19. Let $\mathcal{C}$ be a stable ∞-category which is a recollement of full subcategories $\mathcal{C}_0$ and $\mathcal{C}_1$. Let $i_* : \mathcal{C}_0 \to \mathcal{C}$ and $j_* : \mathcal{C}_1 \to \mathcal{C}$ denote the inclusion functors, so that i_* and j_* admit left adjoints i^* and j^*. It follows from Remark A.8.5 and Corollary A.8.13 that the functor i_* admits a right adjoint $i^!$, and the functor j^* admits a fully faithful left adjoint $j_!$. We can summarize the situation with the following diagram:

$$\mathcal{C}_0 \underset{i^*}{\overset{i^!}{\underset{\longleftarrow}{\overset{\longrightarrow}{\longleftarrow}}}} \mathcal{C} \underset{j^*}{\overset{j_!}{\underset{\longleftarrow}{\overset{\longrightarrow}{\longleftarrow}}}} \mathcal{C}_1$$

We conclude this section by establishing a converse to Remark A.8.19:

Proposition A.8.20. Let $\mathcal{C}$ be a stable ∞-category and let $\mathcal{C}_0 \subseteq \mathcal{C}$ be a full subcategory which is closed under equivalence. The following conditions are equivalent:

(1) The inclusion functor $i_* : \mathcal{C}_0 \hookrightarrow \mathcal{C}$ admits left and right adjoints.

(2) There exists a full subcategory $\mathcal{C}_1 \subseteq \mathcal{C}$ such that $\mathcal{C}$ is a recollement of $\mathcal{C}_0$ and $\mathcal{C}_1$.

Moreover, if these conditions are satisfied, then we can identify $\mathcal{C}_1$ with the full subcategory $\mathcal{C}_0^{\perp} \subseteq \mathcal{C}$ spanned by those objects Y such that the mapping space $\mathrm{Map}_{\mathcal{C}}(X, Y)$ is contractible for each $X \in \mathcal{C}_0$.

Proof. Suppose first that there exists a full subcategory $\mathcal{C}_1 \subseteq \mathcal{C}$ such that $\mathcal{C}$ is a recollement of $\mathcal{C}_0$ and $\mathcal{C}_1$. Let $j_* : \mathcal{C}_1 \hookrightarrow \mathcal{C}$ be the inclusion map, and $j^* : \mathcal{C} \to \mathcal{C}_1$ its left adjoint. Then j^* annihilates $\mathcal{C}_0$, so that $\mathcal{C}_1 \subseteq \mathcal{C}_0^{\perp}$. Conversely, suppose that $Y \in \mathcal{C}_0^{\perp}$, and let $u : Y \to j_* j^* Y$ denote the unit map. Then $j^* \mathrm{fib}(u) \simeq 0$. It follows that the canonical map $\alpha : \mathrm{fib}(u) \to i_* i^* \mathrm{fib}(u)$ is an equivalence after applying j. Since $i^* \alpha$ is an equivalence, we conclude that α is an equivalence: that is, $\mathrm{fib}(u) \in \mathcal{C}_0$. Since the domain and codomain of u belong to $\mathcal{C}_0^{\perp}$, we have $\mathrm{fib}(u) \in \mathcal{C}_0^{\perp}$, so that $\mathrm{fib}(u) \simeq 0$. It follows that u is an equivalence, so that $Y \simeq j_* j^* Y \in \mathcal{C}_1$. This proves that $\mathcal{C}_1 = \mathcal{C}_0^{\perp}$. The existence of a right adjoint to i_* follows from Remark A.8.5, which proves (1).

Now suppose that (1) is satisfied. We will show that $\mathcal{C}$ is a recollement of $\mathcal{C}_0$ and $\mathcal{C}_0^{\perp}$ by verifying the requirements of Definition A.8.1:

(a) The full subcategory $\mathcal{C}_0 \subseteq \mathcal{C}$ is closed under equivalence by assumption, and $\mathcal{C}_0^{\perp} \subseteq \mathcal{C}$ is clearly closed under equivalence.

(b) By assumption, the inclusion functor $i_* : \mathcal{C}_0 \to \mathcal{C}$ admits a left adjoint i^* and a right adjoint $i^!$. We wish to show that the inclusion $j_* : \mathcal{C}_0^{\perp} \to \mathcal{C}$ admits a left adjoint. Fix an object $C \in \mathcal{C}$; we wish to show that there exists a $\mathcal{C}_0^{\perp}$-localization of C. Let $v : i_* i^! C \to C$ be the counit map. We claim that $\mathrm{cofib}(v)$ is a $\mathcal{C}_0^{\perp}$-localization of $\mathcal{C}$. To prove this, we first show

小红书 小红书号:3189205503 qq

that $\mathrm{cofib}(v) \in \mathcal{C}_0^{\perp}$: that is, for every object $X \in \mathcal{C}_0$, the mapping space $\mathrm{Map}_{\mathcal{C}}(X, \mathrm{cofib}(v))$ is contractible. We have a fiber sequence of spaces

$$\mathrm{Map}_{\mathcal{C}}(X, \mathrm{cofib}(v)) \to \mathrm{Map}_{\mathcal{C}}(X, \Sigma i_* i^! C) \xrightarrow{\beta} \mathrm{Map}_{\mathcal{C}}(X, \Sigma C)$$

We have

$$\mathrm{Map}_{\mathcal{C}}(X, \Sigma i_* i^! C) \simeq \mathrm{Map}_{\mathcal{C}_0}(i^* X, \Sigma i^! C) \simeq \mathrm{Map}_{\mathcal{C}}(i_* i^* X, \Sigma C),$$

so that β is a homotopy equivalence by virtue of the fact that the unit map $X \to i_* i^* X$ is an equivalence (since $X \in \mathcal{C}_0$).

We now claim that for every object $Y \in \mathcal{C}_0^{\perp}$, the canonical map $\mathrm{Map}_{\mathcal{C}}(\mathrm{cofib}(v), Y) \to \mathrm{Map}_{\mathcal{C}}(C, Y)$ is a homotopy equivalence. For this, it suffices to show that $\mathrm{Map}_{\mathcal{C}}(i_* i^! C, Y)$ is contractible, which follows immediately from our assumption that $Y \in \mathcal{C}_0^{\perp}$.

(c) Let j^* denote a left adjoint to j_*. Then j_* is left exact and j^* is right exact. Since the ∞-categories $\mathcal{C}$ and $\mathcal{C}_0^{\perp}$ are stable, j_* and j^* are exact, so that the localization functor $L_1 = j_* j^* : \mathcal{C} \to \mathcal{C}$ is exact. Similarly, the functor $L_0 = i_* i^* : \mathcal{C} \to \mathcal{C}$ is exact.

(d) Fix an object $C \in \mathcal{C}_0$; we wish to prove that $j^* C \simeq 0$. The proof of (b) shows that $j^* C$ can be identified with the cofiber of the counit map $i_* i^! C \to C$. Since the functor i_* is fully faithful, this follows from our assumption that C belongs to the essential image of i_*.

(e) Let α be a morphism in $\mathcal{C}$ such that $i^*(\alpha)$ and $j^*(\alpha)$ are equivalences; we wish to show that α is an equivalence. Let $C = \mathrm{fib}(\alpha)$; we wish to prove that $C = 0$. We have $j^*(C) \simeq 0$, so that the counit map $i_* i^! C \to C$ is an equivalence. It follows that C belongs to the essential image of i_*, so that the unit map $C \to i_* i^* C$ is an equivalence. Since $i^* C \simeq 0$, we conclude that $C \simeq 0$.

□

A.9 Exit Paths and Constructible Sheaves

Let A be a partially ordered set and let X be a space equipped with an A-stratificatin $f : X \to A$. Our goal in this section is to prove that, if X is sufficiently well-behaved, then the ∞-category of A-constructible objects of $\mathcal{S}\mathrm{hv}(X)$ can be identified with the ∞-category $\mathrm{Fun}(\mathrm{Sing}^A(X), \mathcal{S})$, where $\mathrm{Sing}^A(X)$ is the ∞-category of exit paths defined in §A.6. In fact, we will give an explicit construction of this equivalence, generalizing the analysis we carried out for locally constant sheaves in §A.4. First, we need to establish a bit of terminology.

Notation A.9.1. Let A be a partially ordered set and let X be a paracompact A-stratified space. We let $\mathbf{A}_X$ denote the category $(\mathcal{S}\mathrm{et}_{\Delta})_{/\mathrm{Sing}^A(X)}$, which we regard as endowed with the covariant

小红书 小红书号:3189205503 qq

model structure described in §HTT.2.1.4. Let $\mathcal{B}(X)$ denote the partially ordered collection of all open F_σ subsets of X. We let $\mathcal{S}\mathrm{hv}(X)$ denote the full subcategory of $\mathcal{P}(\mathcal{B}(X))$ spanned by those objects which are sheaves with respect to the natural Grothendieck topology on $\mathcal{B}(X)$.

Proposition HTT.4.2.4.4 and Theorem HTT.2.2.1.2 furnish a chain of equivalences of ∞-categories

$$\mathrm{Fun}(\mathrm{Sing}^A(X), \mathcal{S}) \leftarrow \mathrm{N}((\mathcal{S}\mathrm{et}_\Delta^{\mathfrak{C}[\mathrm{Sing}^A(X)]})^{\mathrm{o}}) \rightarrow \mathrm{N}(\mathbf{A}_X^{\mathrm{o}}).$$

Construction A.9.2. We define a functor $\theta : \mathcal{B}(X)^{op} \times \mathbf{A}_X \to \mathcal{S}\mathrm{et}_\Delta$ by the formula

$$\theta(U, Y) = \mathrm{Fun}_{\mathrm{Sing}^A(X)}(\mathrm{Sing}^A(U), Y).$$

Note that if $Y \in \mathbf{A}_X$ is fibrant, then $Y \to \mathrm{Sing}^A(X)$ is a left fibration so that each of the simplicial sets $\theta(U, Y)$ is a Kan complex. Passing to the nerve, θ induces a map of ∞-categories $\mathrm{N}(\mathcal{B}(X)^{op}) \times \mathrm{N}(\mathbf{A}_X^{\mathrm{o}}) \to \mathcal{S}$, which we will identify with a map of ∞-categories

$$\Psi_X : \mathrm{N}(\mathbf{A}_X^{\mathrm{o}}) \to \mathcal{P}(\mathcal{B}(X)).$$

We are now ready to state the main result of this section.

Theorem A.9.3. Let X be a paracompact topological space which is locally of singular shape and is equipped with a conical A-stratification, where A is a partially ordered set satisfying the ascending chain condition. Then the functor Ψ_X induces an equivalence $\mathrm{N}(\mathbf{A}_X^{\mathrm{o}}) \to \mathcal{S}\mathrm{hv}^A(X)$.

The proof of Theorem A.9.3 will be given at the end of this section, after we have developed a number of preliminary ideas. For later use, we record the following easy consequence of Theorem A.9.3:

Corollary A.9.4. Let X be a paracompact topological space which is locally of singular shape and is equipped with a conical A-stratification, where A is a partially ordered set satisfying the ascending chain condition. Then the inclusion $i : \mathrm{Sing}^A(X) \hookrightarrow \mathrm{Sing}(X)$ is a weak homotopy equivalence of simplicial sets.

Proof. Let X' denote the topological space X equipped with the trivial stratification. The inclusion i induces a pullback functor $i^* : \mathrm{N}(\mathbf{A}'^{\mathrm{o}}_X) \to \mathrm{N}(\mathbf{A}_X^{\mathrm{o}})$, and we have an evident natural transformation $\alpha : \Psi_X \circ i^* \to \Psi_{X'}$ from $\mathrm{N}(\mathbf{A}'^{\mathrm{o}}_X)$ to $\mathcal{S}\mathrm{hv}(X)$. We claim that α is an equivalence. Since both functors take values in the full subcategory of hypercomplete objects of $\mathcal{S}\mathrm{hv}(X)$ (Lemma A.9.10 and Proposition A.5.9), it suffices to show that $\alpha(Y)$ is ∞-connective for each $Y \in \mathrm{N}(\mathbf{A}'^{\mathrm{o}}_X)$. For this, it suffices to show that $x^*\alpha(Y)$ is an equivalence for every point $x \in X$ (Lemma A.3.9). Using Proposition A.9.16, we can reduce to the case $X = \{x\}$ where the result is obvious. Applying the functor of global sections to α, we deduce that for every Kan fibration $Y \to \mathrm{Sing}(X)$ the restriction map

$$\mathrm{Fun}_{\mathrm{Sing}(X)}(\mathrm{Sing}(X), Y) \to \mathrm{Fun}_{\mathrm{Sing}(X)}(\mathrm{Sing}^A(X), Y)$$

小红书
小红书号:3189205503 qq

is a homotopy equivalence of Kan complexes, which is equivalent to the assertion that i is a weak homotopy equivalence. □

We now turn to the proof of Theorem A.9.3 itself. Our first objective is to show that the functor Ψ_X takes values in the the full subcategory $\mathcal{S}\mathrm{hv}(X) \subseteq \mathcal{P}(\mathcal{B}(X))$.

Lemma A.9.5. Let A be a partially ordered set, let X be a paracompact topological space equipped with a conical A-stratification. The functor $\Psi_X : \mathrm{N}(\mathbf{A}^{\mathrm{o}}_X) \to \mathcal{P}(\mathcal{B}(X))$ factors through the full subcategory $\mathcal{S}\mathrm{hv}(X) \subseteq \mathcal{P}(\mathcal{B}(X))$.

Proof. Let $U \in \mathcal{B}(X)$, and let $S \subseteq \mathcal{B}(U)$ be a covering sieve on U. In view of Theorem HTT.4.2.4.1 , it will suffice to show that for every left fibration $Y \to \mathrm{Sing}^A(X)$, the canonical map

$$\mathrm{Fun}_{\mathrm{Sing}^A(X)}(\mathrm{Sing}^A(U), Y) \to \varprojlim_{V \in S} \mathrm{Fun}_{\mathrm{Sing}^A(X)}(\mathrm{Sing}^A(V), Y)$$

exhibits the Kan complexes $\mathrm{Fun}_{\mathrm{Sing}^A(X)}(\mathrm{Sing}^A(U), Y)$ as a homotopy limit of the diagram of Kan complexes $\{\mathrm{Fun}_{\mathrm{Sing}^A(X)}(\mathrm{Sing}^A(V), Y)\}_{V \in S}$. For this, it suffices to show that $\mathrm{Sing}^A(U)$ is a homotopy colimit of the simplicial sets $\{\mathrm{Sing}^A(V)\}_{V \in S}$ in the category $(\mathcal{S}\mathrm{et}_\Delta)_{/\,\mathrm{Sing}^A(X)}$, endowed with the covariant model structure. This follows from the observation that the covariant model structure on $(\mathcal{S}\mathrm{et}_\Delta)_{/\,\mathrm{Sing}^A(X)}$ is a localization of the Joyal model structure, and $\mathrm{Sing}^A(U)$ is a homotopy colimit of $\{\mathrm{Sing}^A(V)\}_{V \in S}$ with respect to the Joyal model structure (by Theorems A.7.1 and HTT.4.2.4.1). □

Remark A.9.6. Let X be a paracompact space equipped with an A-stratification. For each open F_σ subset U of X, the composition of $\Psi_X : \mathrm{N}(\mathbf{A}^{\mathrm{o}}) \to \mathcal{S}\mathrm{hv}(X)$ with the evaluation functor $\mathcal{F} \mapsto \mathcal{F}(U)$ from $\mathcal{S}\mathrm{hv}(X)$ to $\mathcal{S}$ is equivalent to the functor $\mathrm{N}(\mathbf{A}^{\mathrm{o}}_X) \to \mathcal{S}$ corepresented by (a fibrant replacement for) the object $\mathrm{Sing}^A(U) \in \mathbf{A}_X$. It follows that Ψ_X preserves small limits.

Remark A.9.7. Combining Remark A.9.6 with Proposition HTT.5.5.6.16 , we deduce that the functor

$$\Psi_X : \mathrm{Fun}(\mathrm{Sing}^A(X), \mathcal{S}) \simeq \mathrm{N}(\mathbf{A}^{\mathrm{o}}_X) \to \mathcal{S}\mathrm{hv}(X)$$

preserves n-truncated objects for each $n \geq -1$. Since every object $F \in \mathrm{Fun}(\mathrm{Sing}^A(X), \mathcal{S})$ equivalent to a limit of truncated objects (since Postnikov towers in $\mathcal{S}$ are convergent), we deduce from Remark A.9.6 that $\Psi_X(F)$ is also equivalent to a limit of truncated objects, and therefore hypercomplete.

We now discuss the functorial behavior of the map Ψ_X. Let $f : X' \to X$ be a continuous map of paracompact spaces. Let A be a partially ordered set such that X is endowed with an A-stratification. Then X' inherits an A-stratification. The map f determines a morphism of simplicial sets $\mathrm{Sing}^A(X') \to \mathrm{Sing}^A(X)$; let $r : \mathbf{A}_X \to \mathbf{A}_{X'}$ be the associated pullback functor and $R : \mathrm{N}(\mathbf{A}^{\mathrm{o}}_X) \to \mathrm{N}(\mathbf{A}'^{\mathrm{o}}_X)$ the induced map of ∞-categories. For each $U \in \mathcal{B}(X)$, we have $f^{-1}U \in \mathcal{B}(X')$. The canonical map $\mathrm{Sing}^A(f^{-1}U) \to \mathrm{Sing}^A(U)$ induces a map $\theta_X(U, Y) \to \theta_{X'}(f^{-1}U, r(Y))$.

小红书
小红书号:3189205503 qq

These maps together determine a natural transformation of functors $\Psi_X \to f_* \Psi_{X'} R$ from $\mathrm{N}(\mathbf{A}^{\mathrm{o}}_X)$ to $\mathcal{S}\mathrm{hv}(X)$. We let $\phi_{X',X} : f^* \Psi_X \to \Psi_{X'} R$ denote the adjoint transformation (which is well-defined up to homotopy).

Example A.9.8. If X' is an open F_σ subset of X, then the pullback functor $f^* : \mathcal{S}\mathrm{hv}(X) \to \mathcal{S}\mathrm{hv}(X')$ can be described as the restriction along the inclusion of partially ordered sets $\mathcal{B}(X') \subseteq \mathcal{B}(X)$. In this case, the natural transformation $\phi_{X',X}$ can be chosen to be an isomorphism of simplicial sets, since the maps $\theta_X(U, Y) \to \theta_{X'}(U, r(Y))$ are isomorphisms for $U \subseteq X'$.

Lemma A.9.9. Let X be a paracompact topological space equipped with an A-stratification. Let $a \in A$, let $X' = X_a$, and let $f : X' \to X$ denote the inclusion map. Assume that X_a is paracompact. Then the natural transformation $\phi_{X',X}$ defined above is an equivalence.

Proof. Fix a left fibration $M \to \mathrm{Sing}^A(X)$, and let $M' = M \times_{\mathrm{Sing}^A(X)} \mathrm{Sing}(X_a)$. We wish to show that $\phi_{X',X}$ induces an equivalence of sheaves $f^* \Psi_X(M) \to \Psi_{X_a}(M')$. This assertion is local on X_a. We may therefore use Lemma A.5.16 (and Example A.9.8) to reduce to the case where X has the form $Z \times C(Y)$, where Y is an $A_{>a}$-stratified space. Corollary HTT.7.1.5.6 implies that the left hand side can be identified with the (filtered) colimit $\varinjlim_V (\Psi_X(Y))(V)$, where V ranges over the collection of all open neighborhoods of Z in $Z \times C(Y)$. In view of Lemma A.5.12, it suffices to take the same limit indexed by those open neighborhoods of the form V_g, where $g : Z \to (0, \infty)$ is a continuous function. It will therefore suffice to show that each of the maps $\Psi_X(Y)(V_g) \to \Psi_{X_a}(Y')(Z)$ is a homotopy equivalence. This map is given by the restriction

$$\mathrm{Fun}_{\mathrm{Sing}^A(X)}(\mathrm{Sing}^A(V_g), Y) \to \mathrm{Fun}_{\mathrm{Sing}^A(X)}(\mathrm{Sing}(Z), Y).$$

To show that this map is a homotopy equivalence, it suffices to show that the inclusion $i : \mathrm{Sing}(Z) \hookrightarrow \mathrm{Sing}^A(V_g)$ is a covariant equivalence in $\mathrm{Sing}^A(X)$. We will show that i is left anodyne. Let $h : C(Y) \times [0, 1] \to C(Y)$ be the map which carries points $(y, s, t) \in Y \times (0, \infty) \times (0, 1]$ to $(y, st) \in Y \times (0, \infty)$, and every other point to the cone point of $C(Y)$. Then h induces a homotopy $H : V_g \times [0, 1] \to V_g$ from the projection $V_g \to Z \subseteq V_g$ to the identity map on V_g. The homotopy H determines a natural transformation from the projection $\mathrm{Sing}^A(V_g) \to \mathrm{Sing}(Z)$ to the identity map from $\mathrm{Sing}^A(V_g)$ to itself, which exhibits the map i as a retract of the left anodyne inclusion

$$(\mathrm{Sing}(Z) \times \Delta^1) \coprod_{\mathrm{Sing}(Z) \times \{0\}} (\mathrm{Sing}^A(V_g) \times \{0\}) \subseteq \mathrm{Sing}^A(V_g) \times \Delta^1.$$

□

Lemma A.9.10. Let X be a paracompact topological space which is locally of singular shape and is equipped with a conical A-stratification. Then the functor $\Psi_X : \mathrm{N}(\mathbf{A}^{\mathrm{o}}_X) \to \mathcal{S}\mathrm{hv}(X)$ factors through the full subcategory $\mathcal{S}\mathrm{hv}^A(X) \subseteq \mathcal{S}\mathrm{hv}(X)$ spanned by the A-constructible sheaves on X.

小红书
小红书号:3189205503 qq

Proof. Choose a left fibration $Y \to \mathrm{Sing}^A(X)$ and an element $a \in A$; we wish to prove that $(\Psi_X(Y)|X_a) \in \mathcal{S}\mathrm{hv}(X_a)$ is locally constant. The assertion is local on X, so we may assume without loss of generality that X has the form $Z \times C(Y)$ (Lemma A.5.16), so that $X_a \simeq Z$ is locally of singular shape (Remark A.5.18). Using Lemma A.9.9, we can replace X by Z, and thereby reduce to the case where X consists of only one stratum. In this case, the desired result follows from Theorem A.4.19. □

Lemma A.9.11. Let X be a paracompact topological space of the form $Z \times C(Y)$, and let $\pi : X \to Z$ denote the projection map. Then the pullback functor $\pi^* : \mathcal{S}\mathrm{hv}(Z) \to \mathcal{S}\mathrm{hv}(X)$ is fully faithful.

Proof. Fix an object $\mathcal{F} \in \mathcal{S}\mathrm{hv}(Z)$; we will show that the unit map $\mathcal{F} \to \pi_* \pi^* \mathcal{F}$ is an equivalence. In view of Corollary HTT.7.1.4.4 , we may suppose that there exists a map of topological spaces $Z' \to Z$ such that $\mathcal{F}$ is given by the formula $U \mapsto \mathrm{Map}_{\mathcal{T}\mathrm{op}_{/Z}}(U, Z')$. Using the results of §HTT.7.1.5 , we may suppose also that $\pi^* \mathcal{F}$ is given by the formula $V \mapsto \mathrm{Map}_{\mathcal{T}\mathrm{op}_{/X}}(V, Z' \times_Z X)$. It will suffice to show that the induced map $\mathcal{F}(U) \to (\pi^* \mathcal{F})(\pi^{-1} U)$ is a homotopy equivalence for each $U \in \mathcal{B}(Z)$. Replacing Z by U, we may assume that $U = Z$. In other words, we are reduced to proving that the map

$$\mathrm{Map}_{\mathcal{T}\mathrm{op}_{/Z}}(Z, Z') \to \mathrm{Map}_{\mathcal{T}\mathrm{op}_{/Z}}(X, Z')$$

is a homotopy equivalence of Kan complexes. This follows from the observation that there is a deformation retraction from X onto Z (in the category $\mathcal{T}\mathrm{op}_{/Z}$ of topological spaces over Z). □

Lemma A.9.12. Let X be a paracompact space of the form $Z \times C(Y)$, let $\pi : X \to Z$ denote the projection map, and let $i : Z \to X$ be the inclusion. Let $\mathcal{F} \in \mathcal{S}\mathrm{hv}(X)$ be a sheaf whose restriction to $Z \times Y \times (0, \infty)$ is foliated. Then the canonical map $\pi_* \mathcal{F} \to i^* \mathcal{F}$ is an equivalence.

Proof. It will suffice to show that for every $U \in \mathcal{B}(Z)$, the induced map $\mathcal{F}(\pi^{-1}(U)) \to (i^* \mathcal{F})(U)$ is a homotopy equivalence. Replacing Z by U, we can assume $U = Z$. Using Corollary HTT.7.1.5.6 , we can identify $(i^* \mathcal{F})(Z)$ with the filtered colimit $\varinjlim_V \mathcal{F}(V)$, where V ranges over all open neighborhoods of Z in X. In view of Lemma A.5.12, it suffices to take the colimit over the cofinal collection of open sets of the form V_f, where $f : Z \to (0, \infty)$ is a continuous map. To prove this, it suffices to show that each of the restriction maps $\theta : \mathcal{F}(X) \to \mathcal{F}(V_f)$ is an equivalence. Let $W \subseteq Z \times Y \times (0, \infty)$ be the set of triples (z, y, t) such that $t > \frac{f(z)}{2}$, so that we have a pullback diagram

$$\begin{array}{ccc} \mathcal{F}(X) & \xrightarrow{\theta} & \mathcal{F}(V_f) \\ \downarrow & & \downarrow \\ \mathcal{F}(W) & \xrightarrow{\theta'} & \mathcal{F}(W \cap V_f). \end{array}$$

小红书 小红书号:3189205503 qq

To prove that θ is a homotopy equivalence, it suffices to show that θ' is a homotopy equivalence. The map θ' fits into a commutative diagram

$$\begin{array}{ccc} \mathcal{F}(W) & \xrightarrow{\theta'} & \mathcal{F}(W \cap V_f) \\ & \searrow \quad \swarrow & \\ & (s^* \mathcal{F})(Z \times Y), & \end{array}$$

where $s : Z \times Y \to W \cap V_f$ is the section given by the continuous map $\frac{3}{4} f : Z \to (0, \infty)$. Since $\mathcal{F}$ is foliated, Proposition A.2.5 and Lemma A.2.9 guarantee that the vertical maps in this diagram are both equivalences, so that θ' is an equivalence as well. □

Lemma A.9.13. Let A be a partially ordered set containing an element a. Let X be a paracompact $A_{\geq a}$-stratified topological space of the form $Z \times C(Y)$, where Y is an $A_{>a}$-stratified space. Let $\mathcal{C} = \mathcal{S}\mathrm{hv}^A(X)$. Let $j : Z \times Y \times (0, \infty) \to X$ denote the inclusion and let $\mathcal{C}_0$ denote the intersection of $\mathcal{C}$ with the essential image of the left adjoint $j_! : \mathcal{S}\mathrm{hv}(Z \times Y \times (0, \infty)) \to \mathcal{S}\mathrm{hv}(X)$ to the pullback functor j^*. Let $\pi : X \to Z$ be the projection map, and let $\mathcal{C}_1$ denote the intersection of $\mathcal{C}$ with the essential image of π^* (which is fully faithful by Lemma A.9.11). Then:

(1) The inclusion functors $\mathcal{C}_0 \subseteq \mathcal{C}$ and $\mathcal{C}_1 \subseteq \mathcal{C}$ admit right adjoints L_0 and L_1.

(2) The functor L_0 is complementary to L_1.

Proof. Let $i : Z \to X$ be the inclusion map. The functor L_0 is given by the composition $j_! j^*$, and the functor L_1 is given by the composition $\pi^* \pi_*$ (which is equivalent to $\pi^* i^*$ by Lemma A.9.12, and therefore preserves constructibility and pushout diagrams). Since the composition $i^* j_!$ is equivalent to the constant functor $\mathcal{S}\mathrm{hv}(Z \times Y \times (0, \infty)) \to \mathcal{S}\mathrm{hv}(Z)$ (taking value equal to the initial object of $\mathcal{S}\mathrm{hv}(Z)$), the functor L_1 carries every morphism in $\mathcal{C}_0$ to an equivalence. Finally, suppose that α is a morphism in $\mathcal{C}$ such that $L_0(\alpha)$ and $L_1(\alpha)$ are equivalences. Since $j_!$ and π^* are fully faithful, we conclude that $j^*(\alpha)$ and $i^*(\alpha)$ are equivalences, so that α is an equivalence (Corollary A.5.11). □

Lemma A.9.14. Let X be a paracompact topological space which is locally of singular shape and is equipped with a conical A-stratification. Then the full subcategory $\mathcal{S}\mathrm{hv}^A(X) \subseteq \mathcal{S}\mathrm{hv}(X)$ is stable under finite colimits in $\mathcal{S}\mathrm{hv}(X)$.

Proof. Let $\mathcal{F} \in \mathcal{S}\mathrm{hv}(X)$ be a finite colimit of A-constructible sheaves; we wish to show that $\mathcal{F}|X_a$ is constructible for each $a \in A$. The assertion is local; we may therefore assume that X has the form $Z \times C(Y)$ (Lemma A.5.16). Then $X_a \simeq Z$ is paracompact and locally of singular shape (Remark A.5.18) so the desired result follows from Corollary A.1.16. □

Lemma A.9.15. Let X be a paracompact topological space which is locally of singular shape and equipped with a conical A-stratification, where A satisfies the ascending chain condition. Then the functor $\Psi_X : \mathrm{N}(\mathbf{A}^{\circ}_X) \to \mathcal{S}\mathrm{hv}(X)$ preserves finite colimits.

小红书
小红书号:3189205503 qq

Proof. Fix a diagram $p : K \to \mathrm{N}(\mathbf{A}^{\mathrm{o}}_X)$ having a colimit Y, where K is finite. We wish to prove that the induced map $\alpha : \varinjlim(\Psi_X \circ p) \to \Psi_X(Y)$ is an equivalence. Lemma A.9.10 implies that $\Psi_X(Y) \in \mathcal{S}\mathrm{hv}^A(X)$, and is therefore hypercomplete (Proposition A.5.9). Similarly, $\varinjlim(\Psi_X \circ p)$ is a finite colimit in $\mathcal{S}\mathrm{hv}(X)$ of A-constructible sheaves, hence A-constructible (Lemma A.9.14) and therefore hypercomplete. Consequently, to prove that α is an equivalence, it will suffice to show that α is ∞-connective. This condition can be tested pointwise (Lemma A.3.9); we may therefore reduce to the problem of showing that α is an equivalence when restricted to each stratum X_a. Shrinking X if necessary, we may suppose that X has the form $Z \times C(Y)$ (Lemma A.5.16) so that $X_a \simeq Z$ is paracompact and locally of singular shape (Remark A.5.18). Using Lemma A.9.9 we can replace X by X_a and thereby reduce to the case of a trivial stratification. In this case, the functor Ψ_X is a fully faithful embedding (Theorem A.4.19) those essential image is stable under finite colimits (Corollary A.1.16), and therefore preserves finite colimits. □

We can use the same argument to prove a sharpened version of Lemma A.9.9 (at least in case where A satisfies the ascending chain condition):

Proposition A.9.16. Let A be a partially ordered set which satisfies the ascending chain condition, and let $f : X' \to X$ be a continuous map between paracompact topological spaces which are locally of singular shape. Suppose that X is endowed with a conical A-stratification, and that the induced A-stratification of X' is also conical. Then the natural transformation $\phi_{X',X}$ is an equivalence of functors from $\mathrm{N}(\mathbf{A}^{\mathrm{o}}_X)$ to $\mathcal{S}\mathrm{hv}(X')$.

Lemma A.9.17. Let X be a topological space of singular shape. For every point $x \in X$, there exists an open neighborhood U of x such that the inclusion of Kan complexes $\mathrm{Sing}(U) \to \mathrm{Sing}(X)$ is nullhomotopic.

Proof. Let $K = \mathrm{Sing}(X) \in \mathcal{S}$, and let $\pi : X \to *$ denote the projection map. Since X is of singular shape, there exists a morphism $\mathbf{1} \to \pi^* K$ in $\mathcal{S}\mathrm{hv}(X)$ The geometric realization $|\mathrm{Sing}(X)|$ is a CW complex. Since X is of singular shape, composition with the counit map $v : |\mathrm{Sing}(X)| \to X$ induces a homotopy equivalence of Kan complexes $\mathrm{Map}_{\mathcal{T}\mathrm{op}}(X, |\mathrm{Sing}(X)|) \to \mathrm{Map}_{\mathcal{T}\mathrm{op}}(|\mathrm{Sing}(X)|, |\mathrm{Sing}(X)|)$. In particular, there exists a continuous map $s : X \to |\mathrm{Sing}(X)|$ such that $s \circ v$ is homotopic to the identity. Choose a contractible open subset $V \subseteq |\mathrm{Sing}(X)|$ containing $s(x)$, and let $U = s^{-1}(V)$. We claim that the inclusion $i : \mathrm{Sing}(U) \to \mathrm{Sing}(X)$ is nullhomotopic. To prove this, it suffices to show that $|i| : |\mathrm{Sing}(U)| \to |\mathrm{Sing}(X)|$ is nullhomotopic. This map is homotopic to the composition $s \circ v \circ |i|$, which factors through the contractible open subset $V \subseteq |\mathrm{Sing}(X)|$. □

Lemma A.9.18. Let $p : \mathcal{M} \to \Delta^1$ be a correspondence between ∞-categories. Assume that there exists a retraction r from $\mathcal{M}$ onto the full subcategory $\mathcal{M}_1$. Let $\mathcal{A}$ be an ∞-category which admits finite limits, and let $\mathcal{C} = \mathrm{Fun}(\mathcal{M}, \mathcal{A})$. We define full subcategories $\mathcal{C}_0, \mathcal{C}_1 \subseteq \mathcal{C}$ as follows:

(*a*) A functor $f : \mathcal{M} \to \mathcal{A}$ belongs to $\mathcal{C}_0$ if f is a right Kan extension of $f|\mathcal{M}_0$ (that is, if $f(M)$ is a final object of $\mathcal{A}$, for each $M \in \mathcal{M}_1$).

小红书
小红书号:3189205503 qq

(*b*) A functor $f : \mathcal{M} \to \mathcal{A}$ belongs to $\mathcal{C}_1$ if $f(\alpha)$ is an equivalence, for every p-Cartesian morphism in $\mathcal{M}$.

Then $\mathcal{C}$ is a recollement of $\mathcal{C}_0$ and $\mathcal{C}_1$ (see Definition A.8.1).

Proof. We verify that $\mathcal{C}_0$ and $\mathcal{C}_1$ satisfy the requirements of Definition A.8.1. Condition (a) is obvious. We next prove that the inclusions $\mathcal{C}_0 \subseteq \mathcal{C}$, $\mathcal{C}_1 \subseteq \mathcal{C}$ admit left adjoints, by explicit construction. The functor L_0 is given by composing the restriction functor $\mathrm{Fun}(\mathcal{M}, \mathcal{A}) \to \mathrm{Fun}(\mathcal{M}_0, \mathcal{A})$ with a section of the trivial Kan fibration $\mathcal{C}_0 \to \mathrm{Fun}(\mathcal{M}_0, \mathcal{A})$. The functor L_1 is given by composing the restriction functor $\mathrm{Fun}(\mathcal{M}, \mathcal{A}) \to \mathrm{Fun}(\mathcal{M}_1, \mathcal{A})$ with the retraction $r : \mathcal{M} \to \mathcal{M}_1$. This verifies condition (b) of Definition A.8.1. It is clear that the ∞-category $\mathcal{C}$ admits finite limits (which are computed pointwise), and the explicit construction given above shows that L_0 and L_1 are left exact, so that (c) is satisfied.

The restriction $L_1 | \, \mathcal{C}_0$ factors through $\mathrm{Fun}(\mathcal{M}_1, \mathcal{A}')$, where $\mathcal{A}' \subseteq \mathcal{A}$ is the contractible Kan complex spanned by the final objects of $\mathcal{A}$, which implies (d). To prove (e), we note that if α is a morphism in $\mathcal{C}$ such that $L_0(\alpha)$ and $L_1(\alpha)$ are both equivalences, then α is a natural transformation of functors from $\mathcal{M}$ to $\mathcal{A}$ which induces an equivalence after evaluation at every object $\mathcal{M}_1$ and every object of $\mathcal{M}_0$. Since every object of $\mathcal{M}$ belongs to $\mathcal{M}_0$ or $\mathcal{M}_1$, we conclude that α is an equivalence. □

Proof of Proposition A.9.16. Let $Y \in \mathrm{N}(\mathbf{A}^{\mathrm{o}}_X)$, and let $Y' = Y \times_{\mathrm{Sing}^A(X)} \mathrm{Sing}^A(X')$. We wish to prove that the map $\alpha : f^* \Psi_X(Y) \to \Psi_{X'}(Y')$ is an equivalence in $\mathcal{S}\mathrm{hv}(X')$. Lemma A.9.10 implies that $\Psi_X(Y) \in \mathcal{S}\mathrm{hv}^A(X)$, so that $f^* \Psi_X(Y) \in \mathcal{S}\mathrm{hv}^A(X')$. Similarly, $\Psi_{X'}(Y') \in \mathcal{S}\mathrm{hv}^A(X')$, so that both $f^* \Psi_X(Y)$ and $\Psi_{X'}(Y')$ are hypercomplete (Proposition A.5.9). To prove that α is an equivalence, it will suffice to show that α is ∞-connective. Since this condition can be tested pointwise, it will suffice to show that α induces an equivalence after restricting to each stratum X'_a of X'. Using Lemma A.5.16 and Remark A.5.18, we can shrink X and X' so that X_a and X'_a are again paracompact and locally of singular shape. Applying Lemma A.9.9, we can reduce to the case where $X = X_a$ and $X' = X'_a$. Shrinking X further (using Lemma A.9.17), we may assume that $Y \simeq \mathrm{Sing}(X) \times K$ for some Kan complex $K \in \mathcal{S}$. In this case, Example A.4.18 allows us to identify $\Psi_X(Y)$ with the pullback $\pi^* K$ and $\Psi_{X'}(Y')$ with $\pi'^* K$, where $\pi : X \to *$ and $\pi' : X' \to *$ denote the projection maps. Under these identifications, the natural transformation $\phi_{X',X}(Y)$ is induced by the canonical equivalence $f^* \circ \pi^* \simeq (\pi \circ f)^* = \pi'^*$. □

Proof of Theorem A.9.3. We will prove more generally that for every $U \in \mathcal{B}(X)$, the functor $\Psi_U : \mathrm{N}(\mathbf{A}^{\mathrm{o}}_U) \to \mathcal{S}\mathrm{hv}^A(U)$ is an equivalence of ∞-categories. The proof proceeds by induction on $\mathrm{rk}(U)$, where the rank functor rk is defined in Remark A.5.17.

Let S denote the partially ordered set of all open sets $V \in \mathcal{B}(U)$ which are homeomorphic to a product $Z \times C(Y)$, where Y is an $A_{>a}$-stratified space, and $Z \times C(Y)$ is endowed with the induced $A_{\geq a}$-stratification. For every such open set V, let $\chi_V \in \mathcal{S}\mathrm{hv}(X)$ be the sheaf determined by the

小红书
小红书号:3189205503 qq

formula

$$\chi_V(W) = \begin{cases} * & \text{if } W \subseteq V \\ \emptyset & \text{otherwise.} \end{cases}$$

Let α denote the canonical map $\varinjlim_V \chi_V \to \chi_U$. For each point $x \in U$, the stalk of the colimit $\varinjlim_V \chi_V$ at x is homotopy equivalent to the nerve of the partially ordered set $S_x = \{V \in S : x \in V\}$. It follows from Lemma A.5.16 that the partially ordered set S_x^{op} is filtered, so that $|S_x|$ is contractible: consequently, the map α is ∞-connective. Consequently, α induces an equivalence $\varinjlim_V \chi_V \to \chi_U$ in the hypercomplete ∞-topos $\mathcal{S}\mathrm{hv}(X)^{\mathrm{hyp}}$. Applying Theorem HTT.6.1.3.9 to the ∞-topos $\mathcal{S}\mathrm{hv}(X)^{\mathrm{hyp}}$, we conclude that $\mathcal{S}\mathrm{hv}(U)^{\mathrm{hyp}} \simeq \mathcal{S}\mathrm{hv}(X)^{\mathrm{hyp}}_{/\chi_U}$ is equivalent to the homotopy limit of the diagram of ∞-categories $\{\mathcal{S}\mathrm{hv}(V)^{\mathrm{hyp}} \simeq \mathcal{S}\mathrm{hv}(X)^{\mathrm{hyp}}_{/\chi_V}\}_{V \in S}$. Proposition A.5.9 guarantees that $\mathcal{S}\mathrm{hv}^A(U) \subseteq \mathcal{S}\mathrm{hv}(U)^{\mathrm{hyp}}$ (and similarly $\mathcal{S}\mathrm{hv}^A(V) \subseteq \mathcal{S}\mathrm{hv}(V)^{\mathrm{hyp}}$) for each $V \in S$). Since the property of being constructible can be tested locally, we obtain an equivalence

$$\mathcal{S}\mathrm{hv}^A(U) \simeq \varprojlim \{\mathcal{S}\mathrm{hv}^A(V)\}_{V \in S}.$$

We next show that the restriction maps $\mathrm{N}(\mathbf{A}^{\mathrm{o}}_U) \to \mathrm{N}(\mathbf{A}^{\mathrm{o}}_V)$ exhibit $\mathrm{N}(\mathbf{A}^{\mathrm{o}}_U)$ as the homotopy limit of the diagram of ∞-categories $\{\mathrm{N}(\mathbf{A}^{\mathrm{o}}_V)\}_{V \in S}$. In view of the natural equivalences

$$\mathrm{Fun}(\mathrm{Sing}^A(V), \mathcal{S}) \leftarrow \mathrm{N}((\mathcal{S}\mathrm{et}_{\Delta}^{\mathfrak{C}[\mathrm{Sing}^A(V)]})^{\mathrm{o}}) \to \mathrm{N}(\mathbf{A}^{\mathrm{o}}_V),$$

it will suffice to show that the canonical map

$$\mathrm{Fun}(\mathrm{Sing}^A(U), \mathcal{S}) \to \varprojlim \{\mathrm{Fun}(\mathrm{Sing}^A(V), \mathcal{S})\}_{V \in S}$$

is an equivalence. This follows immediately from Theorem A.7.1.

We have a commutative diagram

$$\begin{array}{ccc} \mathrm{N}(\mathbf{A}^{\mathrm{o}}_U) & \longrightarrow & \varprojlim_{V \in S} \mathrm{N}(\mathbf{A}^{\mathrm{o}}_V) \\ \downarrow & & \downarrow \\ \mathcal{S}\mathrm{hv}^A(U) & \longrightarrow & \varprojlim_{V \in S} \mathcal{S}\mathrm{hv}^A(V) \end{array}$$

where the vertical maps are equivalences. Consequently, to prove that Ψ_U is an equivalence, it will suffice to show that Ψ_V is an equivalence for each $V \in S$. Replacing U by V, we can assume that U has the form $Z \times C(Y)$. We will also assume that Z is nonempty (otherwise there is nothing to prove).

Let $U' = Z \times Y \times (0, \infty)$, which we regard as an open subset of U. Let $\mathcal{C}_0 \subseteq \mathrm{N}(\mathbf{A}^{\mathrm{o}}_U)$ be the full subcategory spanned by the left fibrations $Y \to \mathrm{Sing}^A(U)$ which factor through $\mathrm{Sing}^A(U')$, and let $\mathcal{C}_1 \subseteq \mathrm{N}(\mathbf{A}^{\mathrm{o}}_U)$ be the full subcategory spanned by the Kan fibrations $Y \to \mathrm{Sing}^A(U)$. Under the equivalence $\mathrm{N}(\mathbf{A}^{\mathrm{o}}_U) \simeq \mathrm{Fun}(\mathrm{Sing}^A(U), \mathcal{S})$, these correspond to the full subcategories described in the

小红书
小红书号:3189205503 qq

dual of Lemma A.9.18 (where $\mathcal{A} = \mathcal{S}$ and $p : \mathrm{Sing}^A(U) \to \Delta^1$ is characterized by the requirements that $p^{-1}\{0\} = \mathrm{Sing}(U_a)$ and $p^{-1}\{1\} = \mathrm{Sing}^A(U')$). It follows that the inclusions $\mathcal{C}_0, \mathcal{C}_1 \subseteq \mathrm{N}(\mathbf{A}^{\circ}_U)$ admit right adjoints L_0 and L_1, and that L_0 is complementary to L_1. Let $\mathcal{C}'_0, \mathcal{C}'_1 \subseteq \mathcal{S}\mathrm{hv}^A(U)$ be defined as in Lemma A.9.13, so that we again have right adjoints $L'_0 : \mathcal{S}\mathrm{hv}^A(U) \to \mathcal{C}'_0$ and $L'_1 : \mathcal{S}\mathrm{hv}^A(U) \to \mathcal{C}'_1$ which are complementary. We will prove that the functor Ψ_U is an equivalence of ∞-categories by verifying the hypotheses of (the dual version of) Proposition A.8.14:

(2) The functor Ψ_U restricts to an equivalence $\mathcal{C}_0 \to \mathcal{C}'_0$. Let $Y \to \mathrm{Sing}^A(U')$ be an object of $\mathcal{C}_0$. Then $(\Psi_U(Y))(W)$ is empty if W is not contained in U', so that $\Psi_U(Y) \in \mathcal{C}'_0$. Moreover, the composition of $\Psi_U | \mathcal{C}_0$ with the equivalence $\mathcal{C}'_0 \simeq \mathcal{S}\mathrm{hv}^A(U')$ coincides with the functor $\Psi_{U'}$. Since the strata U'_b are empty unless $b > a$, while U_a is nonempty (since $Z \neq \emptyset$), we have $\mathrm{rk}(U') < \mathrm{rk}(U)$ so that $\Psi_{U'}$ is an equivalence of ∞-categories by the inductive hypothesis.

(2′) We must show that the functor Ψ_U restricts to an equivalence $\mathcal{C}_1 \to \mathcal{C}'_1$. Let $\pi : U \to Z$ denote the projection. We have a diagram of ∞-categories

$$\begin{array}{ccc} \mathrm{N}(\mathbf{A}^{\circ}_Z) & \longrightarrow & \mathrm{N}(\mathbf{A}^{\circ}_U) \\ \downarrow{\scriptstyle \Psi_Z} & & \downarrow{\scriptstyle \Psi_U} \\ \mathcal{S}\mathrm{hv}(Z) & \xrightarrow{\pi^*} & \mathcal{S}\mathrm{hv}(U) \end{array}$$

which commutes up to homotopy (Proposition A.9.16). The upper horizontal arrow is fully faithful, and its essential image is precisely the ∞-category $\mathcal{C}_1$. Consequently, it suffices to show that the composite map $\pi^* \Psi_Z$ is a fully faithful embedding whose essential image is precisely $\mathcal{C}'_1$. Theorem A.4.19 implies that Ψ_Z is fully faithful, and that its essential image is the full subcategory of $\mathcal{S}\mathrm{hv}(Z)$ spanned by the locally constant sheaves. The desired result now follows from the definition of $\mathcal{C}'_1$.

(3) The functor Ψ_U preserves pushouts. This follows from Lemma A.9.15.

(4) If $\alpha : Y_0 \to Y$ is a morphism which exhibits $Y_0 \in \mathcal{C}_0$ as a $\mathcal{C}_0$-colocalization of $Y \in \mathcal{C}_1$, then $\Psi_U(\alpha)$ exhibits $\Psi_U(Y_0)$ as a $\mathcal{C}'_0$-localization of $\Psi_U(Y_1)$. Unwinding the definitions, α induces an equivalence of left fibrations $Y_0 \to Y \times_{\mathrm{Sing}^A(U)} \mathrm{Sing}^A(U')$, and we must show that for each $W \in \mathcal{B}(U')$ that the induced map $\mathrm{Fun}_{\mathrm{Sing}^A(U)}(\mathrm{Sing}^A(W), Y_0) \to \mathrm{Fun}_{\mathrm{Sing}^A(U)}(\mathrm{Sing}^A(W), Y)$ is a homotopy equivalence. This is clear, since the condition that $W \subseteq U'$ guarantees that any map $\mathrm{Sing}^A(W) \to Y$ factors uniquely through the fiber product $Y \times_{\mathrm{Sing}^A(U)} \mathrm{Sing}^A(U')$.

□

Appendix B

Categorical Patterns

Let S be a simplicial set, and let $(\mathcal{S}et^+_\Delta)_{/S}$ denote the category of marked simplicial sets $\overline{X} = (X, M)$ equipped with a map $X \to S$. According to Proposition HTT.3.1.3.7 , there is a simplicial model structure on the category $(\mathcal{S}et^+_\Delta)_{/S}$ (the *coCartesian model structure*) whose fibrant objects can be identified with coCartesian fibrations of simplicial sets $X \to S$. In practice, there are a variety of related conditions that a map $p : X \to S$ might be required to satisfy:

(a) A coCartesian fibration $p : X \to S$ is classified by a functor $\chi : S \to \mathcal{C}\mathrm{at}_\infty$. In various contexts it is natural to demand that the functor χ carry certain diagrams in S to limit diagrams in $\mathcal{C}\mathrm{at}_\infty$.

(b) If $p : X \to S$ is a locally coCartesian fibration, then every edge $\phi : s \to s'$ in S determines a functor $\phi_! : X_s \to X_{s'}$. If we are given a 2-simplex σ :

then we obtain a natural transformation $u_\sigma : \theta_! \to \psi_! \circ \phi_!$. Moreover, p is a coCartesian fibration if and only if each of these natural transformations is an equivalence (Remark HTT.2.4.2.9). In general, we might demand that u_σ be an equivalence only for some specified collection of 2-simplices σ of S.

(c) Let $p : X \to S$ be an inner fibration of simplicial sets. Then p is a locally coCartesian fibration if and only if, for every edge $e : s \to s'$ and every vertex $x \in X_s$, there exists a locally coCartesian edge $\overline{e} : x \to x'$ with $p(\overline{e}) = e$. In general, we might demand that $\overline{e}$ exists only for a specific class of edges e of S.

In specific situations, we might be interested in studying maps $p : X \to S$ which satisfy some combination of the conditions suggested in (a), (b) and (c). For example, the notion of ∞-operad

小红书
小红书号:3189205503 qq

introduced in Chapter 2 can be described in this way (see Definition 2.1.1.10). Our goal in this appendix is to develop a variant of the coCartesian model structure on $(\mathcal{S}et^{+}_{\Delta})_{/S}$, which is adapted to these types of applications. We begin by introducing some terminology.

Definition B.0.19. Let S be a simplicial set. A *categorical pattern* on S is a triple $(M_S, T, \{p_\alpha : K_\alpha^{\triangleleft} \to S'\}_{\alpha \in A})$, where M_S is a collection of edges of S which contains all degenerate edges, T is a collection of 2-simplices of S which contains all degenerate 2-simplices, and $\{p_\alpha : K_\alpha^{\triangleleft} \to S\}_{\alpha \in A}$ is a collection of maps of simplicial sets which carry each edge of $K_\alpha^{\triangleleft}$ into M_S and each 2-simplex of $K_\alpha^{\triangleleft}$ into T.

Suppose we are given a categorical pattern $\mathfrak{P} = (M_S, T, \{p_\alpha : K_\alpha^{\triangleleft} \to S\}_{\alpha \in A})$ on S. A *marked simplicial set* over $\mathfrak{P}$ is a marked simplicial set $\overline{X} = (X, M)$ equipped with a map $f : X \to S$ satisfying the following condition: for every edge e of X which belongs to M, $f(e)$ belongs to M_S. We let $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$ denote the category of marked simplicial sets over $\mathfrak{P}$.

We will say that an object $\overline{X} \in (\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$ is $\mathfrak{P}$-*fibered* if the following conditions are satisfied:

(1) The underlying map of simplicial sets $f : X \to S$ is an inner fibration.

(2) For each edge $\Delta^1 \to S$ belonging to M_S, the induced map $f' : X \times_S \Delta^1 \to \Delta^1$ is a coCartesian fibration.

(3) An edge e of X belongs to M if and only if $f(e)$ belongs to M_S and e is an f'-coCartesian edge of $X \times_S \Delta^1$.

(4) Given a commutative diagram

$$\begin{array}{ccc} \Delta^{\{0,1\}} & \xrightarrow{e} & X \\ \downarrow & & \downarrow \\ \Delta^2 & \xrightarrow{\sigma} & S, \end{array}$$

if $e \in M$ and $\sigma \in T$, then e determines an f'-coCartesian edge of $X \times_S \Delta^2$, where $f' : X \times_S \Delta^2 \to \Delta^2$ denotes the projection map.

(5) For every index $\alpha \in A$, the induced coCartesian fibration $f_\alpha : X \times_S K_\alpha^{\triangleleft} \to K_\alpha^{\triangleleft}$ is classified by a limit diagram $K_\alpha^{\triangleleft} \to \mathcal{C}\mathrm{at}_\infty$.

(6) For every index $\alpha \in A$ and every coCartesian section s of the map f_α, s is an f-limit diagram in X.

We can now state the main result of this appendix:

Theorem B.0.20. Let $\mathfrak{P}$ be a categorical pattern on a simplicial set S. Then there exists a left proper combinatorial simplicial model structure on $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$, which is uniquely characterized by the following properties:

小红书
小红书号:3189205503 qq

(*C*) A morphism $f : \overline{X} \to \overline{Y}$ in $(\mathcal{S}et^+_\Delta)_{/\mathfrak{P}}$ is a cofibration if and only if f induces a monomorphism between the underlying simplicial sets.

(*F*) An object $\overline{X} \in (\mathcal{S}et^+_\Delta)_{/\mathfrak{P}}$ is fibrant if and only if $\overline{X}$ is $\mathfrak{P}$-fibered.

Example B.0.21. Let S be a simplicial set. The *canonical categorical pattern* on S is the categorical pattern $\mathfrak{P} = (M_S, T, \emptyset)$, where M_S consists of all edges of S and T consists of all 2-simplices of S. Then $(\mathcal{S}et^+_\Delta)_{/\mathfrak{P}}$ admits a unique model structure satisfying the conditions of Theorem B.0.20: the *coCartesian model structure* described in §HTT.3.1.3 .

We will give the proof of Theorem B.0.20 in §B.2. Our proof will rely on the construction of a large class of trivial cofibrations in $(\mathcal{S}et^+_\Delta)_{/\mathfrak{P}}$, which we carry out in §B.1. In §B.4, we will prove that the model structure on $(\mathcal{S}et^+_\Delta)_{/\mathfrak{P}}$ is functorial with respect to the categorical pattern in $\mathfrak{P}$ in a very robust way (Theorem B.4.2). The exact formulation of this functoriality result depends on the notion of a *flat inner fibration* between simplicial sets, which we explain in §B.3.

Warning B.0.22. Our notion of *categorical pattern* is of a somewhat ad-hoc nature. More general results along the lines of Theorem B.0.20 are possible, and there are less general results that would suffice for the applications in this book. Moreover, the proofs of the results presented here are somewhat dry and technical. We recommend that most of this appendix be treated as a "black box" by most readers of this book. The exception is §B.3, which can be read independently of the other sections: the notion of flat inner fibration is of some independent interest, and plays an important role in the main part of the book.

We close this introduction with a few simple observations about Definition B.0.19 and Theorem B.0.20.

Remark B.0.23. Let $\mathfrak{P}$ be a categorical pattern on a simplicial set S. We will sometimes abuse terminology by saying that a map of simplicial sets $X \to S$ is $\mathfrak{P}$-*fibered* if there exists a collection of edges M in X such that $\overline{X} = (X, M)$ is a $\mathfrak{P}$-fibered object of $(\mathcal{S}et^+_\Delta)_{/\mathfrak{P}}$. In this case, the set M is uniquely determined (requirement (3) of Definition B.0.19).

Remark B.0.24. In the situation of Definition B.0.19, conditions (5) and (6) are automatic whenever the simplicial set K_α is weakly contractible and the diagram p_α is constant.

Remark B.0.25. Let $\mathfrak{P}$ be a categorical pattern on a simplicial set S. For every pair of objects $\overline{X}, \overline{Y} \in (\mathcal{S}et^+_\Delta)_{/\mathfrak{P}}$, there exists a simplicial set $\mathrm{Map}^\sharp_S(\overline{X}, \overline{Y})$ with the following universal property: for every simplicial set K, we have a canonical bijection

$$\mathrm{Hom}_{\mathcal{S}\mathrm{et}_\Delta}(K, \mathrm{Map}^\sharp_S(\overline{X}, \overline{Y})) \simeq \mathrm{Hom}_{(\mathcal{S}et^+_\Delta)_{/\mathfrak{P}}}(K^\sharp \times \overline{X}, \overline{Y}).$$

This definition of mapping spaces endows $(\mathcal{S}et^+_\Delta)_{/\mathfrak{P}}$ with the structure of a simplicial category.

小红书
小红书号:3189205503 qq

Remark B.0.26. Let $\mathfrak{P} = (M_S, T, \{p_\alpha : K_\alpha^\triangleleft \to S'\}_{\alpha \in A})$ be a categorical pattern on a simplicial set S and let $\overline{X} = (X, M)$ be an object of $\mathcal{S}\mathrm{et}_\Delta^+$ satisfying conditions (1) through (4) of Definition B.0.19. For each index $\alpha \in A$, let $X_\alpha = X \times_S K_\alpha^\triangleleft$. Then the projection map $q : X_\alpha \to K_\alpha^\triangleleft$ is a coCartesian fibration, classified by a functor $\chi : K_\alpha^\triangleleft \to \mathcal{C}\mathrm{at}_\infty$. According to Proposition HTT.3.3.3.1 , the map χ is a limit diagram if and only if the restriction functor $r : Z \to Z_0$ is an equivalence of ∞-categories, where Z denotes the ∞-category of coCartesian sections of q and Z_0 the ∞-category of coCartesian sections of the restriction $X \times_S K_\alpha \to K_\alpha$.

Now suppose that $\overline{X}$ also satisfies condition (6) of Definition B.0.19. In this case, every coCartesian section s of q is a q-limit diagram, so that the map $\mathrm{Map}_Z(s', s) \to \mathrm{Map}_{Z_0}(s'|K, s|K)$ is a homotopy equivalence for any $s' \in Z$ (in fact, the analogous statement is true for *any* section of q). It follows that the functor r is automatically fully faithful. Now r is an equivalence of ∞-categories if and only if it is essentially surjective, which (since r is evidently a categorical fibration) is equivalent to the requirement that r be surjective on vertices. Consequently, in the definition of a $\mathfrak{P}$-fibered object of $(\mathcal{S}et_\Delta^+)_{/\mathfrak{P}}$, we are free to replace assumption (5) by the following apparently weaker condition:

(5′) For each $\alpha \in A$ and every coCartesian section s_0 of the projection $X \times_S K_\alpha \to K_\alpha$, there exists a coCartesian section s of $X \times_S K_\alpha^\triangleleft \to K_\alpha^\triangleleft$ extending s_0.

Remark B.0.27. Let $\mathfrak{P} = (M_S, T, \{p_\alpha : K_\alpha^\triangleleft \to S\}_{\alpha \in A})$ be a categorical pattern on a simplicial set S, and suppose we are given a $\mathfrak{P}$-fibered object $\overline{X} = (X, M) \in (\mathcal{S}et_\Delta^+)_{/\mathfrak{P}}$. Let $\pi : X \to S$ denote the underlying map of simplicial sets. We can define a categorical pattern $\pi^* \mathfrak{P} = (M, T', \{q_\beta : K_\beta^\triangleleft \to X\}_{\beta \in B})$ on X as follows:

(1) The set M is the collection of marked edges of X (in other words, the collection of locally π-coCartesian edges e of X such that $\pi(e) \in M_S$).

(2) The set $T' = \pi^{-1} T$ is the collection of all 2-simplices of X whose images in S belong to T.

(3) We let $\{q_\beta : K_\beta^\triangleleft \to X\}_{\beta \in B}$ be the collection of those diagrams $q : K^\triangleleft \to X$ such that q carries each edge of $K^\triangleleft$ into M, and $\pi \circ q$ belongs to $\{p_\alpha : K_\alpha^\triangleleft \to S\}_{\alpha \in A}$.

Remark B.0.28. Let S be a simplicial set, and suppose we are given a categorical pattern $\mathfrak{P} = (M_S, T, \{p_\alpha : K_\alpha^\triangleleft \to S\}_{\alpha \in A})$, where M_S consists of all edges of S, T consists of all 2-simplices of S, each of the simplicial sets K_α is weakly contractible and each of the maps p_α is constant. Then the model structure on $(\mathcal{S}et_\Delta^+)_{/\mathfrak{P}}$ described by Theorem B.0.20 coincides with the coCartesian model structure of Example B.0.21: this follows immediately from Remark B.0.24.

B.1 $\mathfrak{P}$-Anodyne Morphisms

Let $\mathfrak{P}$ be a categorical pattern on a simplicial set S. The main step in proving Theorem B.0.20 is to show that there is a sufficiently large supply of trivial cofibrations in $(\mathcal{S}et_\Delta^+)_{/\mathfrak{P}}$. To this end, we

小红书
小红书号:3189205503 qq

introduce the following definition:

Definition B.1.1. Let $\mathfrak{P} = (M_S, T, \{p_\alpha : K_\alpha^\triangleleft \to S\}_{\alpha \in A})$ be a categorical pattern on a simplicial set S. The collection of $\mathfrak{P}$-*anodyne* morphisms in $(\mathcal{S}et_\Delta^+)_{/\mathfrak{P}}$ is the smallest weakly saturated (see Definition HTT.A.1.2.2) class of morphisms which contain all morphisms of the following types:

(A_0) The inclusion $(\Lambda_1^2)^\sharp \coprod_{(\Lambda_1^2)^\flat} (\Delta^2)^\flat \subseteq (\Delta^2)^\sharp$, for every map $\Delta^2 \to S$ belonging to T which carries every edge into M_S.

(A_1) The inclusion $Q^\flat \subseteq Q^\sharp$, where $Q = \Delta^0 \coprod_{\Delta^{\{0,2\}}} \Delta^3 \coprod_{\Delta^{\{1,3\}}} \Delta^0$ and the map $Q \to S$ carries every edge of Q into M_S and every 2-simplex of Q into T.

(B_0) The inclusion $\{0\}^\sharp \subseteq (\Delta^1)^\sharp$ lying over an edge of M_S.

(B_1) For each $\alpha \in A$, the inclusion $K_\alpha^\sharp \subseteq (K_\alpha^\triangleleft)^\sharp$ (where $K_\alpha^\triangleleft$ maps to S via p_α).

(C_0) The inclusion

$$(\Lambda_0^n)^\flat \coprod_{(\Delta^{\{0,1\}})^\flat} (\Delta^{\{0,1\}})^\sharp \subseteq (\Delta^n)^\flat \coprod_{(\Delta^{\{0,1\}})^\flat} (\Delta^{\{0,1\}})^\sharp,$$

for every $n > 1$ and every map $\Delta^n \to S$ whose restriction to $\Delta^{\{0,1,n\}}$ belongs to T.

(C_1) The inclusion $(\Lambda_i^n)^\flat \subseteq (\Delta^n)^\flat$, for every $0 < i < n$ and every map $\Delta^n \to S$.

(C_2) For each $n \geq 1$, $\alpha \in A$, and map $f : \Delta^n \star K_\alpha \to S$ extending $p_\alpha : \{n\} \star K_\alpha \to S$, the inclusion

$$(\partial \Delta^n \star K_\alpha)^\flat \coprod_{(\{n\} \star K_\alpha)^\flat} (\{n\} \star K_\alpha)^\sharp \subseteq (\Delta^n \star K_\alpha)^\flat \coprod_{(\{n\} \star K_\alpha)^\flat} (\{n\} \star K_\alpha)^\sharp).$$

Example B.1.2. Let $\mathfrak{P}$ be a categorical pattern on a simplicial set S, and suppose we are given maps of simplicial sets $A \xrightarrow{i} B \to S$. If i is inner anodyne, then the induced map $A^\flat \to B^\flat$ is a $\mathfrak{P}$-anodyne morphism in $(\mathcal{S}et_\Delta^+)_{/\mathfrak{P}}$.

Example B.1.3. Let $\mathfrak{P}$ be a categorical pattern on a simplicial set S, and let $e : \Delta^1 \to S$ be a marked edge of S. For every simplicial set A, let $\overline{A}^\triangleleft$ denote the marked simplicial set $(A^\triangleleft, M_A)$, where M_A is the collection of all edges of $A^\triangleleft$ which are either degenerate or contain the cone point. We regard $\overline{A}^\triangleleft$ as an object of $(\mathcal{S}et_\Delta^+)_{/\mathfrak{P}}$ via the map $A^\triangleleft \to (\Delta^0)^\triangleleft \simeq \Delta^1 \xrightarrow{e} S$. For any cofibration of simplicial sets $i : A \to B$, the induced map $j : \overline{A}^\triangleleft \to \overline{B}^\triangleleft$ is $\mathfrak{P}$-anodyne. To prove this, it suffices to treat the basic case where $B = \Delta^n$ and $A = \partial \Delta^n$, in which case the map j is a generating $\mathfrak{P}$-anodyne map which is either of type (B_0) (if $n = 0$) or (C_0) (if $n > 0$).

Example B.1.4. Let $\mathfrak{P} = (M_S, T, \{p_\alpha : K_\alpha^\triangleleft \to S\}_{\alpha \in A})$ be a categorical pattern on a simplicial set S. Let $B_0 \subseteq B$ be a simplicial sets containing a vertex b, and let $f : B \star K_\alpha \to S$ be a map whose

小红书
小红书号:3189205503 qq

restriction to $\{b\} \star K_\alpha \simeq K_\alpha^\triangleleft$ is given by p_α. Suppose that every simplex of B either belongs to B_0 or contains b as a final vertex. Then the inclusion

$$(B_0 \star K_\alpha)^\flat \coprod_{(\{b\} \star K_\alpha)^\flat} (\{b\} \star K_\alpha)^\sharp \subseteq (B \star K_\alpha)^\flat \coprod_{(\{b\} \star K_\alpha)^\flat} (\{b\} \star K_\alpha)^\sharp)$$

is $\mathfrak{P}$-anodyne, because it can be obtained as an iterated pushout of $\mathfrak{P}$-anodyne inclusions of type (C_2).

Remark B.1.5. Let $\mathfrak{P} = (M_S, T, \{p_\alpha : K_\alpha^\triangleleft \to S\}_{\alpha \in A})$ be a categorical pattern on a simplicial set S, and let $\overline{X} = (X, M)$ be an object of $(\mathcal{S}et_\Delta^+)_{/\mathfrak{P}}$. Let T' denote the inverse image of T in $\mathrm{Hom}_{\mathcal{S}\mathrm{et}_\Delta}(\Delta^2, X)$, and let B denote the set of pairs $\beta = (\alpha, \overline{p}_\beta)$ where $\alpha \in A$ and $\overline{p}_\beta : K_\alpha^\triangleleft \to X$ is a map lifting p_α. Then $\mathfrak{P}_{\overline{X}} = (M, T', \{\overline{p}_\beta\}_{\beta \in B})$ is a categorical pattern on X. Unwinding the definitions, we deduce that a morphism in $(\mathcal{S}et_\Delta^+)_{/\mathfrak{P}_{\overline{X}}}$ is $\mathfrak{P}_{\overline{X}}$-anodyne if and only if it is $\mathfrak{P}$-anodyne.

Our next result highlights the relevance of Definition B.1.1 to the proof of Theorem B.0.20:

Proposition B.1.6. Let $\mathfrak{P}$ be a categorical pattern on a simplicial set S, and let $\overline{X} \in (\mathcal{S}et_\Delta^+)_{/\mathfrak{P}}$. The following conditions are equivalent:

(1) The object $\overline{X}$ has the extension property with respect to every $\mathfrak{P}$-anodyne morphism in $(\mathcal{S}et_\Delta^+)_{/\mathfrak{P}}$.

(2) The object $\overline{X}$ is $\mathfrak{P}$-fibered.

The proof of Proposition B.1.6 will require the following preliminary result:

Lemma B.1.7. Let $n \geq 2$, and let $p : X \to \Delta^n$ be an inner fibration of simplicial sets. Consider a commutative diagram

$$\begin{array}{ccc} \Lambda_0^n & \xrightarrow{f_0} & X \\ \downarrow & \overset{f}{\nearrow} & \downarrow p \\ \Delta^n & \xrightarrow{\mathrm{id}} & \Delta^n, \end{array}$$

where f_0 carries $\Delta^{\{0,1\}} \subseteq \Lambda_0^n$ to a locally p'-coCartesian edge of $X \times_{\Delta^n} \Delta^{\{0,1,n\}}$, where p' denotes the projection $X \times_{\Delta^n} \Delta^{\{0,1,n\}} \to \Delta^{\{0,1,n\}}$. Then there exists a map $f : \Delta^n \to X$ as indicated, rendering the diagram commutative.

Proof. To prove the assertion, it will suffice to show that f_0 extends to an n-simplex of X (the compatibility with the projection p is automatic, since Λ_0^n contains every vertex of Δ^n). Choose a categorical equivalence $X \to \mathrm{N}(\mathcal{C})$, where $\mathcal{C}$ is a topological category (for example, we could take $\mathcal{C} = |\mathfrak{C}[X]|$). Note that the projection p factors (uniquely) through some projection map $\mathrm{N}(\mathcal{C}) \to \Delta^n$. Since p is an inner fibration, the simplicial set X is an ∞-category, and therefore fibrant with respect to the Joyal model structure. Consequently, it will suffice to prove the existence

小红书 小红书号:3189205503 qq

of the desired extension after replacing X by $\mathrm{N}(\mathcal{C})$. We may therefore assume that X is the nerve of a topological category $\mathcal{C}$.

The functor f_0 determines the following data in the topological category $\mathcal{C}$:

(1) A collection of objects $C_i = f_0(\{i\})$.

(2) A morphism $\alpha : C_0 \to C_1$ in $\mathcal{C}$, given by evaluating f_0 on the edge $\Delta^{\{0,1\}} \subseteq \Lambda^n_0$. Let $q : \mathrm{Map}_{\mathcal{C}}(C_1, C_n) \to \mathrm{Map}_{\mathcal{C}}(C_0, C_n)$ be the map induced by composition with α. Since α is locally p-coCartesian, it is coCartesian with respect to the projection $X \times_{\Delta^n} \Delta^{\{0,1,n\}} \to \Delta^{\{0,1,n\}}$, so that q is a weak homotopy equivalence.

(3) A continuous map $g_0 : \partial[0,1]^{n-2} \to \mathrm{Map}_{\mathcal{C}}(C_1, C_n)$, given by evaluating f_0 on $\partial\,\Delta^{\{1,2,\ldots,n\}}$.

(4) Another continuous map

$$H_0 : ((\partial[0,1]^{n-2}) \times [0,1]) \coprod_{\partial[0,1]^{n-2} \times \{0\}} ([0,1]^{n-2} \times \{0\}) \to \mathrm{Map}_{\mathcal{C}}(C_0, C_n)$$

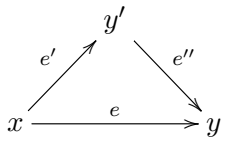
such that the restriction $H_0|(\partial[0,1]^{n-2} \times \{1\})$ coincides with the composition

$$\partial[0,1]^{n-2} \xrightarrow{g_0} \mathrm{Map}_{\mathcal{C}}(C_1, C_n) \xrightarrow{q} \mathrm{Map}_{\mathcal{C}}(C_0, C_n).$$

Let $h_1 = H_0|([0,1]^{n-2} \times \{0\})$. We can regard the restriction $H_0|(\partial[0,1]^{n-2} \times [0,1])$ as a homotopy from $q \circ g_0$ to $h_1 | \partial[0,1]^{n-2}$. Unwinding the definitions, we see that producing the desired extension f is equivalent to extending H_0 to a homotopy from $q \circ g$ to h_1, for some continuous map $g : [0,1]^{n-2} \to \mathrm{Map}_{\mathcal{C}}(C_1, C_n)$. The existence of H (and g) now follows easily from the fact that q is a weak homotopy equivalence. □

Proof of Proposition B.1.6. Let $\mathfrak{P} = (M_S, T, \{p_\alpha : K_\alpha^{\triangleleft} \to S\}_{\alpha \in A})$ be a categorical pattern on the simplicial set S, and let $\overline{X}$ be an object of $(\mathcal{S}et^+_\Delta)_{/\mathfrak{P}}$. We wish to show that $\overline{X}$ is $\mathfrak{P}$-fibered if and only if it has the extension property with respect to every $\mathfrak{P}$-anodyne morphism. We begin by proving the "if" direction. Let $\overline{X} = (X, M)$, and let $q : X \to S$ denote the underlying map of simplicial sets. We will show that $\overline{X}$ satisfies conditions (1), (2), (3), (4) and (6) of Definition B.0.19, together with condition (5′) of Remark B.0.26:

(1) We must show that $q : X \to S$ is an inner fibration. This is equivalent to our assumption that $\overline{X}$ has the unique extension property with respect to every morphism of type (C_1) appearing in Definition B.1.1.



(2) Let $\overline{e} : \Delta^1 \to S$ belong to M_S, let $X' = X \times_S \Delta^1$, and let $q' : X' \to \Delta^1$ denote the projection map. We wish to prove that q' is a coCartesian fibration. Let M' denote the collection of edges in X' whose image in X belongs to M. Since $\overline{X}$ has the extension property with

小红书
小红书号:3189205503 qq

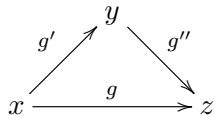
respect to morphisms of the type (C_0) appearing in Definition B.1.1, we deduce that every edge of M' is q'-coCartesian. The existence of a sufficient supply of such edges follows from the assumption that q has the extension property with respect to morphisms of type (B_0).

(3) Let $\overline{e}$, X', and q' be as in (2). We claim that an edge $e : x \to y$ of X' lifting $\overline{e}$ is q'-coCartesian if and only if $e \in M'$. The "if" direction follows from the above arguments. To prove the converse, we first treat the case where the edge $\overline{e}$ is degenerate, corresponding to a vertex $s \in S$. Let X_s denote the ∞-category $X \times_S \{s\}$, so that e is an equivalence in X_s and therefore belongs to $X_s^{\simeq}$. Let $Q = \Delta^0 \coprod_{\Delta^{\{0,2\}}} \Delta^3 \coprod_{\Delta^{\{1,3\}}} \Delta^0$, and let Q' denote the image of $\Delta^{\{1,2\}} \subseteq \Delta^3$ in K. The inclusion $Q' \subseteq Q$ is a weak homotopy equivalence. Consequently, the map $Q' \to Y$ determined by the edge e extends to a map $Q \to X_s^{\simeq}$. Since $\overline{X}$ has the extension property with respect to morphisms of type (A_1) appearing in Definition B.1.1, we deduce that the induced map $Q \to X$ carries each edge of Q into M, so that $e \in M$.

We now treat the general case where $\overline{e}$ is not assumed to be degenerate. Using the extension property with respect to morphisms of type (B_0), we can choose an edge $e' : x \to y'$ in M' which lies over $\overline{e}$. Since e' is q'-coCartesian, we can choose a 2-simplex

lying over the edge $\overline{e}$ in S', where e'' is an edge of the fiber $X'_{q'(y)}$. Since e is also q'-coCartesian, we deduce that e'' is an equivalence in $X'_{q'(y)}$, so that $e'' \in M$ by the above argument. Invoking our assumption that $\overline{X}$ has the extension property with respect to morphisms of the type (A_0), we deduce that $e \in M'$, as desired.

(4) Let $\Delta^2 \to S$ be a 2-simplex which belongs to T, let $X' = X \times_S \Delta^2$, and let e be an edge of X' lying over $\Delta^{\{0,1\}}$ whose image in X belongs to M. We wish to prove that e is q'-coCartesian, where q' denotes the projection map $X' \to \Delta^2$. This follows immediately from our assumption that $\overline{X}$ has the extension property with respect to morphisms of the type (C_0).



(5′) Fix an index $\alpha \in A$. Let $q_\alpha : X \times_S K_\alpha^{\triangleleft} \to K_\alpha^{\triangleleft}$ denote the projection map, and let $q_\alpha^0 : K \times_S K_\alpha \to K_\alpha$ its restriction. We must show that every coCartesian section of q_α^0 can be extended to a coCartesian section of q_α. In view of (3), this is equivalent to the requirement that $\overline{X}$ have the extension property with respect to morphisms of type (B_1) in Definition B.1.1.

(6) Let α and q_α be as in (4′); we must show that every coCartesian section of q_α is a q-limit diagram. In view of (3), this is equivalent the requirement that $\overline{X}$ has the extension property with respect to all morphisms of type (C_2) appearing in Definition B.1.1.

小红书
小红书号:3189205503 qq

We now prove the "only if" direction. Assume that $\overline{X}$ is $\mathfrak{P}$-fibered. We will show that $\overline{X}$ has the extension property with respect to every $\mathfrak{P}$-anodyne morphism $f : A \to B$ in $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$. It will suffice to treat the case where f is one of the generating $\mathfrak{P}$-anodyne morphisms appearing in Definition B.1.1. For morphisms of the types (B_1), (C_1), and (C_2), the relevant assertion follows from the arguments given above in cases $(5')$, (1), and (6), respectively. There are several more cases to consider:

(A_0) The map f is an inclusion $(\Lambda^2_1)^\sharp \coprod_{(\Lambda^2_1)^\flat} (\Delta^2)^\flat \subseteq (\Delta^2)^\sharp$, for some 2-simplex $\Delta^2 \to S$ belonging to T. Let $X' = X \times_S \Delta^2$, and let $q' : X' \to \Delta^2$ denote the projection. To prove that $\overline{X}$ has the extension property with respect to f, we must show that if we are given a 2-simplex

in X' such that g' and g'' are locally q'-coCartesian, then g is locally q'-coCartesian. We observe that g'' is automatically q'-coCartesian, and the hypothesis that $\overline{X}$ is $\mathfrak{P}$-fibered guarantees that g' is q'-coCartesian. It follows from Proposition HTT.2.4.1.7 that g is q'-coCartesian.

(A_1) The map f is an inclusion $Q^\flat \subseteq Q^\sharp$, where $Q = \Delta^0 \coprod_{\Delta^{\{0,2\}}} \Delta^3 \coprod_{\Delta^{\{1,3\}}} \Delta^0$, and the map $Q \to S$ carries each edge of Q into M_S and each 2-simplex of Q into T. Let $X' = X \times_S Q$ and let $q' : X' \to Q$ denote the projection map. It follows from Corollary HTT.2.4.2.10 that q' is a coCartesian fibration, classified by some functor $\chi : Q \to \mathcal{C}\mathrm{at}_\infty$. Since the projection $Q \to \Delta^0$ is a categorical equivalence, the functor χ is equivalent to a constant functor; it follows that X' is equivalent to a product $Q \times \mathcal{C}$, for some ∞-category $\mathcal{C}$. To show that $\overline{X}$ has the extension property with respect to f, it suffices to show that every section of q' is coCartesian. Replacing X' by $Q \times \mathcal{C}$, we are reduced to proving that every diagram $Q \to \mathcal{C}$ carries each edge of Q to an equivalence in $\mathcal{C}$, which follows from a simple diagram chase.

(B_0) The map f is an inclusion $\{0\}^\sharp \subseteq (\Delta^1)^\sharp$ lying over an edge of M_S. Since the induced map $X \times_S \Delta^1 \to \Delta^1$ is a coCartesian fibration, the object $\overline{X}$ has the extension property with respect to f.

(C_0) The map f is an inclusion

$$(\Lambda^n_0)^\flat \coprod_{(\Delta^{\{0,1\}})^\flat} (\Delta^{\{0,1\}})^\sharp \subseteq (\Delta^n)^\flat \coprod_{(\Delta^{\{0,1\}})^\flat} (\Delta^{\{0,1\}})^\sharp,$$

for every $n > 1$ and every map $\Delta^n \to S$ which carries $\Delta^{\{0,1,n\}}$ into S'. The desired result in this case is a reformulation of Lemma B.1.7.

□

小红书
小红书号:3189205503 qq

We next show that the class of $\mathfrak{P}$-anodyne morphisms behaves well with respect to products. For a more precise statement, we need to introduce a bit of notation.

Definition B.1.8. Let S and S' be simplicial sets, and let $\mathfrak{P} = (M_S, T, \{p_\alpha : K_\alpha^\triangleleft \to S\}_{\alpha \in A})$ and $\mathfrak{P}' = (M'_{S'}, T', \{q_\beta : L_\beta^\triangleleft \to S'\}_{\beta \in B})$ be categorical patterns on S and S', respectively. We let $\mathfrak{P} \times \mathfrak{P}'$ denote the categorical pattern

$$(M_S \times M'_{S'}, T \times T', \{K_\alpha^\triangleleft \xrightarrow{p_\alpha} S \times \{s'\} \to S \times S'\}_{\alpha \in A, s' \in S'} \cup \{L_\beta^\triangleleft \xrightarrow{q_\beta} \{s\} \times S' \to S \times S'\}_{s \in S, \beta \in B})$$

on the product $S \times S'$.

Proposition B.1.9. Let $\mathfrak{P}$ and $\mathfrak{P}'$ be categorical patterns on simplicial sets S and S'. Let $f : \overline{X} \to \overline{Y}$ be a cofibration in $(\mathcal{S}et^+_\Delta)_{/\mathfrak{P}}$, and let $f' : \overline{X}' \to \overline{Y}'$ be a cofibration in $(\mathcal{S}et^+_\Delta)_{/\mathfrak{P}'}$. If f is $\mathfrak{P}$-anodyne or f' is $\mathfrak{P}'$-anodyne, then the induced map

$$f \wedge f' : (\overline{Y} \times \overline{X}') \coprod_{\overline{X} \times \overline{X}'} (\overline{X} \times \overline{Y}') \to \overline{Y} \times \overline{Y}'$$

is $\mathfrak{P} \times \mathfrak{P}'$-anodyne.

Lemma B.1.10. Let $\mathfrak{P} = (M_S, T, \{K_\alpha^\triangleleft \to S\}_{\alpha \in A})$ be a categorical pattern on a simplicial set S. Let $B_0 \subseteq B$ be an inclusion of simplicial sets, and let $f : \Delta^1 \times B \to S$ be a map with the following properties:

- For every simplex $\sigma : \Delta^n \to B$ which does not belong to B_0, let τ be the 2-simplex of $\Delta^1 \times \Delta^n$ spanned by $(0,0)$, $(1,0)$ and $(1,n)$. Then the induced map

  $$\Delta^2 \xrightarrow{\tau} \Delta^1 \times \Delta^n \xrightarrow{\sigma} \Delta^1 \times B \xrightarrow{f} S$$

  belongs to T.
- For every vertex b of B, the map f carries $\Delta^1 \times \{b\}$ into M_S.

Then the inclusion

$$((\Delta^1)^\sharp \times B_0^\flat) \coprod_{\{0\}^\sharp \times B_0^\flat} (\{0\}^\sharp \times B^\flat) \subseteq (\Delta^1)^\sharp \times B^\flat$$

is $\mathfrak{P}$-anodyne.

Proof. Working simplex-by-simplex, we can reduce to the case where $B = \Delta^n$ and $B_0 = \partial \Delta^n$. The simplicial set $\Delta^1 \times \Delta^n$ admits a filtration

$$(\{0\} \times \Delta^n) \coprod_{\{0\} \times \partial \Delta^n} (\Delta^1 \times \partial \Delta^n) = Z_0 \subset Z_1 \subset \ldots \subset Z_n \subseteq Z_{n+1} = \Delta^1 \times \Delta^n,$$

小红书
小红书号:3189205503 qq

where each Z_{i+1} is obtained from Z_i by adjoining the $(n+1)$-simplex of $\Delta^1 \times \Delta^n$ corresponding to the map

$$\sigma_i : [n+1] \to [1] \times [n]$$

$$\sigma_i(j) = \begin{cases} (0, j) & \text{if } j \leq n - i \\ (1, j-1) & \text{if } j > n - i. \end{cases}$$

Let $\overline{Z_i} = (Z_i, M_i)$ denote the marked simplicial set whose marked edges are precisely those edges which are marked in $(\Delta^1)^\sharp \times (\Delta^1)^\flat$. We wish to show that the inclusion $\overline{Z}_0 \subseteq \overline{Z}_{n+1}$ is $\mathfrak{P}$-anodyne. For this, it will suffice to show that each of the inclusions $h_i : \overline{Z}_i \subseteq \overline{Z}_{i+1}$ is $\mathfrak{P}$-anodyne. If $i = n = 0$, then h_i is a generating $\mathfrak{P}$-anodyne morphism of type (B_0). If $0 \leq i < n$, then h_i is a pushout of a generating $\mathfrak{P}$-anodyne morphism of type (C_1). If If $i = n > 0$, then h_i is a pushout of a generating $\mathfrak{P}$-anodyne morphism of type (C_0). □

Proof of Proposition B.1.9. Let $\mathfrak{P} = (M_S, T, \{p_\alpha : K_\alpha^\triangleleft \to S\}_{\alpha \in A})$ and $\mathfrak{P}' = (M'_{S'}, T', \{q_\beta : L_\beta^\triangleleft \to S'\}_{\beta \in B})$ be categorical patterns on simplicial sets S and S', respectively. Let $f : \overline{X} \to \overline{Y}$ be a $\mathfrak{P}$-anodyne morphism in $(\mathcal{S}et_\Delta^+)_{/\mathfrak{P}}$, and let $f' : \overline{X}' \to \overline{Y}'$ be an arbitrary cofibration in $(\mathcal{S}et_\Delta^+)_{/\mathfrak{P}'}$. We wish to show that $f \wedge f'$ is $\mathfrak{P} \times \mathfrak{P}'$-anodyne. Without loss of generality, we may assume that f' is a generator for the class of cofibrations in $(\mathcal{S}et_\Delta^+)_{/\mathfrak{P}'}$, having either the form $(\Delta^1)^\flat \subseteq (\Delta^1)^\sharp$ or $(\partial \Delta^m)^\flat \subseteq (\Delta^m)^\flat$. Similarly, we may assume that f is one of the generating $\mathfrak{P}$-anodyne morphisms described in Definition B.1.1. There are fourteen cases to consider:

- (A_0) The map f is an inclusion $(\Lambda^2_1)^\sharp \coprod_{(\Lambda^2_1)^\flat} (\Delta^2)^\flat \subseteq (\Delta^2)^\sharp$ where $\Delta^2 \to S$ belongs to T and carries every edge into M_S, and f' is an inclusion $(\Delta^1)^\flat \subseteq (\Delta^1)^\sharp$. In this case, $f \wedge f'$ can be obtained as a composition of two morphisms, each of which is a pushout of a morphism having type (A_0).

- (A_1) The map f is an inclusion $Q^\flat \subseteq Q^\sharp$, where $Q = \Delta^0 \coprod_{\Delta^{\{0,2\}}} \Delta^3 \coprod_{\Delta^{\{1,3\}}} \Delta^0$ and the map $Q \to S$ carries every edge of Q into M_S and every 2-simplex of Q into T, and f' is an inclusion $(\Delta^1)^\flat \subseteq (\Delta^1)^\sharp$. In this case, $f \wedge f'$ can be obtained as a successive pushout of two morphisms of type (A_0).

- (B_0) The map f is an inclusion $\{0\}^\sharp \subseteq (\Delta^1)^\sharp$, for some edge $\Delta^1 \to S$ belonging to M_S, and f' is an inclusion $(\Delta^1)^\flat \subseteq (\Delta^1)^\sharp$. In this case, $f \wedge f'$ can be obtained as a composition of two morphisms which are pushouts of maps of type (A_0) and the $\mathfrak{P}$-anodyne morphism of Lemma B.1.11.

- (B_1) For some $\alpha \in A$, the map f is an inclusion $K_\alpha^\sharp \subseteq (K_\alpha^\triangleleft)^\sharp$ (where $K_\alpha^\triangleleft$ maps to S via p_α), and f' is an inclusion $(\Delta^1)^\flat \subseteq (\Delta^1)^\sharp$. We can factor the morphism $f \wedge f'$ as a composition

$$(K_\alpha^\triangleleft \times \Delta^1, M) \xrightarrow{g} (K_\alpha^\triangleleft \times \Delta^1, M') \xrightarrow{g'} (K_\alpha^\triangleleft \times \Delta^1)^\sharp,$$

小红书 小红书号:3189205503 qq

where M' is the collection of all edges of $K_\alpha^\triangleleft \times \Delta^1$ except for $\{v\} \times \Delta^1$, where v is the cone point of $K_\alpha^\triangleleft$, and $M \subseteq M'$ is the collection of all those edges which do not join $(v, 0)$ to a vertex of $K_\alpha^\triangleleft \times \{1\}$. We begin by observing that g is a pushout of a coproduct of morphisms of type (A_0), indexed by the collection of vertices of K_α. It will therefore suffice to show that g' is $(\mathfrak{P} \times \mathfrak{P}')$-anodyne, which follows from the observation that g' is a pushout of a morphism of the type described in Lemma B.1.12.

(C) The map f is a generating $\mathfrak{P}$-anodyne morphism of one of the types (C_0), (C_1), or (C_2) described in Definition B.1.1, and f' is an inclusion $(\Delta^1)^\flat \subseteq (\Delta^1)^\sharp$. In this case, $f \wedge f'$ is an isomorphism and there is nothing to prove.

(A_0') The map f is an inclusion $(\Lambda_1^2)^\sharp \coprod_{(\Lambda_1^2)^\flat} (\Delta^2)^\flat \subseteq (\Delta^2)^\sharp$ where $\Delta^2 \to S$ belongs to T and carries every edge into M_S, and f' is an inclusion $(\partial \Delta^m)^\flat \subseteq (\Delta^m)^\flat$. If $m = 0$, then $f \wedge f'$ is a generating $(\mathfrak{P} \times \mathfrak{P}')$-anodyne morphism of type (A_0). If $m > 0$, then $f \wedge f'$ is an isomorphism.

(A_1') The map f is an inclusion $Q^\flat \subseteq Q^\sharp$, where $Q = \Delta^0 \coprod_{\Delta^{\{0,2\}}} \Delta^3 \coprod_{\Delta^{\{1,3\}}} \Delta^0$ and the map $Q \to S$ carries every edge of Q into M_S and every 2-simplex of S into T, and f' is an inclusion $(\partial \Delta^m)^\flat \subseteq (\Delta^m)^\flat$. If $m = 0$ then $f \wedge f'$ is a generating $(\mathfrak{P} \times \mathfrak{P}')$-anodyne morphism of type (A_1), and if $m > 0$ then $f \wedge f'$ is an isomorphism.

(B_0') The map f is an inclusion $\{0\}^\sharp \subseteq (\Delta^1)^\sharp$, for some edge $\Delta^1 \to S$ belonging to M_S, and f' is an inclusion $(\partial \Delta^m)^\flat \subseteq (\Delta^m)^\flat$. If $m = 0$, then $f \wedge f'$ is a generating $(\mathfrak{P} \times \mathfrak{P}')$-anodyne morphism of type (B_0). Let us assume therefore that $m > 0$. For $0 \leq k \leq m$, let $\sigma_k : \Delta^{m+1} \to \Delta^1 \times \Delta^m$ denote the simplex determined by the map of partially ordered sets $[m+1] \to [1] \times [m]$ given by the formula

$$j \mapsto \begin{cases} (0, j) & \text{if } j \leq m - k \\ (1, j-1) & \text{otherwise.} \end{cases}$$

We have a sequence of simplicial sets

$$Z_0 \subseteq Z_1 \subseteq \ldots \subseteq Z_{m+1} = \Delta^1 \times \Delta^m$$

where Z_i is the simplicial subset of $\Delta^1 \times \Delta^m$ generated by $\Delta^1 \times (\partial \Delta^m)$, $\{0\} \times \Delta^m$, and $\{\sigma_j\}_{j<i}$. Let M denote the collection of edges of $\Delta^1 \times \Delta^m$ whose image in Δ^m is degenerate, and let $\overline{Z}_i = (Z_i, M)$. To prove that $f \wedge f'$ is $(\mathfrak{P} \times \mathfrak{P}')$-anodyne, it will suffice to show that each of the inclusions $g_i : \overline{Z}_i \subseteq \overline{Z}_{i+1}$ is $\mathfrak{P}$-anodyne. For $0 \leq i < m$, we observe that g_i is a pushout of a generating $(\mathfrak{P} \times \mathfrak{P}')$-anodyne morphism of type (C_1). For $i = m$, we note that g_i is a pushout of a generating $(\mathfrak{P} \times \mathfrak{P}')$-anodyme morphism of type (C_0).

(B_1') For some $\alpha \in A$, the map f is an inclusion $K_\alpha^\sharp \subseteq (K_\alpha^\triangleleft)^\sharp$ (where $K_\alpha^\triangleleft$ maps to S via p_α), and f' is an inclusion $(\partial \Delta^m)^\flat \subseteq (\Delta^m)^\flat$. If $m = 0$, then $f \wedge f'$ is a generating $\mathfrak{P} \times \mathfrak{P}'$-anodyne

小红书
小红书号:3189205503 qq

morphism of type (B_1) and there is nothing to prove. Let us assume therefore that $m > 0$. Let v denote the cone point of $K_\alpha^\triangleleft$. We define a filtration

$$Z_0 \subseteq Z_1 \subseteq \ldots \subseteq Z_m \subseteq Z_{m+1} = K_\alpha^\triangleleft \times \Delta^m$$

as follows. For each $i \leq m$, let Z_i denote the simplicial subset of $K_\alpha^\triangleleft \times \Delta^m$ generated by those simplices σ such that either $\sigma \cap (\{v\} \times \Delta^m) \subseteq \{v\} \times \Delta^{\{0,\ldots,i-1\}}$ or the projection map $\sigma \to \Delta^m$ is not surjective. Let $\overline{Z}_i$ denote the marked simplicial set (Z_i, M_i), where M_i is the collection of those edges of Z_i whose image in Δ^m is degenerate. The map $f \wedge f'$ can be identified with the inclusion $\overline{Z}_0 \subseteq \overline{Z}_{m+1}$. It will therefore suffice to show that each of the inclusions $g_i : \overline{Z}_i \subseteq \overline{Z}_{i+1}$ is $(\mathfrak{P} \times \mathfrak{P}')$-anodyne. If $i < m$, then g_i is a pushout of the inclusion $B^\flat \subseteq (\Delta^i \star (K_\alpha \times \Delta^{m-i})^\flat$, where B denotes the pushout

$$(\partial \Delta^i \star (K_\alpha \times \Delta^{m-i}) \coprod_{\partial \Delta^i \star (K_\alpha \times \Lambda_0^{m-i})} (\Delta^i \star (K_\alpha \times \Delta^{m-i})).$$

In view of Example B.1.2, it will suffice to show that the inclusion of simplicial sets $B \subseteq \Delta^i \star (K_\alpha \times \Delta^{m-i})$ is inner anodyne. This follows from Lemma HTT.2.1.2.3 , since the inclusion $K_\alpha \times \Lambda_0^{m-i} \subseteq K_\alpha \times \Delta^{m-i}$ is left anodyne (Corollary HTT.2.1.2.7).

In the case $i = m$, we observe that g_i is a pushout of the inclusion

$$((\partial \Delta^m) \star K_\alpha)^\flat \coprod_{(\{m\} \star K_\alpha)^\flat} (\{m\} \star K_\alpha)^\sharp \subseteq (\Delta^m \star K_\alpha)^\flat \coprod_{(\{m\} \star K_\alpha)^\flat} (\{m\} \star K_\alpha)^\sharp,$$

which is a $(\mathfrak{P} \times \mathfrak{P}')$-anodyne morphism of type (C_2).

(C_0') The map f is an inclusion

$$(\Lambda_0^n)^\flat \coprod_{(\Delta^{\{0,1\}})^\flat} (\Delta^{\{0,1\}})^\sharp \subseteq (\Delta^n)^\flat \coprod_{(\Delta^{\{0,1\}})^\flat} (\Delta^{\{0,1\}})^\sharp,$$

for some $n > 1$ such that the map $\Delta^n \to S$ carries $\Delta^{\{0,1,n\}}$ to a 2-simplex belonging to T, and f' is an inclusion $(\partial \Delta^m)^\flat \subseteq (\Delta^m)^\flat$. If $m = 0$, then $f \wedge f'$ is a $(\mathfrak{P} \times \mathfrak{P}')$-anodyne morphism of type (C_0). We may therefore assume without loss of generality that $m > 0$. We define maps

$$\Delta^n \xrightarrow{s} \Delta^1 \times \Delta^n \xrightarrow{r} \Delta^n$$

by the formulae

$$s(i) = (1, i)$$

$$r(i,j) = \begin{cases} 0 & \text{if } i = 0, j = 1 \\ j & \text{otherwise.} \end{cases}$$

小红书
小红书号:3189205503 qq

These maps exhibit f as a retract of the inclusion

$$g : ((\Delta^1)^\sharp \times (\Lambda^n_0)^\flat) \coprod_{\{0\}^\sharp \times (\Lambda^n_0)^\flat} (\{0\}^\sharp \times (\Delta^n)^\flat) \subseteq (\Delta^1)^\sharp \times (\Delta^n)^\flat.$$

We regard $(\Delta^1)^\sharp \times (\Delta^n)^\flat$ as an object of $(\mathcal{S}et^+_\Delta)_{/\mathfrak{P}}$ via the composition

$$\Delta^1 \times \Delta^n \xrightarrow{r} \Delta^n \to S.$$

Since f is a retract of g, it will suffice to show that $g \wedge f'$ is $(\mathfrak{P} \times \mathfrak{P}')$-anodyne, which follows immediately from Lemma B.1.10.

(C'_1) The map f is an inclusion $(\Lambda^n_i)^\flat \subseteq (\Delta^n)^\flat$, for where $0 < i < n$, and f' is an inclusion $(\partial\, \Delta^m)^\flat \subseteq (\Delta^m)^\flat$. In this case, $f \wedge f'$ is a morphism of the form $B^\flat_0 \subseteq B^\flat$, where $B_0 \subseteq B$ is an inner anodyne inclusion of simplicial sets (Corollary HTT.2.3.2.4). It follows from Example B.1.2 that $f \wedge f'$ is $(\mathfrak{P} \times \mathfrak{P}')$-anodyne.

(C'_2) The map f has the form

$$(\partial\, \Delta^n \star K_\alpha)^\flat \coprod_{(\{n\} \star K_\alpha)^\flat} (\{n\} \star K_\alpha)^\sharp \subseteq (\Delta^n \star K_\alpha)^\flat \coprod_{(\{n\} \star K_\alpha)^\flat} (\{n\} \star K_\alpha)^\sharp)$$

for some $\alpha \in A$ and $n > 0$, where $\Delta^n \star K_\alpha \to S$ extends p_α, and f' is an inclusion of the form $(\partial\, \Delta^m)^\flat \subseteq (\Delta^m)^\flat$. The treatment of this case is similar to that of (B'_1). If $m = 0$, then $f \wedge f'$ is a generating $\mathfrak{P} \times \mathfrak{P}'$-anodyne morphism of type (C_2) and there is nothing to prove. Let us assume therefore that $m > 0$. We define a filtration

$$Z_0 \subseteq Z_1 \subseteq \ldots \subseteq Z_m \subseteq Z_{m+1} = (\Delta^n \star K_\alpha) \times \Delta^m$$

as follows. For each $i \leq m$, let Z_i denote the simplicial subset of $(\Delta^n \star K_\alpha) \times \Delta^m$ generated by those simplices σ such that either $\sigma \cap (\Delta^n \times \Delta^m) \subseteq \Delta^n \times \Delta^{\{0,\ldots,i-1\}}$ or the projection map $\sigma \to \Delta^m$ is not surjective. Let $\overline{Z}_i$ denote the marked simplicial set (Z_i, M_i), where M_i is the collection of those edges of Z_i which are marked in the product

$$((\Delta^n \star K_\alpha)^\flat \coprod_{(\{n\} \star K_\alpha)^\flat} (\{n\} \star K_\alpha)^\sharp)) \times (\Delta^m)^\flat.$$

The map $f \wedge f'$ can be identified with the inclusion $\overline{Z}_0 \subseteq \overline{Z}_{m+1}$. It will therefore suffice to show that each of the inclusions $g_i : \overline{Z}_i \subseteq \overline{Z}_{i+1}$ is $(\mathfrak{P} \times \mathfrak{P}')$-anodyne. If $i < m$, then g_i is a pushout of the inclusion $B^\flat \subseteq ((\Delta^n \times \Delta^i) \star (K_\alpha \times \Delta^{m-i})^\flat$, where B denotes the pushout

$$(\partial(\Delta^n \times \Delta^i) \star (K_\alpha \times \Delta^{m-i}) \coprod_{\partial(\Delta^n \times \Delta^i) \star (K_\alpha \times \Lambda^{m-i}_0)} ((\Delta^n \times \Delta^i) \star (K_\alpha \times \Delta^{m-i})).$$

小红书
小红书号:3189205503 qq

In view of Example B.1.2, it will suffice to show that the inclusion of simplicial sets $B \subseteq (\Delta^n \times \Delta^i) \star (K_\alpha \times \Delta^{m-i})$ is inner anodyne. This follows from Lemma HTT.2.1.2.3 , since the inclusion $K_\alpha \times \Lambda^{m-i}_0 \subseteq K_\alpha \times \Delta^{m-i}$ is left anodyne (Corollary HTT.2.1.2.7).

In the case $i = m$, we observe that g_i is a pushout of the inclusion

$$(\partial(\Delta^n \times \Delta^m) \star K_\alpha)^\flat \coprod_{(\{(n,m)\} \star K_\alpha)^\flat} (\{(n,m)\} \star K_\alpha)^\sharp \subseteq ((\Delta^n \times \Delta^m) \star K_\alpha)^\flat \coprod_{(\{(n,m)\} \star K_\alpha)^\flat} (\{(n,m)\} \star K_\alpha)^\sharp,$$

which is $(\mathfrak{P} \times \mathfrak{P}')$-anodyne (Example B.1.4).

□

Lemma B.1.11. Let $\mathfrak{P} = (M_S, T, \{p_\alpha : K_\alpha^\triangleleft \to S\}_{\alpha \in A})$ be a categorical pattern on a simplicial set S, and let $\Delta^2 \to S$ be a 2-simplex which belongs to T. Then the inclusion $i : (\Lambda^2_0)^\sharp \coprod_{(\Lambda^2_0)^\flat} (\Delta^2)^\flat \subseteq (\Delta^2)^\sharp$ is a $\mathfrak{P}$-anodyne morphism in $(\mathcal{S}et^+_\Delta)_{/\mathfrak{P}}$.

Proof. We must show that i has the left lifting property with respect to every morphism morphism $f : \overline{X} \to \overline{Y}$ in $(\mathcal{S}et^+_\Delta)_{/\mathfrak{P}}$, provided that f has the right lifting property with respect to every $\mathfrak{P}$-anodyne morphism in $(\mathcal{S}et^+_\Delta)_{/\mathfrak{P}}$. Replacing $\mathfrak{P}$ by $\mathfrak{P}_{\overline{Y}}$ (and invoking Remark B.1.5), we are reduced to showing that $\overline{X}$ has the extension property with respect to i, provided that $\overline{X}$ has the extension property with respect to every $\mathfrak{P}$-anodyne morphism. In view of Proposition B.1.6, we may assume that $\overline{X}$ is $\mathfrak{P}$-fibered. The desired result is now an immediate consequence of Proposition HTT.2.4.1.7 . □

Lemma B.1.12. Let $\mathfrak{P} = (M_S, T, \{p_\alpha : K_\alpha^\triangleleft \to S\}_{\alpha \in A})$ be a categorical pattern on a simplicial set S. Fix $\alpha \in A$, let M be the collection of all edges of $\Delta^1 \star K_\alpha$ except for the initial edge $\Delta^1 \subseteq \Delta^1 \star K_\alpha$. Let $f : \Delta^1 \star K_\alpha \to S$ be a map such which carries each edge into M_S, each 2-simplex into T, and such that $f|(\{1\} \star K_\alpha)$ agrees with p_α. Then the inclusion $i : (\Delta^1 \star K_\alpha, M) \subseteq (\Delta^1 \star K_\alpha)^\sharp$ is a $\mathfrak{P}$-anodyne morphism in $(\mathcal{S}et^+_\Delta)_{/\mathfrak{P}}$.

Proof. Let $g : \overline{X} \to \overline{Y}$ be a morphism in $(\mathcal{S}et^+_\Delta)_{/\mathfrak{P}}$ which has the right lifting property with respect to every $\mathfrak{P}$-anodyne morphism; we will show that g has the right lifting property with respect to i. Replacing $\mathfrak{P}$ by $\mathfrak{P}_{\overline{Y}}$ (and invoking Remark B.1.5), we may assume that $\overline{Y}$ is a final object of $(\mathcal{S}et^+_\Delta)_{/\mathfrak{P}}$. Proposition B.1.6 now guarantees that $\overline{X}$ is $\mathfrak{P}$-fibered. Let X' denote the fiber product $X \times_S (\Delta^1 \star K_\alpha)$, so that the projection map $q : X' \to (\Delta^1 \star K_\alpha)$ is a coCartesian fibration. Unwinding the definitions, we must show the following:

(∗) Let s be a section of q. If s carries each edge of M to a q-coCartesian edge of X', then s carries every edge of $\Delta^1 \star K_\alpha$ to a q-coCartesian edge of X'.

To prove (∗), let us write rewrite the domain of s as $\{x\} \star \{z\} \star K_\alpha$. Choose a q-coCartesian edge $e : s(x) \to \overline{y}$ in X' covering the initial edge $\Delta^1 \subseteq \Delta^1 \star K_\alpha$. Since e is q-coCartesian, we can extend

小红书
小红书号:3189205503 qq

s to a map $s' : \{x\} \star \{y\} \star \{z\} \star K_\alpha \to X'$ carrying $\{x\} \star \{y\}$ to e. It follows from Proposition HTT.2.4.1.7 that, for every vertex k of K_α, s' carries the edge $\{y\} \star \{k\}$ to a q-coCartesian edge of X'. Using the fact that $\overline{X}$ is $\mathfrak{P}$-fibered, we deduce that $s'|\{y\} \star K_\alpha$ and $s'|\{z\} \star K_\alpha$ are q-limit diagrams, so that s' carries $\{y\} \star \{z\}$ to an equivalence in X'_y. It follows that s carries the edge $\{x\} \star \{z\}$ into a composition of q-coCartesian edges $s'(\{x\} \star \{y\})$ and $s'(\{y\} \star \{z\})$, which is again a q-coCartesian edge (Proposition HTT.2.4.1.7). $\square$

We conclude this section with a few miscellaneous results concerning $\mathfrak{P}$-anodyne morphisms which will be needed later.

Lemma B.1.13. Let $\mathcal{P}_0$ denote the categorical pattern $(\Delta^0, \mathrm{Hom}_{\mathcal{S}\mathrm{et}_\Delta}(\Delta^1, \Delta^0), \mathrm{Hom}_{\mathcal{S}\mathrm{et}_\Delta}(\Delta^2, \Delta^0), \emptyset)$, so that $(\mathcal{S}et^+_\Delta)_{/\mathfrak{P}_0}$ is equivalent to $\mathcal{S}\mathrm{et}^+_\Delta$. For every left anodyne inclusion of simplicial sets $A \subseteq B$, the induced map $j : A^\sharp \subseteq B^\sharp$ is $\mathcal{P}_0$-anodyne.

Proof. Without loss of generality, we may assume that $B = \Delta^n$ and $A = \Lambda^n_i$, for some $0 \leq i < n$, where $n > 0$. Suppose first that $n > 2$. If $0 < i < n$, then j is a pushout of the inclusion $j_0 : (\Lambda^n_i)^\flat \to (\Delta^n)^\flat$, and therefore $\mathcal{P}_0$-anodyne (case (C_1) of Definition B.1.1). If $i = 0$, then j is a pushout of the inclusion

$$j_0 : (\Lambda^n_0)^\flat \coprod_{(\Delta^{\{0,1\}})^\flat} (\Delta^{\{0,1\}})^\sharp \to (\Delta^n)^\flat \coprod_{(\Delta^{\{0,1\}})^\flat} (\Delta^{\{0,1\}})^\sharp$$

which is $\mathcal{P}_0$-anodyne (case (C_0) of Definition B.1.1).

Now suppose that $n = 2$. We observe that j can be obtained as a composite $j'' \circ j'$, where j' is a pushout of the morphism j_0 considered above, and j'' is either a generating $\mathfrak{P}$-anodyne morphism of type (A_0) or the $\mathfrak{P}$-anodyne morphism described in Lemma B.1.11.

Finally, in the case $n = 1$, j is itself a morphism of type (B_0) appearing in Definition B.1.1. $\square$

Proposition B.1.14. Let $\mathfrak{P}$ be a categorical pattern on a simplicial set S. Let $f : \overline{X} \to \overline{Y}$ be a cofibration in $(\mathcal{S}et^+_\Delta)_{/\mathfrak{P}}$, and let $\overline{Z}$ be a $\mathfrak{P}$-fibered object of $(\mathcal{S}et^+_\Delta)_{/\mathfrak{P}}$. Then the induced map

$$q : \mathrm{Map}^\sharp_S(\overline{Y}, \overline{Z}) \to \mathrm{Map}^\sharp_S(\overline{X}, \overline{Z})$$

is a Kan fibration between Kan complexes. If f is $\mathfrak{P}_0$-anodyne (where $\mathfrak{P}_0$ is defined as in Lemma B.1.13), then q is a trivial Kan fibration.

Proof. We first show that q is a left fibration by showing that q has the right lifting property with respect to every left anodyne inclusion of simplicial sets $A \subseteq B$ (or *every* inclusion of simplicial sets, in the case where f is $\mathfrak{P}$-anodyne). Unwinding the definitions, this is equivalent to the assertion that $\overline{Z}$ has the extension property with respect to the induced inclusion

$$f' : (B^\sharp \times \overline{X}) \coprod_{A^\sharp \times \overline{X}} (A^\sharp \times \overline{Y}) \to B^\sharp \times \overline{Y}.$$

小红书
小红书号:3189205503 qq

It follows from Proposition B.1.9 and Lemma B.1.13 that f' is $\mathfrak{P}$-anodyne, so that the desired result is a consequence of Proposition B.1.6.

Applying the above result to the inclusion $\emptyset \subseteq \overline{X}$, we deduce that the projection map $\mathrm{Map}^{\sharp}_S(\overline{X}, \overline{Z}) \to \Delta^0$ is a left fibration, so that $\mathrm{Map}^{\sharp}_S(\overline{X}, \overline{Z})$ is a Kan complex. It follows that q is a Kan fibration as desired (Lemma HTT.2.1.3.3). □

B.2 The Model Structure on $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$

Our first main goal in this section is to prove Theorem B.0.20. Fix a categorical pattern $\mathfrak{P}$ on a simplicial set S. We wish to construct a model structure on the category $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$ such that the fibrant objects are precisely the $\mathfrak{P}$-fibered objects of $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$. Our first step will be to describe the class of weak equivalences in $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$.

Definition B.2.1. Let $\mathfrak{P}$ be a categorical pattern on a simplicial set S. We will say that a morphism $f : \overline{X} \to \overline{Y}$ in $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$ is a $\mathfrak{P}$-*equivalence* if, for every $\mathfrak{P}$-fibered object $\overline{Z} \in (\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$, the induced map

$$\mathrm{Map}^{\sharp}_S(\overline{Y}, \overline{Z}) \to \mathrm{Map}^{\sharp}_S(\overline{X}, \overline{Z})$$

is a homotopy equivalence of Kan complexes.

Example B.2.2. Any $\mathfrak{P}$-anodyne morphism is a $\mathfrak{P}$-equivalence; this follows immediately from Proposition B.1.14.

We now establish some properties of $\mathfrak{P}$-equivalences.

Lemma B.2.3. Let $\mathfrak{P}$ be a categorical pattern on a simplicial set S, and suppose we are given a pushout diagram

$$\begin{array}{ccc} \overline{X} & \xrightarrow{f} & \overline{Y} \\ \downarrow & & \downarrow \\ \overline{X}' & \xrightarrow{f'} & \overline{Y}' \end{array}$$

in $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$. Assume that the vertical maps are cofibrations. If f is a $\mathfrak{P}$-equivalence, then f' is a $\mathfrak{P}$-equivalence.

Proof. Let $\overline{Z} \in (\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$ be $\mathfrak{P}$-fibered. We have a pullback diagram of simplicial sets

$$\begin{array}{ccc} \mathrm{Map}^{\sharp}_S(\overline{X}, \overline{Z}) & \longleftarrow & \mathrm{Map}^{\sharp}_S(\overline{Y}, \overline{Z}) \\ \uparrow & & \uparrow \\ \mathrm{Map}^{\sharp}_S(\overline{X}', \overline{Z}) & \longleftarrow & \mathrm{Map}^{\sharp}_S(\overline{Y}', \overline{Z}) \end{array}$$

小红书 小红书号:3189205503 qq

Proposition B.1.14 implies that the vertical maps are Kan fibrations, so that the diagram is also a homotopy pullback square. Since f is a $\mathfrak{P}$-equivalence, the upper horizontal maps is a homotopy equivalence of Kan complexes. It follows that the lower horizontal map is also a homotopy equivalence of Kan complexes, as desired. □

Lemma B.2.4. Let $\mathfrak{P} = (M_S, T, \{p_\alpha : K_\alpha^{\triangleleft} \to S\}_{\alpha \in A})$ be a categorical pattern on a simplicial set S, and let $f : \overline{X} \to \overline{Y}$ be a map between $\mathfrak{P}$-fibered objects $\overline{X} = (X, M), \overline{Y} = (Y, M')$ of $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$. The following conditions are equivalent:

(1) The map f is a $\mathfrak{P}$-equivalence.

(2) The map f admits a homotopy inverse; that is, there exists a map $g : \overline{Y} \to \overline{X}$ in $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$ and homotopies
$$h : (\Delta^1)^{\sharp} \times \overline{X} \to \overline{X} \qquad h' : (\Delta^1)^{\sharp} \times \overline{Y} \to \overline{Y}$$
connecting $g \circ f$ and $f \circ g$ to $\mathrm{id}_{\overline{X}}$ and $\mathrm{id}_{\overline{Y}}$, respectively.

(3) For every edge $\Delta^1 \to S$, the induced map $X \times_S \Delta^1 \to Y \times_S \Delta^1$ is an equivalence of ∞-categories.

If every edge of S belongs to M_S, then (3) can be replaced by the following apparently weaker condition:

(3′) For every vertex $s \in S$, the induced map $X_s \to Y_s$ is an equivalence of ∞-categories.

Proof. The equivalence of (1) and (2) is formal, and the implications (2) ⇒ (3) ⇒ (3′) are clear. If every edge of S belongs to M_S, then the implication (3′) ⇒ (3) follows from Corollary HTT.2.4.4.4. To complete the proof, let us suppose that f satisfies (3). We will say that an object $\overline{W} = (W, M'') \in (\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$ is *good* if composition with f induces a homotopy equivalence
$$\mathrm{Map}^{\sharp}_S(\overline{W}, \overline{X}) \to \mathrm{Map}^{\sharp}_S(\overline{W}, \overline{Y}).$$
Our goal is to prove that every object $\overline{W} \in (\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$ is good. The proof proceeds in several steps:

(a) We have a commutative diagram
$$\begin{array}{ccc} \mathrm{Map}^{\sharp}_S(\overline{W}, \overline{X}) & \longrightarrow & \mathrm{Map}^{\sharp}_S(\overline{W}, \overline{Y}) \\ \downarrow & & \downarrow \\ \mathrm{Map}^{\sharp}_S(W^{\flat}, \overline{X}) & \longrightarrow & \mathrm{Map}^{\sharp}_S(W^{\flat}, \overline{Y}). \end{array}$$
The left vertical map exhibits $\mathrm{Map}^{\sharp}_S(\overline{W}, \overline{X})$ as the full simplicial subset of $\mathrm{Map}^{\sharp}_S(W^{\flat}, \overline{X})$ spanned by those maps $W \to X$ which carry every edge in M'' to a locally p-coCartesian

小红书
小红书号:3189205503 qq

edge of X, where $p : X \to S$ denotes the projection, and the right vertical map admits a similar description in terms of the projection $q : Y \to S$. Assumption (3) implies that an edge of X is locally p-coCartesian if and only if its image in Y is locally q-coCartesian. Consequently, to prove that $\overline{W}$ is good, it will suffice to show that $W^\flat$ is good.

(b) Suppose given a pushout diagram

$$\begin{array}{ccc} V & \longrightarrow & V' \\ \downarrow & & \downarrow \\ W & \longrightarrow & W' \end{array}$$

in the category of simplicial sets over S, where the vertical maps are cofibrations. We then obtain pullback diagram

$$\begin{array}{ccc} \mathrm{Map}^\sharp_S(V^\flat, \overline{X}) & \longleftarrow & \mathrm{Map}^\sharp_S(V'^\flat, \overline{X}) \\ \uparrow & & \uparrow \\ \mathrm{Map}^\sharp_S(W^\flat, \overline{X}) & \longleftarrow & \mathrm{Map}^\sharp_S(W'^\flat, \overline{X}) \end{array} \qquad \begin{array}{ccc} \mathrm{Map}^\sharp_S(V^\flat, \overline{Y}) & \longleftarrow & \mathrm{Map}^\sharp_S(V'^\flat, \overline{Y}) \\ \uparrow & & \uparrow \\ \mathrm{Map}^\sharp_S(W^\flat, \overline{Y}) & \longleftarrow & \mathrm{Map}^\sharp_S(W'^\flat, \overline{Y}) \end{array}$$

Proposition B.1.14 implies that the vertical maps are Kan fibrations, so both diagrams are homotopy pullback squares. It follows that if $V^\flat$, $V'^\flat$, and $W^\flat$ are good, then $W'^\flat$ is good.

(c) Let $\Delta^n \to S$ be a map; then $(\Delta^n)^\flat$ is good for $n \leq 1$; this follows immediately from (3).

(d) For any map $\Delta^n \to S$, the object $(\Delta^{\{0,1\}} \coprod_{\{0\}} \cdots \coprod_{\{n-1\}} \Delta^{\{n-1,n\}})^\flat \in (\mathcal{S}et^+_\Delta)_{/\mathfrak{P}}$ is good; this follows from (b) and (c).

(e) Let $u : \overline{W} \to \overline{W}'$ be a $\mathfrak{P}$-equivalence (for example, any $\mathfrak{P}$-anodyne map). Then $\overline{W}$ is good if and only if $\overline{W}'$ is good.

(f) For any map $\Delta^n \to S$, the resulting object $(\Delta^n)^\flat \in (\mathcal{S}et^+_\Delta)_{/\mathfrak{P}}$ is good. This follows from (e) and (d), since the inclusion $(\Delta^{\{0,1\}} \coprod_{\{0\}} \cdots \coprod_{\{n-1\}} \Delta^{\{n-1,n\}})^\flat \subseteq (\Delta^n)^\flat$ is $\mathfrak{P}$-anodyne (Example B.2.2).

(g) The collection of good objects in $(\mathcal{S}et^+_\Delta)_{/\mathfrak{P}}$ is closed under coproducts (since a product of homotopy equivalences between Kan complexes is again a homotopy equivalence).

(h) If the simplicial set W is finite-dimensional, then $W^\flat \in (\mathcal{S}et^+_\Delta)_{/\mathfrak{P}}$ is good. The proof goes by induction on the dimension $n \geq 0$ of W. If W is empty, then the result is obvious. Otherwise, let K denote the set of nondegenerate n-simplices of W, and let W' denote the $(n-1)$-skeleton of W. We have a pushout diagram

$$\begin{array}{ccc} K \times \partial\, \Delta^n & \longrightarrow & W' \\ \downarrow & & \downarrow \\ K \times \Delta^n & \longrightarrow & W. \end{array}$$

小红书
小红书号:3189205503 qq

The inductive hypothesis guarantees that $(K \times \partial\, \Delta^n)^\flat$ and $W'^\flat$ are good, and $(K \times \Delta^n)^\flat$ is good by virtue of (g) and (f). It follows from (b) that $W^\flat$ is good.

(i) Suppose that W is obtained as the direct limit of a sequence of inclusions

$$W(0) \to W(1) \to W(2) \to \dots$$

Then $\mathrm{Map}^{\sharp}_S(W^\flat, \overline{X})$ can be obtained as the homotopy inverse limit of the tower $\{\mathrm{Map}^{\sharp}_S(W(n)^\flat, \overline{X})\}_{n \geq 0}$, and $\mathrm{Map}^{\sharp}_S(W^\flat, \overline{Y})$ can be described similarly. It follows that if each $W(n)^\flat$ is good, then $W^\flat$ is good.

(j) For every map of simplicial sets $W \to S$, the object $W^\flat \in (\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$ is good. This follows from (h) and (i), if we take $W(n)$ to be the n-skeleton of W.

□

We now come to the proof of our main result:

Proof of Theorem B.0.20. Let $\mathfrak{P} = (M_S, T, \{p_\alpha : K_\alpha^{\triangleleft} \to S\}_{\alpha \in A})$ be a categorical pattern on a simplicial set S. We wish to prove that the category $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$ admits a combinatorial simplicial model structure in which the cofibrations are given by monomorphisms and the fibrant objects are precisely the $\mathfrak{P}$-fibered objects. Assume for the moment that each of the simplicial sets K_α is finite. It follows from the small object argument that there exists a functor $E : (\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}} \to (\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$ and a natural transformation $\alpha : \mathrm{id} \to T$ with the following properties:

(a) The functor E commutes with filtered colimits.

(b) For every object $\overline{X} \in (\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$, the object $E\overline{X} \in (\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$ has the extension property with respect to every $\mathfrak{P}$-anodyne map (and is therefore $\mathfrak{P}$-fibered, by virtue of Proposition B.1.6.

(c) For every object $\overline{X} \in (\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$, the map $\overline{X} \to E\overline{X}$ is $\mathfrak{P}$-anodyne.

Let $f : \overline{X} \to \overline{Y}$ be a morphism in $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$. It follows from (c) and Example B.2.2 that f is a $\mathfrak{P}$-equivalence if and only if $E(f)$ is a $\mathfrak{P}$-equivalence. Using (b) and Lemma B.2.4, we deduce that f is an equivalence if and only if for each edge $e : \Delta^1 \to S$, the map $E(f)$ induces a categorical equivalence of simplicial sets after pulling back along e. Using (a) and Corollary HTT.A.2.6.14 , we deduce that the collection of $\mathfrak{P}$-equivalences in $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$ is perfect, in the sense of Definition HTT.A.2.6.12 .

We now wish to deduce the existence of a left proper, combinatorial model structure on $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$ such that the cofibrations are the monomorphisms and the weak equivalences are given by the $\mathfrak{P}$-equivalences. It will suffice to show that $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$ satisfies the hypotheses of Proposition HTT.A.2.6.15 :

小红书
小红书号:3189205503 qq

(1) The collection of $\mathfrak{P}$-equivalences is perfect: this follows from the above arguments.

(2) The collection of $\mathfrak{P}$-equivalences is stable under pushouts by cofibrations: this follows from Lemma B.2.3.

(3) Let $f : \overline{X} \to \overline{Y}$ be a morphism in $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$ which has the right lifting property with respect to every cofibration; we wish to show that f is a $\mathfrak{P}$-equivalence. To prove this, it suffices to observe that f admits a section s and that the composition $s \circ f : \overline{X} \to \overline{X}$ is homotopic to the identity (that is, there exists a homotopy $h : \overline{X} \times (\Delta^1)^{\sharp} \to \overline{X}$ from $\mathrm{id}_{\overline{X}}$ to $s \circ f$ in the category $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$).

We next claim that the simplicial structure on $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$ is compatible with its model structure. In view of Proposition HTT.A.3.1.7 , it will suffice to prove that for every object $\overline{X} \in (\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$ and each $n \geq 0$, the projection map $p : \overline{X} \times (\Delta^n)^{\sharp} \to \overline{X}$ is a $\mathfrak{P}$-equivalence. The inclusion $i : \{0\}^{\sharp} \subseteq (\Delta^n)^{\sharp}$ determines a section s of p; it will therefore suffice to show that s is a $\mathfrak{P}$-equivalence. Lemma B.1.13 implies that i is $\mathfrak{P}_0$-anodyne (where $\mathfrak{P}_0$ is defined as in the statement of Lemma B.1.13). Using Proposition B.1.9, we conclude that s is $\mathfrak{P}$-anodyne, so that s is a $\mathfrak{P}$-equivalence by Example B.2.2.

We now discuss the case of a general categorical pattern $\mathfrak{P} = (M_S, T, \{p_\alpha : K_\alpha^{\triangleleft} \to S'\}_{\alpha \in A})$ on S. Let $\mathfrak{P}' = (M_S, T, \emptyset)$. We have already shown that $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}'}$ has the structure of a left proper combinatorial simplicial model category. We may therefore define a model structure on the category $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$ to be the localization of $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$ with respect to the generating $\mathfrak{P}$-anodyne maps appearing in Definition B.1.1. It follows from Proposition HTT.A.3.7.3 that $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$ is again a left proper combinatorial simplicial model category.

To complete the proof, it will suffice to show that an object $\overline{X} \in (\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$ is fibrant if and only if it is $\mathfrak{P}$-fibered. It follows from Proposition HTT.A.3.7.3 that $\overline{X}$ is fibrant if and only if the following conditions are satisfied:

(i) The object $\overline{X}$ is fibrant in $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}'}$: that is, $\overline{X}$ has the extension property with respect to every cofibration $f : \overline{Y} \to \overline{Y}'$ which is a $\mathfrak{P}'$-equivalence.

(ii) For every generating $\mathfrak{P}$-anodyne map $f : \overline{Y} \to \overline{Y}'$, the induced map $q : \mathrm{Map}^{\sharp}_S(\overline{Y}', \overline{X}) \to \mathrm{Map}^{\sharp}_S(\overline{Y}, \overline{X})$ is a homotopy equivalence of Kan complexes.

Suppose that $\overline{X}$ satisfies (ii). Note that for every $\mathfrak{P}$-anodyne map f, the map q is a Kan fibration (Proposition B.1.14), and therefore a trivial Kan fibration. It follows that q is surjective on vertices, so that $\overline{X}$ has the extension property with respect to every $\mathfrak{P}$-anodyne map and is therefore $\mathfrak{P}$-fibered by virtue of Proposition B.1.6.

Conversely, suppose that $\overline{X}$ is $\mathfrak{P}$-fibered; we wish to show that $\overline{X}$ satisfies conditions (i) and (ii). To prove (i), consider the map $q : \mathrm{Map}^{\sharp}_S(\overline{Y}', \overline{X}) \to \mathrm{Map}^{\sharp}_S(\overline{Y}, \overline{X})$. This map is a Kan fibration (Proposition B.1.14) and a homotopy equivalence by virtue of our assumption that f is a $\mathfrak{P}'$-equivalence (since $\overline{X}$ is $\mathfrak{P}'$-fibered). It follows that q is a trivial Kan fibration and therefore

小红书
小红书号:3189205503 qq

surjective on vertices, which proves (i). To prove (ii), it will suffice to show that q is a trivial Kan fibration whenever f is $\mathfrak{P}$-anodyne. To see that q has the right lifting property with respect to the inclusion $\partial \Delta^n \subseteq \Delta^n$, we need to show that $\overline{X}$ has the extension property with respect to the induced inclusion

$$f' = (\overline{Y} \times (\Delta^n)^\sharp) \coprod_{\overline{Y} \times (\partial \Delta^n)^\sharp} (\overline{Y}' \times (\partial \Delta^n)^\sharp) \subseteq \overline{Y}' \times (\Delta^n)^\sharp.$$

This follows from Proposition B.1.6, since f' is $\mathfrak{P}$-anodyne by virtue of Proposition B.1.9. □

Remark B.2.5. Let $\mathfrak{P}$ and $\mathfrak{P}'$ be categorical patterns, and let $\mathfrak{P} \times \mathfrak{P}'$ be defined as in Definition B.1.8. The formation of Cartesian products induces a functor

$$F : (\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}} \times (\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}'} \to (\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P} \times \mathfrak{P}'}.$$

With respect to the model structures of Theorem B.0.20, the map F is a left Quillen bifunctor. To prove this, we must show that if $f : \overline{X} \to \overline{X}'$ is a cofibration in $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$ and $g : \overline{Y} \to \overline{Y}'$ is a cofibration in $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}'}$, then the induced map

$$f \wedge g : (\overline{X}' \times \overline{Y}) \coprod_{\overline{X} \times \overline{Y}} (\overline{X} \times \overline{Y}') \to \overline{X}' \times \overline{Y}'$$

is a cofibration, which is trivial if either f or g is trivial. The first claim is obvious, and the second is equivalent to the requirement that the diagram

$$\begin{array}{ccc} \overline{X} \times \overline{Y} & \xrightarrow{i} & \overline{X}' \times \overline{Y} \\ \downarrow & & \downarrow \\ \overline{X} \times \overline{Y}' & \xrightarrow{j} & \overline{X}' \times \overline{Y}' \end{array}$$

is a homotopy pushout square. For this, it suffices to show that the horizontal maps are weak equivalences. We will prove that i is a weak equivalence; the proof that j is a weak equivalence is similar. Choose a $\mathfrak{P}$-anodyne map $f' : \overline{X}' \to \overline{X}''$, where $\overline{X}''$ is $\mathfrak{P}$-fibered. Proposition B.1.9 guarantees that the map $\overline{X}' \times \overline{Y} \to \overline{X}'' \to \overline{Y}$ is $(\mathfrak{P} \times \mathfrak{P}')$-anodyne. It therefore suffices to show that the composite map $\overline{X} \times \overline{Y} \to \overline{X}'' \times \overline{Y}$ is a $(\mathfrak{P} \times \mathfrak{P}')$-equivalence. We may therefore replace $\overline{X}'$ by $\overline{X}''$ and thereby reduce to the case where $\overline{X}'$ is $\mathfrak{P}$-fibered. By a similar argument, we can assume that the map $\overline{X} \to \overline{X}'$ has the right lifting property with respect to all $\mathfrak{P}$-anodyne morphisms, so that $\overline{X}$ is $\mathfrak{P}$-fibered as well. The $\mathfrak{P}$-equivalence f now admits a homotopy inverse, so that the induced map $\overline{X} \times \overline{Y} \to \overline{X}' \times \overline{Y}$ admits a homotopy inverse as well.

Remark B.2.6. Let $\mathfrak{P}$ be a categorical pattern, and let $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$ be endowed with the model structure of Theorem B.0.20. Then the weak equivalences in $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$ are precisely the $\mathfrak{P}$-equivalences.

小红书
小红书号:3189205503 qq

Let $\mathfrak{P}$ be a categorical pattern on a simplicial set S, and regard $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$ as endowed with the model structure of Theorem B.0.20. An object of $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$ is fibrant if and only if it is $\mathfrak{P}$-fibered. Under some mild assumptions on $\mathfrak{P}$, we can explicitly describe all *fibrations* between fibrant objects of $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$:

Proposition B.2.7. Let $\mathfrak{P} = (M_S, T, \{p_\alpha : K_\alpha^{\triangleleft} \to S\}_{\alpha \in A})$ be a categorical pattern on an ∞-category S. Suppose that M_S contains all equivalences in S and that T contains all 2-simplices $\Delta^2 \to S$ whose restriction to $\Delta^{\{0,1\}}$ in an equivalence in S. Let $\overline{Y} = (Y, M_Y)$ be a $\mathfrak{P}$-fibered object of $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$, and let $\pi : Y \to S$ denote the underlying map of simplicial sets. Let $\overline{X} = (X, M_X)$ be another object of $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$, and let $f : \overline{X} \to \overline{Y}$ be a morphism. The following conditions are equivalent:

(a) The map p is a fibration in $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$.

(b) The object $\overline{X}$ is $\mathfrak{P}$-fibered, and the underlying map of simplicial sets $X \to Y$ is a categorical fibration.

(c) The map p exhibits $\overline{X}$ as a $\pi^* \mathfrak{P}$-fibered object of $(\mathcal{S}et^{+}_{\Delta})_{/\pi^* \mathfrak{P}}$.

The proof of Proposition B.2.7 will require some preliminaries. We begin with some remarks on the functoriality of the construction $\mathfrak{P} \mapsto (\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$ (for a generalization, see Theorem B.4.2).

Definition B.2.8. Let $f : S \to S'$ be a map of simplicial sets. Suppose we are given categorical patterns $\mathfrak{P} = (M_S, T, \{p_\alpha : K_\alpha^{\triangleleft} \to S\}_{\alpha \in A})$ and $\mathfrak{P}' = (M'_S, T', \{p'_\alpha : {K'_\alpha}^{\triangleleft} \to S'\}_{\alpha \in A'})$ on S and S', respectively. We will say that f is *compatible* with $\mathfrak{P}$ and $\mathfrak{P}'$ if the following conditions are satisfied:

- The map f carries M_S into $M_{S'}$.
- The map f carries T into T'.
- For each $\alpha \in A$, the composition
$$K_\alpha^{\triangleleft} \xrightarrow{p_\alpha} S \xrightarrow{f} S'$$
belongs to $\{p'_\alpha : {K'_\alpha}^{\triangleleft} \to S'\}_{\alpha \in A'})$.

Proposition B.2.9. Let $f : S \to S'$ be a map of simplicial sets, and suppose that f is compatible with categorical patterns $\mathfrak{P}$ and $\mathfrak{P}'$ on S and S', respectively. Then composition with f induces a left Quillen functor $f_! : (\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}} \to (\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}'}$.

Proof. It is clear that $f_!$ preserves cofibrations. It also admits a right adjoint, given by the pullback functor f^* described by the formula $f^* \overline{X} \simeq \overline{X} \times_{(S', M_{S'})} (S, M_S)$. To complete the proof, it will suffice to show that $f_!$ preserves $\mathfrak{P}$-equivalences. Let $\overline{X}, \overline{Y} \in (\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$, and let $\alpha : \overline{X} \to \overline{Y}$ be a

小红书
小红书号:3189205503 qq

$\mathfrak{P}$-equivalence. We wish to show that $f_!(\alpha)$ is a $\mathfrak{P}'$-equivalence. For this, it suffices to show that for every $\mathfrak{P}'$-fibered object $\overline{Z} \in (\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}'}$, the induced map

$$\mathrm{Map}^{\sharp}_{S'}(f_!\overline{Y}, \overline{Z}) \to \mathrm{Map}^{\sharp}_{S'}(f_!\overline{X}, \overline{Z})$$

is a homotopy equivalence. The left hand side can be identified with $\mathrm{Map}^{\sharp}_{S}(\overline{Y}, f^*\overline{Z})$, and the right hand side with $\mathrm{Map}^{\sharp}_{S}(\overline{X}, f^*\overline{Z})$. The desired result now follows from the assumption that α is a $\mathfrak{P}$-equivalence, and the observation that $f^*\overline{Z}$ is $\mathfrak{P}$-fibered. □

Example B.2.10. For any categorical pattern $\mathfrak{P} = (M_S, T, \{p_\alpha : K_\alpha^{\triangleleft} \to S\}_{\alpha \in A})$ on any simplicial set S, the forgetful functor $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}} \to \mathcal{S}\mathrm{et}^{+}_{\Delta}$ is a left Quillen functor, where we endow $\mathcal{S}\mathrm{et}^{+}_{\Delta}$ with the model structure determined by Theorem B.0.20 for the categorical pattern $\mathfrak{P}_0 = (M_0, T_0, \{K_\alpha^{\triangleleft} \to \Delta^0\}_{\alpha \in A})$ on Δ^0 (here M_0 and T_0 consist of all edges and 2-simplices of Δ^0, respectively). If each of the simplicial sets K_α is contractible, then this coincides with the usual model structure on $\mathcal{S}\mathrm{et}^{+}_{\Delta}$ (Remark B.0.28).

Lemma B.2.11. Let $\mathfrak{P} = (M_S, T, \{p_\alpha : K_\alpha^{\triangleleft} \to S\}_{\alpha \in A})$ be a categorical pattern on an ∞-category S, and let $\overline{X} = (X, M) \in (\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$ be $\mathfrak{P}$-fibered. Assume that M_S is the collection of all equivalences in S and that T contains all 2-simplices $\Delta^2 \to S$ whose restriction to $\Delta^{\{0,1\}}$ in an equivalence in S. Then M is the collection of all equivalences in X.

Proof. Let $p : X \to S$ denote the underlying map of simplicial sets. The set M consists of all locally p-coCartesian morphisms f in X such that $p(f)$ is an equivalence in S. In view of Proposition HTT.2.4.1.5 , it will suffice to show that every such morphism is p-coCartesian. This follows from Lemma B.1.7 together with our assumption on the set of 2-simplices T. □

Proof of Proposition B.2.7. Fix a categorical pattern $\mathfrak{P} = (M_S, T, \{p_\alpha : K_\alpha^{\triangleleft} \to S\}_{\alpha \in A})$ on an ∞-category S, where M_S contains all equivalences in S and T contains all 2-simplices $\Delta^2 \to S$ whose restriction to $\Delta^{\{0,1\}}$ in an equivalence in S. Let $p : \overline{X} \to \overline{Y}$ be a morphism in $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$, where $\overline{Y}$ is $\mathfrak{P}$-fibered. We wish to prove that conditions (a), (b) and (c) of Proposition B.2.7 are equivalent.

We first prove that $(a) \Rightarrow (b)$. Assume that p is a fibration in $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$: we wish to prove that $\overline{X}$ is $\mathfrak{P}$-fibered and that the underlying map of simplicial sets $X \to Y$ is a categorical fibration. The first assertion is obvious; to prove the second, we must show that every lifting problem of the form

$$\begin{array}{ccc} A^{\flat} & \longrightarrow & \overline{X} \\ \downarrow{\scriptstyle i} & \nearrow & \downarrow \\ B^{\flat} & \longrightarrow & \overline{Y} \end{array}$$

admits a solution, provided that the underlying map of simplicial sets $A \to B$ is a trivial cofibration with respect to the Joyal model structure. To prove this, it will suffice to show that the map i is a $\mathfrak{P}$-equivalence. By virtue of Proposition B.2.9, it will suffice to prove this after replacing $\mathfrak{P}$

小红书
小红书号:3189205503 qq

by the categorical pattern $\mathfrak{P}' = (M'_S, T, \emptyset)$, where M'_S is the collection of all equivalences in S. We must now show that for every $\mathfrak{P}$-fibered object $\overline{Z} = (Z, M) \in (\mathcal{S}et^+_\Delta)_{/\mathfrak{P}}$, the induced map $\theta : \mathrm{Map}^\sharp_S(B^\flat, \overline{Z}) \to \mathrm{Map}^\sharp_S(A^\flat, \overline{Z})$ is a weak homotopy equivalence. We observe that Z is an ∞-category and M_Z can be identified with the collection of all equivalences in Z (Lemma B.2.11). For every simplicial set K and every ∞-category $\mathcal{C}$, we have a commutative diagram

$$\begin{array}{ccccc} \mathrm{Map}^\sharp_S(B^\flat, \overline{Z}) & \longrightarrow & \mathrm{Fun}(B, Z)^{\simeq} & \longrightarrow & \mathrm{Fun}(B, S)^0 \\ \downarrow{\scriptstyle \theta} & & \downarrow{\scriptstyle \theta'} & & \downarrow{\scriptstyle \theta''} \\ \mathrm{Map}^\sharp_S(A^\flat, \overline{Z}) & \longrightarrow & \mathrm{Fun}(A, Z)^0 & \longrightarrow & \mathrm{Fun}(A, S)^{\simeq}. \end{array}$$

where the rows are homotopy fiber sequences. Consequently, to prove that θ is a homotopy equivalence, it suffices to show that θ' and θ'' are homotopy equivalences. This follows from the observation that the maps

$$\mathrm{Fun}(B, Z) \to \mathrm{Fun}(A, Z) \qquad \mathrm{Fun}(B, S) \to \mathrm{Fun}(A, S)$$

are categorical equivalences (in fact, trivial Kan fibrations), since $A \to B$ is a trivial cofibration and the simplicial sets S and Z are fibrant (with respect to the Joyal model structure).

We now show that $(b) \Rightarrow (a)$. Assume that $\overline{X}$ is $\mathfrak{P}$-fibered and that the underlying map $X \to Y$ is a categorical fibration; we wish to show that $p : \overline{X} \to \overline{Y}$ is a fibration in $(\mathcal{S}et^+_\Delta)_{/\mathfrak{P}}$. We must prove that every lifting problem of the form

$$\begin{array}{ccc} \overline{A} & \xrightarrow{f_0} & \overline{X} \\ \downarrow{\scriptstyle i} & \nearrow & \downarrow{\scriptstyle p} \\ \overline{B} & \xrightarrow{g} & \overline{Y} \end{array}$$

admits a solution, provided that i is a monomorphism and a $\mathfrak{P}$-equivalence. Since $\overline{X}$ is $\mathfrak{P}$-fibered, the lifting problem

$$\begin{array}{ccc} \overline{A} & \xrightarrow{f_0} & \overline{X} \\ \downarrow{\scriptstyle i} & \nearrow_{f'} & \downarrow \\ \overline{B} & \longrightarrow & (S, M_S). \end{array}$$

admits a solution. The map $g' = p \circ f'$ does not necessarily coincide with g. However, g and g' agree on $\overline{A}$ and therefore determine a map

$$G_0 : (\overline{A} \times (\Delta^1)^\sharp) \coprod_{\overline{A} \times (\partial \Delta^1)^\sharp} (\overline{B} \times (\partial \Delta^1)^\sharp) \to \overline{Y}.$$

小红书
小红书号:3189205503 qq

Consider the diagram

$$\begin{array}{ccccc} (\overline{A} \times (\Delta^1)^\sharp) \coprod_{\overline{A} \times (\partial \Delta^1)^\sharp} (\overline{B} \times (\partial \Delta^1)^\sharp) & & \xrightarrow{G_0} & & \overline{Y} \\ \downarrow{\scriptstyle j} & & \overset{G}{\nearrow} & & \downarrow \\ \overline{B} \times (\Delta^1)^\sharp & & \xrightarrow{\quad} & \overline{B} \xrightarrow{\pi \circ g} & (S, M_S). \end{array}$$

Since the map j is a $\mathfrak{P}$-equivalence (Proposition B.1.9) and $\overline{X}$ is $\mathfrak{P}$-fibered, there exists a map G rendering this diagram commutative. We regard G as an equivalence from g to $p \circ f'$ in $\mathrm{Fun}(B, Y)$. Since p is a categorical fibration, it induces a fibration $X^\natural \to Y^\natural$ in the category of marked simplicial sets; here $X^\natural = (X, E_X)$ where E_X is the collection of all equivalences in X and $Y^\natural$ is defined similarly. It follows that the lifting problem

$$\begin{array}{ccccc} (A^\flat \times (\Delta^1)^\sharp) \coprod_{A^\flat \times \{1\}^\sharp} (B^\flat \times \{1\}^\sharp) & \longrightarrow & A^\flat & \xrightarrow{f'} & X^\natural \\ \downarrow & & \overset{F}{\nearrow} & & \downarrow \\ B^\flat \times (\Delta^1)^\sharp & & \xrightarrow{G} & & Y^\natural \end{array}$$

admits a solution. We can regard F as an equivalence from f to f' in $\mathrm{Fun}(B, X)$, where f is an extension of f_0 lifting g. Since f is equivalent to f', it carries marked edges of $\overline{A}$ to marked edges of $\overline{X}$, and therefore constitutes a solution to the original lifting problem.

We next show that $(a) \Rightarrow (c)$. Assume that f is a fibration in $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$. We must prove that every lifting problem of the form

$$\begin{array}{ccc} \overline{A} & \xrightarrow{f_0} & \overline{X} \\ \downarrow{\scriptstyle i} & \nearrow & \downarrow{\scriptstyle p} \\ \overline{B} & \xrightarrow{g} & \overline{Y} \end{array}$$

admits a solution, provided that i is a trivial cofibration in $(\mathcal{S}et^{+}_{\Delta})_{/\pi^* \mathfrak{P}}$; here π denotes the projection $Y \to S$. Since p is assumed to be a fibration in $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$, it suffices to show that i is a trivial cofibration in $(\mathcal{S}et^{+}_{\Delta})_{/\mathfrak{P}}$, which follows from Proposition B.2.9.

Finally, we show that $(c) \Rightarrow (b)$. Assume that $\overline{X}$ is $(\pi^* \mathfrak{P})$-fibrered. Replacing $\mathfrak{P}$ by $\pi^* \mathfrak{P}$ and invoking the implication $(a) \Rightarrow (b)$, we deduce that $X \to Y$ is a categorical fibration. It will therefore suffice to show that $\overline{X}$ is $\mathfrak{P}$-fibered. We will show that $\overline{X}$ satisfies conditions (1), (2), (3), (4), and (6) of Definition B.0.19, together with condition $(5')$ of Remark B.0.26:

(1) The underlying map of simplicial sets $q : X \to S$ is an inner fibration. This is clear, since $q = \pi \circ p$, where both π and p are inner fibrations.

(2) For each edge $\Delta^1 \to S$ belonging to M_S, the induced map $q_{\Delta^1} : X \times_S \Delta^1 \to \Delta^1$ is a coCartesian fibration. In other words, we must show that for every object $x \in X$ and every

小红书 小红书号:3189205503 qq

edge $e : q(x) \to s$ belonging to M_S, there exists a locally q-coCartesian edge $\overline{e} : x \to \overline{s}$ with $q(\overline{e}) = e$. Since $\overline{Y}$ is $\mathfrak{P}$-fibered, we can choose a locally π-coCartesian edge $\widetilde{e} : p(x) \to \widetilde{s}$ with $\pi(\widetilde{e}) = e$. Moreover, the edge $\widetilde{e}$ belongs to M_Y, so we can choose a locally p-coCartesian edge $\overline{e}$ with $p(\overline{e}) = \widetilde{e}$ (note that $\overline{e}$ belongs to M_X). To complete the proof, it will suffice to show that $\overline{e}$ is locally q-coCartesian: in other words, that it determines a q_{Δ^1}-coCartesian edge $\overline{e}'$ of $X \times_S \Delta^1$. We note that q_{Δ^1} factors as a composition

$$X \times_S \Delta^1 \xrightarrow{q'_{\Delta^1}} Y \times_S \Delta^1 \xrightarrow{\pi_{\Delta^1}} \Delta^1,$$

and that $q'_{\Delta^1}(\overline{e}')$ is π_{Δ^1}-coCartesian by construction. In view of Proposition HTT.2.4.1.3 , it suffices to show that $\overline{e}'$ is q'_{Δ^1}-coCartesian. This follows from Lemma B.1.7, since the image of every 2-simplex σ of $X \times_S \Delta^1$ in Y is a thin 2-simplex with respect to $\pi^* \mathfrak{P}$ (since the image of σ in S is degenerate).

(3) An edge $\overline{e} : x \to x'$ of X belongs to M_X if and only if $e = q(\overline{e})$ belongs to M_S and e locally q-coCartesian. The "if" direction follows from the proof of (2). For the converse, we observe that if $e \in M_S$ then we can apply the construction of (2) to produce a locally q-coCartesian edge $\overline{e}' : x \to x''$ of X covering e, where $\overline{e}' \in M_X$. If $\overline{e}$ is also locally q-coCartesian, then $\overline{e}$ and $\overline{e}'$ are equivalent, so $\overline{e}$ also belongs to M_X.

(4) Given a commutative diagram

$$\begin{array}{ccc} \Delta^{\{0,1\}} & \xrightarrow{e} & X \\ \downarrow & & \downarrow \\ \Delta^2 & \xrightarrow{\sigma} & S, \end{array}$$

if $e \in M_X$ and $\sigma \in T$, then e determines an q_{Δ^2}-coCartesian edge of $X \times_S \Delta^2$, where $q_{\Delta^2} : X \times_S \Delta^2 \to \Delta^2$ denotes the projection map. To prove this, we factor q_{Δ^2} as a composition

$$X \times_S \Delta^2 \xrightarrow{p_{\Delta^2}} Y \times_S \Delta^2 \xrightarrow{\pi_{\Delta^2}} \Delta^2.$$

Since $\overline{Y}$ is $\mathfrak{P}$-fibered and $p(e) \in M_Y$, we conclude that the image of e in $Y \times_S \Delta^2$ is π_{Δ^2}-coCartesian. In view of Proposition HTT.2.4.1.3 , it will suffice to show that e determines a p_{Δ^2}-coCartesian edge of $X \times_S \Delta^2$. This follows from Lemma B.1.7, since e determines a locally p_{Δ^2}-coCartesian edge of $X \times_S \Delta^2$ and the image of every 2-simplex of $X \times_S \Delta^2$ in Y is thin with respect to $\pi^* \mathfrak{P}$.

(5′) For each $\alpha \in A$, every lifting problem of the form

$$\begin{array}{ccc} K_\alpha^\sharp & \longrightarrow & \overline{X} \\ \downarrow & \nearrow & \downarrow \\ (K_\alpha^\triangleleft)^\sharp & \xrightarrow{p_\alpha} & (S, M_S) \end{array}$$

小红书 小红书号:3189205503 qq

admits a solution. We first invoke the fact that $\overline{Y}$ is $\mathfrak{P}$-fibered to solve the induced lifting problem

$$\begin{array}{ccc} K_\alpha^\sharp & \longrightarrow & \overline{Y} \\ \downarrow & \overset{f}{\nearrow} & \downarrow \\ (K_\alpha^\triangleleft)^\sharp & \xrightarrow{p_\alpha} & (S, M_S). \end{array}$$

We then invoke the assumption that $\overline{X}$ is $\pi^* \mathfrak{P}$ fibered to solve the lifting problem

$$\begin{array}{ccc} K_\alpha^\sharp & \longrightarrow & \overline{X} \\ \downarrow & \overset{f}{\nearrow} & \downarrow \\ (K_\alpha^\triangleleft)^\sharp & \xrightarrow{f} & \overline{Y}. \end{array}$$

(6) For every index $\alpha \in A$, every map $\overline{p}_\alpha : (K_\alpha^\triangleleft)^\sharp \to \overline{X}$ lifting $p_\alpha : (K_\alpha^\triangleleft)^\sharp \to (X, S)$ is a q-limit diagram. Invoking the assumption that $\overline{Y}$ is $\mathfrak{P}$-fibered, we deduce that $\widetilde{p}_\alpha = p \circ \overline{p}_\alpha$ is a π-limit diagram in Y. Moreover, $\widetilde{p}_\alpha$ is one of the diagrams defining the categorical pattern $\pi^* \mathfrak{P}$, so our assumption that $\overline{X}$ is $\mathfrak{P}$-fibered ensures that $\overline{p}_\alpha$ is a p-limit diagram. Since $q = \pi \circ p$, the desired result now follows from Proposition HTT.4.3.1.5 .

□

B.3 Flat Inner Fibrations

Let $\mathcal{C}$ and $\mathcal{D}$ be categories. A *distributor* from $\mathcal{C}$ to $\mathcal{D}$ is a functor $M : \mathcal{C}^{op} \times \mathcal{D} \to \mathcal{S}\mathrm{et}$. Any functor $F : \mathcal{C} \to \mathcal{D}$ determines a distributor M_F from $\mathcal{C}$ to $\mathcal{D}$, given by the formula $M_F(C, D) = \mathrm{Hom}_{\mathcal{D}}(FC, D)$. Consequently, we can think of a distributor as a kind of generalized functor. As with ordinary functors, distributors can be composed: if we are given distributors $M : \mathcal{C}^{op} \times \mathcal{D} \to \mathcal{S}\mathrm{et}$ and $N : \mathcal{D}^{op} \times \mathcal{E} \to \mathcal{S}\mathrm{et}$, then the composition $N \circ M : \mathcal{C}^{op} \times \mathcal{E} \to \mathcal{S}\mathrm{et}$ is given by the formula

$$(N \circ M)(C, E) = \int_{D \in \mathcal{D}} M(C, D) \times N(D, E),$$

(the right hand side indicates the coend of the functor $M(C, \bullet) \times N(\bullet, E)$ along $\mathcal{D}$).

The above ideas can be reformulated using the language of correspondences. Recall that a *correspondence* from a category $\mathcal{C}$ to another category $\mathcal{D}$ is a category category $\mathcal{M}$ containing $\mathcal{C}$ and $\mathcal{D}$ as full subcategories, equipped with a functor $p : \mathcal{M} \to [1]$ such that $\mathcal{C} = p^{-1}\{0\}$ and $\mathcal{D} = p^{-1}\{1\}$. Every correspondence $\mathcal{M}$ from $\mathcal{C}$ to $\mathcal{D}$ determines a distributor M, given by the formula $M(C, D) = \mathrm{Hom}_{\mathcal{M}}(C, D)$. Conversely, if we are given a distributor M, we can construct a correspondence $\mathcal{M}$ as follows:

- An object of $\mathcal{M}$ is either an object of $\mathcal{C}$ or an object of $\mathcal{D}$.

小红书
小红书号:3189205503 qq

- Morphisms in $\mathcal{M}$ are given by the formula

$$\mathrm{Hom}_{\mathcal{M}}(X,Y) = \begin{cases} \mathrm{Hom}_{\mathcal{C}}(X,Y) & \text{if } X,Y \in \mathcal{C} \\ \mathrm{Hom}_{\mathcal{D}}(X,Y) & \text{if } X,Y \in \mathcal{D} \\ M(X,Y) & \text{if } X \in \mathcal{C}, Y \in \mathcal{D} \\ \emptyset & \text{if } X \in \mathcal{D}, Y \in \mathcal{C}\,. \end{cases}$$

We can summarize the above discussion informally as follows: given a pair of categories $\mathcal{C}$ and $\mathcal{D}$, giving a distributor from $\mathcal{C}$ to $\mathcal{D}$ is equivalent to giving a correspondence from $\mathcal{C}$ to $\mathcal{D}$.

The composition of distributors has a natural interpretation in the language of correspondences. To see this, suppose we are given categories $\mathcal{C}$, $\mathcal{D}$, and $\mathcal{E}$. Consider the problem of constructing a category $\mathcal{X}$ equipped with a functor $p : \mathcal{X} \to [2]$ such that $\mathcal{C} = p^{-1}\{0\}$, $\mathcal{D} = p^{-1}\{1\}$, and $\mathcal{E} = p^{-1}\{2\}$. Any such category $\mathcal{X}$ determines distributors $M : \mathcal{C}^{op} \times \mathcal{D} \to \mathcal{S}\mathrm{et}$, $N : \mathcal{D}^{op} \times \mathcal{E} \to \mathcal{S}\mathrm{et}$, and $P : \mathcal{C}^{op} \times \mathcal{E} \to \mathcal{S}\mathrm{et}$, given by the formulas

$$M(C,D) = \mathrm{Hom}_{\mathcal{X}}(C,D) \qquad N(D,E) = \mathrm{Hom}_{\mathcal{X}}(D,E) \qquad P(C,E) = \mathrm{Hom}_{\mathcal{X}}(C,E).$$

The composition law on $\mathcal{X}$ determines (and is determined by) a natural transformation of distributors $(N \circ M) \to P$, where $N \circ M$ is defined as above.

Now suppose that we are not given $\mathcal{X}$: instead, we are given a correspondence $\mathcal{M}$ from $\mathcal{C}$ to $\mathcal{D}$ and another correspondence $\mathcal{N}$ from $\mathcal{D}$ to $\mathcal{E}$. Then $\mathcal{M}$ and $\mathcal{N}$ determine distributors $M : \mathcal{C}^{op} \times \mathcal{D} \to \mathcal{S}\mathrm{et}$ and $N : \mathcal{D}^{op} \times \mathcal{E} \to \mathcal{S}\mathrm{et}$. From the above analysis, we see that the following data are equivalent:

(a) A category $\mathcal{X}$ equipped with a functor $p : \mathcal{X} \to [2]$ such that $p^{-1}\{0 < 1\} = \mathcal{M}$ and $p^{-1}\{1 < 2\} = \mathcal{N}$.

(b) A distributor $P : \mathcal{C}^{op} \times \mathcal{E} \to \mathcal{S}\mathrm{et}$ together with a natural transformation $\alpha : (N \circ M) \to P$.

Neither type of data is uniquely determined by $\mathcal{M}$ and $\mathcal{N}$, even up to isomorphism. However, there is always a canonical choice for the data of type (b): namely, we can take $P = N \circ M$ and α to be the identity map. The equivalence between (b) and (a) then shows that there is a canonical choice for the category $\mathcal{X}$. We will refer to this canonical choice as the *composition* of the correspondences $\mathcal{M}$ and $\mathcal{N}$. Concretely, it can be described as the pushout $\mathcal{M} \coprod_{\mathcal{D}} \mathcal{N}$.

Our goal in this section is to explain how some of the above ideas can be carried over to the ∞-categorical setting. Motivated by the preceding discussion, we introduce the following definition:

Definition B.3.1. Suppose we are given a functor of ∞-categories $p : \mathcal{X} \to \Delta^2$. We will say that p is *flat* if the inclusion $\mathcal{X} \times_{\Delta^2} \Lambda^2_1 \hookrightarrow \mathcal{X}$ is a categorical equivalence.

小红书
小红书号:3189205503 qq

In other words, a functor $p : \mathcal{X} \to \Delta^2$ is flat if the diagram

$$\begin{array}{ccc} \mathcal{X} \times_{\Delta^2} \{1\} & \longrightarrow & \mathcal{X} \times_{\Delta^2} \Delta^{\{0,1\}} \\ \downarrow & & \downarrow \\ \mathcal{X} \times_{\Delta^2} \Delta^{\{1,2\}} & \longrightarrow & \mathcal{X} \end{array}$$

is a homotopy pushout diagram (with respect to the Joyal model structure). More informally, p is flat if it exhibits the correspondence $\mathcal{X} \times_{\Delta^2} \Delta^{\{0,2\}}$ as the composition of the correspondences $\mathcal{X} \times_{\Delta^2} \Delta^{\{0,1\}}$ and $\mathcal{X} \times_{\Delta^2} \Delta^{\{1,2\}}$.

Our first goal in this section is to establish the following recognition criterion for flat maps:

Proposition B.3.2. Let $\mathcal{X}$ be an ∞-category equipped with a functor $p : \mathcal{X} \to \Delta^2$. Let $\mathcal{C} = p^{-1}\{0\}$, let $\mathcal{D} = p^{-1}\{1\}$, and let $\mathcal{E} = p^{-1}\{2\}$. The following conditions are equivalent:

(1) The map p is flat.

(2) For every morphism $f : C \to E$ in $\mathcal{X}$ from an object $C \in \mathcal{C}$ to an object $E \in \mathcal{E}$, the ∞-category $\mathcal{D}_{C//E} = \mathcal{D} \times_{\mathcal{X}} \mathcal{X}_{C//E}$ is weakly contractible.

Remark B.3.3. Criterion (2) of Proposition B.3.2 can be regarded as a version of the formula

$$(N \circ M)(C, E) = \int_{D \in \mathcal{D}} M(C, D) \times N(D, E)$$

describing the composition of a pair of distributors.

Example B.3.4. Let $p : \mathcal{X} \to \Delta^2$ be an inner fibration of simplicial sets. Let $\mathcal{C} = p^{-1}\{0\}$, $\mathcal{D} = p^{-1}\{1\}$, and $\mathcal{E} = p^{-1}\{2\}$. Suppose that for every object $C \in \mathcal{C}$, there exists a p-coCartesian morphism $f : C \to D$, where $D \in \mathcal{D}$. Then p is flat.

To prove this, consider an arbitrary morphism $g : C \to E$ in $\mathcal{M}$, where $C \in \mathcal{C}$ and $E \in \mathcal{E}$. Choose a p-coCartesian morphism $f : C \to D$ in $\mathcal{M}$ for $D \in \mathcal{D}$. Using the assumption that f is p-coCartesian, we can find a commutative diagram

$$\begin{array}{ccccc} & & D & & \\ & \overset{f}{\nearrow} & & \overset{h}{\searrow} & \\ C & & \xrightarrow{\quad g \quad} & & E \end{array}$$

which we can identify with an object $\overline{D} \in \mathcal{D}_{C//E}$ lifting D. To show that $\mathcal{D}_{C//E}$ is weakly contractible, it suffices to show that $\overline{D}$ is an initial object of $\mathcal{D}_{C//E}$. In view of Proposition HTT.1.2.13.8 , it will suffice to show that $\overline{D}$ is an initial object of $\mathcal{D}_{C/}$, which is equivalent to the assertion that f is locally p-coCartesian.

小红书
小红书号:3189205503 qq

Example B.3.5. Let $p : \mathcal{X} \to \Delta^2$ be an inner fibration of simplicial sets. Let $\mathcal{C} = p^{-1}\{0\}$, $\mathcal{D} = p^{-1}\{1\}$, and $\mathcal{E} = p^{-1}\{2\}$. Suppose that for every object $E \in \mathcal{E}$, there exists a p-Cartesian morphism $f : D \to E$, where $D \in \mathcal{D}$. Then p is flat. The proof is identical to that of Example B.3.4.

The proof of Proposition B.3.2 will require some preliminaries.

Lemma B.3.6. Let $\mathcal{C}$ be a simplicial category equipped with a functor $\mathcal{C} \to [1]$, where $[1]$ denotes the (discrete) category $\{0 < 1\}$. Suppose that the inclusion $\mathcal{C}_0 \hookrightarrow \mathcal{C}$ is a cofibration of simplicial categories. Then, for every object $D \in \mathcal{C}_1$, the functor $C \mapsto \mathrm{Map}_{\mathcal{C}}(C, D)$ is a projectively cofibrant object of $F \in (\mathcal{S}\mathrm{et}_\Delta)^{\mathcal{C}_0^{op}}$.

Proof. We must show that every trivial projective fibration $\alpha : G \to G'$ in $(\mathcal{S}\mathrm{et}_\Delta)^{\mathcal{C}_0^{op}}$ has the right lifting property with respect to F. Define a new simplicial category $\mathcal{C}[G]$ as follows:

(*i*) The objects of $\mathcal{C}[G]$ are the objects of $\mathcal{C}$.

(*ii*) For $C, C' \in \mathcal{C}$, we have

$$\mathrm{Map}_{\mathcal{C}[G]}(C, C') = \begin{cases} \emptyset & \text{if } C \in \mathcal{C}_1, C' \in \mathcal{C}_0 \\ \mathrm{Map}_{\mathcal{C}}(C, C') \times G(C)^{\mathrm{Map}_{\mathcal{C}}(C', D)} & \text{if } C \in \mathcal{C}_0, C' \in \mathcal{C}_1 \\ \mathrm{Map}_{\mathcal{C}}(C, C') & \text{otherwise} \end{cases}$$

Let $\mathcal{C}[G']$ be defined similarly. Unwinding the definitions, we see that α has the right lifting property with respect to F if and only if the induced map $\overline{\alpha} : \mathcal{C}[G] \to \mathcal{C}[G']$ has the right lifting property with respect to the inclusion $i : \mathcal{C}_0 \subseteq \mathcal{C}$. Since i is a cofibration, this follows from the observation that $\overline{\alpha}$ is a trivial fibration of simplicial categories. □

Lemma B.3.7. Suppose we are given an inner fibration of simplicial sets $p : X \to \Lambda^2_1$. Let C be an initial object of $\mathcal{M} = p^{-1}\Delta^{\{0,1\}}$, let E be a final object of $\mathcal{N} = p^{-1}\Delta^{\{1,2\}}$, let $\mathcal{D} = \mathcal{M} \cap \mathcal{N} = p^{-1}\{1\}$, and let $f : X \to \mathcal{M}$ be a categorical equivalence from X to an ∞-category $\mathcal{M}$. Then there is a canonical isomorphism $\mathrm{Map}_{\mathcal{M}}(f(C), f(E)) \simeq [\mathcal{D}]$ in the homotopy category $\mathcal{H}$ of spaces.

Proof. We can identify $\mathrm{Map}_{\mathcal{M}}(f(C), f(E))$ with the simplicial set $\mathrm{Map}_{\mathfrak{C}[X]}(C, E)$. Let $F : \mathfrak{C}[\mathcal{D}] \to \mathcal{S}\mathrm{et}_\Delta$ be the functor given by the formula $F(D) = \mathrm{Map}_{\mathfrak{C}[\mathcal{M}]}(C, D)$, and let $G : \mathfrak{C}[\mathcal{D}]^{op} \to \mathcal{S}\mathrm{et}_\Delta$ be given by the formula $G(D) = \mathrm{Map}_{\mathfrak{C}[\mathcal{N}]}(D, E)$. Since $\mathfrak{C}[X]$ is isomorphic to the pushout $\mathfrak{C}[\mathcal{M}] \coprod_{\mathfrak{C}[\mathcal{D}]} \mathfrak{C}[\mathcal{N}]$, the simplicial set $\mathrm{Map}_{\mathfrak{C}[X]}(C, E)$ can be computed as the coend

$$\int_{D \in \mathfrak{C}[\mathcal{D}]} F(D) \times G(D).$$

Lemma B.3.6 guarantees that the functor G is projectively cofibrant, so the construction

$$H \mapsto \int_{D \in \mathfrak{C}[\mathcal{D}]} H(D) \times G(D)$$

小红书
小红书号:3189205503 qq

carries weak equivalences between injectively cofibrant objects of $(\mathcal{S}\mathrm{et}_\Delta)^{\mathfrak{C}[\mathcal{D}]}$ to weak homotopy equivalences of simplicial sets (Remark HTT.A.2.9.27). Since C is an initial object of $\mathcal{M}$, the canonical map $F \to F_0$ is a weak equivalence, where $F_0 : \mathfrak{C}[\mathcal{D}] \to \mathcal{S}\mathrm{et}_\Delta$ is the constant functor taking the value Δ^0. It follows that α induces a homotopy equivalence

$$\mathrm{Map}_{\mathfrak{C}[X]}(C, E) \to \varinjlim G.$$

Since $E \in \mathcal{N}$ is final, we also have a weak equivalence $G \to G_0$, where $G_0 : \mathfrak{C}[\mathcal{D}]^{op} \to \mathcal{S}\mathrm{et}_\Delta$ denotes the constant functor taking the value 0. It follows that G is a cofibrant replacement for G_0 with respect to the projective model structure on $(\mathcal{S}\mathrm{et}_\Delta)^{\mathfrak{C}[\mathcal{D}]^{op}}$, so we can identify $\varinjlim G$ with a homotopy colimit of the diagram G_0. Applying Theorem HTT.4.2.4.1 , we can identify this homotopy colimit with a colimit of the constant diagram $\mathcal{D}^{op} \to \mathcal{S}$ taking the value Δ^0. This colimit is represented by the simplicial set $\mathcal{D}$ in the homotopy category $\mathcal{H}$ (Corollary HTT.3.3.4.6). □

Proof of Proposition B.3.2. Let $X = \mathcal{X} \times_{\Delta^2} \Lambda^2_1$. Using the small object argument, we can factor the inclusion $X \hookrightarrow \mathcal{X}$ as a composition

$$X \overset{i}{\hookrightarrow} \mathcal{X}' \overset{q}{\to} \mathcal{X}$$

where i is inner anodyne, the map q is an inner fibration, and i induces an isomorphism $X \to \mathcal{X}' \times_{\Delta^2} \Lambda^2_1$. We will abuse notation by identifying X (and therefore also the ∞-categories $\mathcal{C}, \mathcal{D}, \mathcal{E} \subseteq X$) with a simplicial subset of $\mathcal{X}'$ via the map i.

Condition (1) is equivalent to the assertion that q is an equivalence of ∞-categories. Since q is bijective on vertices, this is equivalent to the assertion that q induces a homotopy equivalence $\theta : \mathrm{Map}_{\mathcal{X}'}(C, E) \to \mathrm{Map}_{\mathcal{X}}(C, E)$ for every pair of objects $C, E \in \mathcal{X}'$. This condition is obvious unless $C \in \mathcal{C}$ and $E \in \mathcal{E}$. In the latter case, it is equivalent to the requirement that for every morphism $f : C \to E$ in $\mathcal{X}$, the homotopy fiber of the map θ (taken over the point $f \in \mathrm{Map}_{\mathcal{X}}(C, E)$) is contractible. It will therefore suffice to prove the equivalence of the following conditions:

(1′) The homotopy fiber of θ over $\{f\}$ is contractible.

(2′) The ∞-category $\mathcal{D}_{C//E}$ is weakly contractible.

Suppose we are given a right fibration $\overline{\mathcal{X}} \to \mathcal{X}$, and that we can lift f to a morphism $\overline{f} : \overline{C} \to \overline{E}$ in $\overline{\mathcal{X}}$. Let $\overline{\mathcal{X}}' = \mathcal{X}' \times_{\mathcal{X}} \overline{\mathcal{X}}$; it follows from Proposition HTT.3.3.1.3 that the inclusion $\overline{\mathcal{X}} \times_{\Delta^2} \Lambda^2_1 \hookrightarrow \overline{\mathcal{X}}'$ remains a categorical equivalence. Using Proposition HTT.2.4.4.2 , we deduce the existence of a homotopy pullback diagram

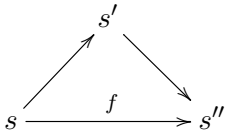
$$\begin{array}{ccc} \mathrm{Map}_{\overline{\mathcal{X}}'}(\overline{C}, \overline{E}) & \xrightarrow{\overline{\theta}} & \mathrm{Map}_{\overline{\mathcal{X}}}(\overline{C}, \overline{E}) \\ \downarrow & & \downarrow \\ \mathrm{Map}_{\mathcal{X}'}(C, E) & \xrightarrow{\theta} & \mathrm{Map}_{\mathcal{X}}(C, E). \end{array}$$

小红书 小红书号:3189205503 qq

It follows that $(1')$ is satisfied by the morphism f of $\mathcal{X}$ if and only if it is satisfied by the morphism $\overline{f}$ over $\overline{\mathcal{X}}$. Proposition HTT.2.1.2.5 guarantees that the map $\overline{\mathcal{X}}_{\overline{C}//\overline{E}} \to \mathcal{X}_{C//E}$ is a trivial Kan fibration, so that $(2')$ is satisfied by f if and only if it is satisfied by $\overline{f}$. It follows that we are free to replace $\mathcal{M}$ by $\overline{\mathcal{X}} = \mathcal{X}_{/E}$, and thereby reduce to the case where E is a final object of $\mathcal{X}$. A similar argument shows that we can assume that C is an initial object of $\mathcal{X}$. In this special case, the space $\mathrm{Map}_{\mathcal{X}}(C, E)$ is contractible, so we can reformulate $(1')$ as follows:

$(1'')$ The space $\mathrm{Map}_{\mathcal{X}'}(C, E)$ is contractible.

If C is an initial object of $\mathcal{X}$, then $\mathcal{X}_{C/} \to \mathcal{X}$ is a trivial Kan fibration. Moreover, if E is a final object of $\mathcal{X}$ then it is a final object of $\mathcal{X}_{C/}$ (Proposition HTT.1.2.13.8), so the projection $\mathcal{X}_{C//E} \to \mathcal{X}_{C/}$ is also a trivial Kan fibration. We therefore obtain the following reformulation of condition $(2')$:



$(2'')$ The ∞-category $\mathcal{D}$ is weakly contractible.

The equivalence of $(1'')$ and $(2'')$ now follows from Lemma B.3.7. □

For many applications, it is useful to generalize Definition B.3.1 to the case of an arbitrary base simplicial set S.

Definition B.3.8. Let $p : X \to S$ be an inner fibration of simplicial sets, and let σ be a 2-simplex of S. We will say that p is *flat over* σ if the induced inner fibration $X \times_S \Delta^2 \to \Delta^2$ is flat, in the sense of Definition B.3.1. We will say that p is *flat* if it is flat over every 2-simplex of S.

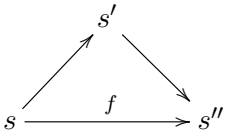
Remark B.3.9. Let $p : X \to S$ be an inner fibration of simplicial sets. Using Proposition B.3.2, we see that p is flat if and only if, for every 2-simplex

in S and every edge $\overline{f} : x \to y$ in X lifting f, the ∞-category $X_{x//y} \times_{S_{s//s''}} \{s'\}$ is weakly contractible.

Example B.3.10. Let $p : X \to S$ be an inner fibration of simplicial sets. Then p is flat over any degenerate 2-simplex of S, since the induced functor $X \times_S \Delta^2 \to \Delta^2$ satisfies the hypotheses of either Example B.3.4 or Example B.3.5. It follows that an inner fibration $p : X \to \Delta^2$ is flat in the sense of Definition B.3.8 if and only if it is flat in the sense of Definition B.3.1.

Example B.3.11. Let $p : X \to S$ be a coCartesian fibration of simplicial sets. Then p is a flat categorical fibration: this is an immediate consequence of Example B.3.4. Similarly, if p is a Cartesian fibration, then p is flat.

小红书
小红书号:3189205503 qq



Remark B.3.12. Suppose given a pullback diagram of simplicial sets

$$\begin{array}{ccc} X' & \xrightarrow{q} & X \\ \downarrow{\scriptstyle p'} & & \downarrow{\scriptstyle p} \\ S' & \longrightarrow & S. \end{array}$$

If p is a flat inner fibration, then so is p'.

Proposition B.3.13. Let $q : X \to S$ be a flat inner fibration of simplicial sets, and let $x \in X$ be a vertex. Then the induced map $X_{x/} \to S_{q(x)/}$ is a flat inner fibration.

Proof. Fix a 2-simplex

in $S_{q(x)/}$, and let $\overline{f} : y \to z$ be an edge of $X_{x/}$ lifting f. We wish to prove that the ∞-category

$$\mathcal{C} = (X_{x/})_{y//z} \times_{(S_{q(x)/})_{s//s''}} \{s'\}$$

is weakly contractible. Let $p : X_{x/} \to X$ be the projection map; then p induces a trivial Kan fibration

$$\mathcal{C} \to \mathcal{C}_0 = X_{p(y)//p(z)} \times_{S_{qp(y)//qp(z)}} \Delta^0.$$

Since q is flat, the ∞-category $\mathcal{C}_0$ is weakly contractible, so that $\mathcal{C}$ is weakly contractible as desired. □

Proposition B.3.2 admits the following generalization:

Proposition B.3.14. Let $p : X \to S$ be an inner fibration of simplicial sets. The following conditions are equivalent:

(1) For every inner anodyne map $A \hookrightarrow B$ of simplicial sets and every map $B \to S$, the induced map $X \times_S A \to X \times_S B$ is a categorical equivalence.

(2) The inner fibration p is flat.

The remainder of this section is devoted to the proof of Proposition B.3.14. We begin by noting some of its consequences.

Corollary B.3.15. Let $p : \mathcal{C} \to \mathcal{D}$ be a flat categorical fibration between ∞-categories. Then, for every categorical equivalence of simplicial sets $A \to B$ and every diagram $B \to \mathcal{D}$, the induced map $\theta : A \times_{\mathcal{D}} \mathcal{C} \to B \times_{\mathcal{D}} \mathcal{C}$ is an equivalence of ∞-categories.

小红书
小红书号:3189205503 qq

Proof. Every map $f : B \to \mathcal{D}$ factors as a composition

$$B \xrightarrow{f'} B' \xrightarrow{f''} \mathcal{D},$$

where f' is inner anodyne and f'' is an inner fibration (so that B' is an ∞-category). We obtain a commutative diagram

$$\begin{array}{ccc} A \times_{\mathcal{D}} \mathcal{C} & \xrightarrow{\beta} & B' \times_{\mathcal{D}} \mathcal{C} \\ & {\scriptstyle\theta} \searrow \quad \nearrow {\scriptstyle\alpha} & \\ & B \times_{\mathcal{D}} \mathcal{C}. & \end{array}$$

Proposition B.3.14 implies that α is a categorical equivalence. By the two-out-of-three property, it suffices to show that β is a categorical equivalence. We may therefore replace B by B' and thereby reduce to the case where B is an ∞-category.

The map $g : A \to B$ factors as a composition

$$A \xrightarrow{g'} A' \xrightarrow{g''} B$$

where g' is inner anodyne and g'' is an inner fibration (so that A' is an ∞-category). We obtain a commutative diagram

$$\begin{array}{ccc} A \times_{\mathcal{D}} \mathcal{C} & \xrightarrow{\theta} & B \times_{\mathcal{D}} \mathcal{C} \\ & {\scriptstyle\gamma} \searrow \quad \nearrow {\scriptstyle\delta} & \\ & A' \times_{\mathcal{D}} \mathcal{C}. & \end{array}$$

Proposition B.3.14 implies that γ is a categorical equivalence. Using the two-out-of-three property, we are reduced to proving that δ is a categorical equivalence. We may therefore replace A by A' and thereby reduce to the case where A is an ∞-category.

Consider the pullback diagram

$$\begin{array}{ccc} A \times_{\mathcal{D}} \mathcal{C} & \xrightarrow{\theta} & B \times_{\mathcal{D}} \mathcal{C} \\ \downarrow & & \downarrow \\ A & \xrightarrow{g} & B. \end{array}$$

Since the vertical maps in this diagram are categorical fibrations and the simplicial sets A and B are ∞-categories, Proposition HTT.A.2.4.4 guarantees that this diagram is homotopy Cartesian (with respect to the Joyal model structure). Since the g is a categorical equivalence, it follows that θ is a categorical equivalence as well. □

Corollary B.3.16. Let $f : \mathcal{C} \to \mathcal{D}$ and $g : \mathcal{D} \to \mathcal{E}$ be flat categorical fibrations between ∞-categories. Then $g \circ f$ is a flat categorical fibration.

小红书
小红书号:3189205503 qq

Proof. Since $g \circ f$ is evidently a categorical fibration, it will suffice to show that $g \circ f$ is flat. Choose a 2-simplex $\sigma : \Delta^2 \to \mathcal{E}$; we wish to show that the inclusion $\mathcal{C} \times_{\mathcal{E}} \Lambda^2_1 \subseteq \mathcal{C} \times_{\mathcal{E}} \Delta^2$ is a categorical equivalence. Let $\mathcal{D}' = \mathcal{D} \times_{\mathcal{E}} \Delta^2$ and $\mathcal{D}'' = \mathcal{D} \times_{\mathcal{E}} \Lambda^2_1$. Since g is flat, the inclusion $\mathcal{D}'' \subseteq \mathcal{D}'$ is a categorical equivalence. Since f is flat, Corollary B.3.15 guarantees that the inclusion

$$\mathcal{C} \times_{\mathcal{E}} \Lambda^2_1 \simeq \mathcal{C} \times_{\mathcal{D}} \mathcal{D}'' \subseteq \mathcal{C} \times_{\mathcal{D}} \mathcal{D}' \simeq \mathcal{C} \times_{\mathcal{E}} \Delta^2$$

is a categorical equivalence, as desired. □

The proof of Proposition B.3.14 will require some preliminaries.

Proposition B.3.17. Let $p : \mathcal{M} \to \Delta^1$ be a correspondence from an ∞-category $\mathcal{C} = \mathcal{M} \times_{\Delta^1} \{0\}$ to $\mathcal{D} = \mathcal{M} \times_{\Delta^1} \{1\}$. Let $\mathcal{X} = \mathrm{Map}_{\Delta^1}(\Delta^1, \mathcal{M})$ be the ∞-category of sections of the map p. Then the canonical map

$$\mathcal{C} \coprod_{\mathcal{X} \times \{0\}} (\mathcal{X} \times \Delta^1) \coprod_{\mathcal{X} \times \{1\}} \mathcal{D} \to \mathcal{M}$$

is a categorical equivalence.

Proof. For every ∞-category $\mathcal{A}$, we let $\mathcal{A}^\natural$ denote the marked simplicial set $(\mathcal{A}, M_{\mathcal{A}})$, where $\mathcal{A}$ is the collection of all equivalences in $\mathcal{A}$. Since the category of marked simplicial sets is Quillen equivalent to the category of simplicial sets (with the Joyal model structure), it will suffice to prove the following:

(*A*) The diagram

$$\begin{array}{ccc} \mathcal{X}^\natural \times (\partial \Delta^{\{1,2\}})^\flat & \longrightarrow & \mathcal{C}^\natural \times \mathcal{D}^\natural \\ \downarrow & & \downarrow \\ \mathcal{X}^\natural \times (\Delta^{\{1,2\}})^\flat & \longrightarrow & \mathcal{M}^\natural \end{array}$$

is a homotopy pushout square of marked simplicial sets.

To prove this, we let $\mathcal{Y}$ denote the full subcategory of $\mathrm{Fun}(\Delta^1, \mathcal{M}) \times \Delta^3$ spanned by those pairs $(f : A \to A', i)$ satisfying one of the following conditions:

- We have $i = 0$ and f is an equivalence in $\mathcal{C}$.
- We have $i = 1$ or $i = 2$ and f belongs to $\mathcal{X}$.
- We have $i = 3$ and f is an equivalence in $\mathcal{D}$.

For each simplicial subset $K \subseteq \Delta^3$, we let $\mathcal{Y}_K = \mathcal{Y} \times_{\Delta^3} K$, and let $\overline{\mathcal{Y}}_K$ denote the marked simplicial set $(\mathcal{Y}_K, M_K)$, where M_K is the collection of all edges $\alpha : (f, i) \to (f', i')$ in $\mathcal{Y}_K$ satisfying one of the following three conditions:

小红书
小红书号:3189205503 qq

- The map α is an equivalence in $\mathcal{Y}$.
- We have $i = 0$, $i' = 1$, and α corresponds to a commutative diagram

$$\begin{array}{ccc} C & \xrightarrow{g} & C'' \\ \downarrow{\scriptstyle f} & & \downarrow{\scriptstyle f'} \\ C' & \longrightarrow & D \end{array}$$

  for which g is an equivalence.

- We have $i = 2$, $i' = 3$, and α corresponds to a commutative diagram

$$\begin{array}{ccc} C & \longrightarrow & D \\ \downarrow{\scriptstyle f} & & \downarrow{\scriptstyle f'} \\ D'' & \xrightarrow{g} & D' \end{array}$$

  for which g is an equivalence.

We observe that there is a retraction r of $\mathcal{Y}$ onto the full subcategory $\mathcal{Y}_{\Delta^{\{0,2,3\}}}$, which carries an object $f : C \to D$ of $\mathcal{Y}_{\{1\}}$ to the object $\mathrm{id}_C \in \mathcal{Y}_{\{0\}}$. This retraction is equipped with a natural transformation $r \to \mathrm{id}_{\mathcal{Y}}$, which determines a map of marked simplicial sets $\overline{\mathcal{Y}}_{\Delta^3} \times (\Delta^1)^\sharp \to \overline{\mathcal{Y}}_{\Delta^3}$. Using this deformation retraction, we deduce the following:

(∗) Let S be a subset of $\{0, 2, 3\}$ containing $\{0\}$. Then the inclusion $\overline{\mathcal{Y}}_{\Delta^S} \subseteq \overline{\mathcal{Y}}_{\Delta^{S \cup \{1\}}}$ is a weak equivalence of marked simplicial sets.

A similar argument proves:

(∗′) Let S be a subset of $\{0, 1, 3\}$ containing $\{3\}$. Then the inclusion $\overline{\mathcal{Y}}_{\Delta^S} \subseteq \overline{\mathcal{Y}}_{\Delta^{S \cup \{2\}}}$ is a weak equivalence of marked simplicial sets.

Let $\phi : \Delta^3 \to \Delta^1$ be the map characterized by $\phi^{-1}\{0\} = \Delta^{\{0,1\}} \subseteq \Delta^3$, and consider the map

$$\theta : \mathcal{Y} \subseteq \mathrm{Fun}(\Delta^1, \mathcal{M}) \times \Delta^3 \xrightarrow{\mathrm{id} \times \phi} \mathrm{Fun}(\Delta^1, \mathcal{M}) \times \Delta^1 \to \mathcal{M}\,.$$

Consider the diagram

$$\begin{array}{ccccc} \mathcal{C}^\natural & \longrightarrow & \overline{\mathcal{Y}}_{\{0\}} & \longrightarrow & \overline{\mathcal{Y}}_{\Delta^{\{0,1\}}} \\ & \searrow^{\mathrm{id}} & & & \downarrow{\scriptstyle \theta_0} \\ & & & & \mathcal{C}^\natural\,. \end{array}$$

Using (∗) and the observation that the diagonal inclusion $\mathcal{C} \to \mathcal{Y}_{\{0\}}$ is an equivalence of ∞-categories, we deduce that θ_0 is a weak equivalence of marked simplicial sets. A similar argument gives an equivalence of marked simplicial sets $\overline{\mathcal{Y}}_{\Delta^{\{2,3\}}} \to \mathcal{D}^\natural$. Using this observation, we can reformulate (A) as follows:

小红书
小红书号:3189205503 qq

(B) The diagram

$$\begin{array}{ccc} \overline{y}_{\{1\}} \coprod \overline{y}_{\{2\}} & \longrightarrow & \overline{y}_{\Delta^{\{0,1\}}} \coprod \overline{y}_{\Delta^{\{2,3\}}} \\ \downarrow & & \downarrow \\ \overline{y}_{\Delta^{\{1,2\}}} & \longrightarrow & \mathcal{M}^{\natural} \end{array}$$

is a homotopy pushout square of marked simplicial sets.

We have a commutative diagram of marked simplicial sets

$$\begin{array}{ccc} \overline{y}_{\Delta^{\{0,3\}}} & & \\ {\scriptstyle \beta_1}\downarrow & \searrow^{\beta_0} & \\ \overline{y}_{\Delta^3} & \longrightarrow & \mathcal{M}^{\natural} \\ {\scriptstyle \beta_2}\uparrow & \nearrow_{\beta_3} & \\ \overline{y}_K & & \end{array}$$

where $K = \Delta^{\{0,1\}} \coprod_{\{1\}} \Delta^{\{1,2\}} \coprod_{\{2\}} \Delta^{\{2,3\}} \subseteq \Delta^3$. We wish to prove that β_3 is a weak equivalence of marked simplicial sets. Since β_0 is an isomorphism of marked simplicial sets, it suffices to show that β_1 and β_2 are weak equivalences of marked simplicial sets.

To prove that β_1 is a weak equivalence, we factor β_1 as a composition

$$\overline{y}_{\Delta^{\{0,3\}}} \xrightarrow{\beta_1'} \overline{y}_{\Delta^{\{0,1,3\}}} \xrightarrow{\beta_1''} \overline{y}_{\Delta^3}.$$

Assertion $(*)$ implies that β_1' is a weak equivalence, and assertion $(*')$ implies that β_1'' is a weak equivalence.

To prove that β_2 is a weak equivalence, we factor β_2 as a composition

$$\overline{y}_K \xrightarrow{\beta_2'} \overline{y}_{\Delta^{\{0,1,2\}} \coprod_{\{2\}} \Delta^{\{2,3\}}} \xrightarrow{\beta_2''} \overline{y}_{\Delta^{\{0,1,2\}} \coprod_{\Delta^{\{1,2\}}} \Delta^{\{1,2,3\}}} \xrightarrow{\beta_2'''} \overline{y}_{\Delta^3}.$$

The map β_2' is a pushout of the inclusion

$$y^{\natural}_{\Delta^{\{0,1\}}} \coprod_{y^{\natural}_{\{1\}}} y^{\natural}_{\Delta^{\{1,2\}}} \to y^{\natural}_{\Delta^{\{0,1,2\}}}.$$

Consequently, to prove β_2' it suffices to show that the map $y_{\Delta^{\{0,1,2\}}} \to \Delta^{\{0,1,2\}}$ is a flat inner fibration, which follows from Example B.3.5. The same argument shows that β_2'' is a weak equivalence. The map β_2''' is a pushout of the inclusion

$$y^{\natural}_{\Delta^{\{0,1,2\}} \coprod_{\Delta^{\{1,2\}}} \Delta^{\{1,2,3\}}} \to y^{\natural}.$$

小红书
小红书号:3189205503 qq

To complete the proof, it will suffice to show that this map is a weak equivalence of marked simplicial sets, which is equivalent to the requirement that the composite map

$$\mathcal{Y} \to \Delta^3 \xrightarrow{\phi'} \Delta^2$$

is a flat inner fibration (here ϕ' is the map characterized by the property that $\phi'^{-1}\{1\} = \Delta^{\{1,2\}} \subseteq \Delta^3$).

In view of Proposition B.3.2, we must show that for every object $\overline{C} : C \to C'$ of $\mathrm{Fun}(\Delta^1, \mathcal{C}) \simeq \mathcal{Y}_{\{0\}}$ and every object $\overline{D} : D \to D'$ of $\mathrm{Fun}(\Delta^1, \mathcal{D}) \simeq \mathcal{Y}_{\{3\}}$, the simplicial set $\mathcal{Y}_{\overline{C}//\overline{D}} \times_{\Delta^3} \Delta^{\{1,2\}}$ is weakly contractible. This simplicial set can be identified with the product $\Delta^1 \times \mathcal{E}$, where $\mathcal{E} = \mathrm{Fun}(\Delta^1, \mathcal{M})_{\overline{C}//\overline{D}} \times_{\mathrm{Fun}(\Delta^1, \mathcal{M})} \mathcal{X}$. To complete the proof, we will show that the ∞-category $\mathcal{E}$ is weakly contractible.

We observe that an object of $\mathcal{E}$ can be identified with a commutative diagram

$$\begin{array}{ccccc} C & \xrightarrow{\gamma} & C'' & \longrightarrow & D \\ \downarrow{\scriptstyle \overline{C}} & & \downarrow & & \downarrow{\scriptstyle \overline{D}} \\ C' & \longrightarrow & D'' & \xrightarrow{\gamma'} & D' \end{array}$$

in $\mathcal{M}$, where $C'' \in \mathcal{C}$ and $D'' \in \mathcal{D}$. Let $\mathcal{E}_0$ denote the full subcategory of $\mathcal{E}$ spanned by those objects for which γ is an equivalence. The inclusion $\mathcal{E}_0 \subseteq \mathcal{E}$ admits a right adjoint, and is therefore a weak homotopy equivalence. It will therefore suffice to show that $\mathcal{E}_0$ is weakly contractible. Let $\mathcal{E}_1$ denote the full subcategory of $\mathcal{E}_0$ spanned by those diagrams for which γ' is an equivalence. The inclusion $\mathcal{E}_1 \subseteq \mathcal{E}_0$ admits a left adjoint, and is therefore a weak homotopy equivalence. It therefore suffices to show that $\mathcal{E}_1$ is weakly contractible. We complete the proof by observing that $\mathcal{E}_1$ is a contractible Kan complex. □

Lemma B.3.18. Let $p : \mathcal{M} \to \Delta^3$ be a flat inner fibration. Let $f : C \to D$ be a morphism in $\mathcal{M}$, where $C \in \mathcal{M}_0$ and $D \in \mathcal{M}_3$. Then the ∞-category $\mathcal{N} = \mathcal{M}_{C//D} \times_{\Delta^3} \Delta^{\{1,2\}}$ is weakly contractible.

Proof. Let $\mathcal{X}$ denote the ∞-category $\mathrm{Fun}_{\Delta^{\{1,2\}}}(\Delta^{\{1,2\}}, \mathcal{N})$. According to Proposition B.3.17, we have a categorical equivalence

$$\mathcal{N}_1 \coprod_{\mathcal{X} \times \{1\}} (\mathcal{X} \times \Delta^1) \coprod_{\mathcal{X} \times \{2\}} \mathcal{N}_2 \to \mathcal{N}.$$

Since $\mathcal{N}_1$ and $\mathcal{N}_2$ are weakly contractible (by virtue of the assumption that p is flat over $\Delta^{\{0,1,3\}}$ and $\Delta^{\{0,2,3\}}$), it will suffice to show that $\mathcal{X}$ is weakly contractible. Let $q : \mathcal{X} \to \mathcal{N}_2$ be the map given by evaluation at $\{2\}$. Using Corollary HTT.2.4.7.12, we deduce that q is a coCartesian fibration. Since $\mathcal{N}_2$ is weakly contractible, it will suffice to show that the fiber $q^{-1}E$ is weakly contractible, for each $E \in \mathcal{N}_2$ (Lemma HTT.4.1.3.2). This fiber can be identified with the fiber product $\{1\} \times_{\Delta^3} (\mathcal{M}_{C//D})^{/E}$, which is categorically equivalent to $\{1\} \times_{\Delta^3} (\mathcal{M}_{C//D})_{/E}$ (Proposition

小红书 小红书号:3189205503 qq

HTT.4.2.1.5). Let E_0 denote the image of E in $\mathcal{M}$. We have a trivial Kan fibration $(\mathcal{M}_{C//D})_{/E} \to \mathcal{M}_{C//E_0}$. It therefore suffices to show that $\{1\} \times_{\Delta^3} \mathcal{M}_{C//E_0}$ is weakly contractible, which follows from the assumption that p is flat over the 2-simplex $\Delta^{\{0,1,2\}}$. □

Lemma B.3.19. Let $p : \mathcal{M} \to \Delta^n$ be a flat inner fibration, and let $q : \Delta^n \to \Delta^m$ be a map of simplices which is surjective on vertices. Then the composite map $q \circ p$ is a flat inner fibration.

Proof. If $n - m > 1$, then we can factor q as a composition

$$\Delta^n \xrightarrow{q'} \Delta^{n-1} \xrightarrow{q''} \Delta^m$$

where q' and q'' are surjective on vertices. Using descending induction on $n - m$, we can assume that $n - m \leq 1$. If $n = m$ there is nothing to prove, so we may suppose that $n = m + 1$. To prove that $q \circ p$ is flat, it suffices to show that it is flat over every nondegenerate 2-simplex of Δ^m. Replacing $\mathcal{M}$ by the pullback $\mathcal{M} \times_{\Delta^m} \Delta^2$, we can reduce to the case where $m = 2$ and $n = 3$.

Fix objects $C \in (q \circ p)^{-1}\{0\}$ and $D \in (q \circ p)^{-1}\{2\}$ and a morphism $f : C \to D$ in $\mathcal{M}$; we wish to prove that the ∞-category $\mathcal{M}_{C//D} \times_{\Delta^2} \{1\}$ is weakly contractible. Let $i \in [2]$ be the unique integer such that $q^{-1}\{i\}$ is a 1-simplex of Δ^3. If $i = 0$, then the weak contractibility follows from the assumption that p is flat over $\Delta^{\{0,2,3\}} \subseteq \Delta^3$. If $i = 2$, then the weak contractibility follows from our assumption that p is flat over $\Delta^{\{0,1,3\}} \subseteq \Delta^3$. If $i = 1$, then the desired result follows from Lemma B.3.18. □

Lemma B.3.20. Let $p : \mathcal{M} \to \Delta^n$ be a flat inner fibration. Let $f : C \to D$ be a morphism in $\mathcal{M}$, where $C \in \mathcal{M}_0$ and $D \in \mathcal{M}_n$. Then the ∞-category $\mathcal{N} = \mathcal{M}_{C//D} \times_{\Delta^n} \Delta^{\{1,\ldots,n-1\}}$ is weakly contractible.

Proof. Apply Lemma B.3.19 to the map $q : \Delta^n \to \Delta^2$ characterized by the requirement that $q^{-1}\{1\} = \{1, \ldots, n-1\}$. □

Lemma B.3.21. Let $p : \mathcal{M} \to \Delta^n \times \Delta^m$ be a flat inner fibration. Then the induced map $p' : \mathcal{M} \to \Delta^m$ is a flat inner fibration.

Proof. It suffices to show that p' is flat over every nondegenerate 2-simplex of Δ^m. Replacing $\mathcal{M}$ by $\mathcal{M} \times_{\Delta^m} \Delta^2$, we can reduce to the case $m = 2$. Fix a morphism $f : C \to D$ in $\mathcal{M}$, where $C \in p'^{-1}\{0\}$ and $D \in p'^{-1}\{2\}$; we wish to show that the ∞-category $\mathcal{M}_{C//D} \times_{\Delta^2} \{1\}$ is weakly contractible. Let i and j denote the images of C and D in Δ^n, and let $\phi : \Delta^{2+j-i} \to \Delta^n \times \Delta^2$ be the map given on vertices by the formula

$$\phi(k) = \begin{cases} (i, 0) & \text{if } k = 0 \\ (i + k - 1, 1) & \text{if } 0 < k < 2 + j - i \\ (j, 2) & \text{if } k = 2 + j - i. \end{cases}$$

小红书
小红书号:3189205503 qq

The desired result now follows after applying Lemma B.3.20 to the flat inner fibration $\mathcal{M} \times_{\Delta^n \times \Delta^2} \Delta^{2+j-i} \to \Delta^{2+j-i}$. □

Proof of Proposition B.3.14. Fix an inner fibration of simplicial sets $p : X \to S$. By definition, the map p is flat if it induces a categorical equivalence $X \times_S \Lambda^2_1 \to X \times_S \Delta^2$, for every 2-simplex of S. This proves the implication (2) $\Rightarrow$ (1). For the converse, let us say that a monomorphism of simplicial sets $A \to B$ is *good* if it satisfies the following condition:

(∗) For every map of simplicial sets $B \to S$, the induced map $X \times_S A \to X \times_S B$ is a categorical equivalence.

Since the collection of trivial cofibrations with respect to the Joyal model structure is weakly saturated (in the sense of Definition HTT.A.1.2.2), we deduce that the collection of good morphisms in $\mathcal{S}\mathrm{et}_\Delta$ is also weakly saturated. We wish to prove that every inner anodyne morphism is good. In view of Proposition HTT.2.3.2.1 , it will suffice to show that for every monomorphism of simplicial sets $A \to B$ having only finitely many nondegenerate simplices, the induced map

$$(A \times \Delta^2) \coprod_{A \times \Lambda^2_1} (B \times \Lambda^2_1) \to B \times \Delta^2$$

is good. In other words, we must show that for every map $B \times \Delta^2 \to S$, the induced diagram

$$\begin{array}{ccc} X \times_S (A \times \Lambda^2_1) & \longrightarrow & X \times_S (B \times \Lambda^2_1) \\ \downarrow & & \downarrow \\ X \times_S (A \times \Delta^2) & \longrightarrow & X \times_S (B \times \Delta^2) \end{array}$$

is a homotopy pushout square (with respect to the Joyal model structure). To prove this, it suffices to show that the vertical maps are categorical equivalences. In other words, we are reduced to proving that the following assertion holds, for every simplicial set K having only finitely many nondegenerate simplices:

(∗′) For every map $K \times \Delta^2 \to S$, the inclusion $X \times_S (K \times \Lambda^2_1) \to X \times_S (K \times \Delta^2)$ is a categorical equivalence.

We now prove (∗′) by induction on the dimension n of K and the number of nondegenerate n-simplices of K. If K is empty, there is nothing to prove. Otherwise, we have a pushout diagram

$$\begin{array}{ccc} \partial \Delta^n & \longrightarrow & \Delta^n \\ \downarrow & & \downarrow \\ K' & \longrightarrow & K. \end{array}$$

Using the left properness of the Joyal model structure, we see that K will satisfy (∗′) provided that K', $\partial \Delta^n$, and Δ^n satisfy (∗′). In the first two cases, this follows from the inductive hypothesis. We

小红书
小红书号:3189205503 qq

are therefore reduced to the case $K = \Delta^n$. Fix a map $\Delta^n \times \Delta^2 \to S$, and consider the flat inner fibration $q : X \times_S (\Delta^n \times \Delta^2) \to \Delta^n \times \Delta^2$. To prove that $(*')$ is satisfied, we must show that the composition

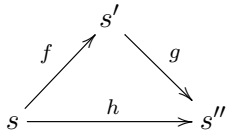
$$X \times_S (\Delta^n \times \Delta^2) \xrightarrow{q} \Delta^n \times \Delta^2 \to \Delta^2$$

is flat, which follows from Lemma B.3.21. □

B.4 Functoriality

Proposition B.2.9 can be interpreted roughly as saying that the model structure of Theorem B.0.20 defines a covariant functor of the underlying categorical pattern $\mathfrak{P}$. The remainder of this section is devoted to studying the behavior of this model structure as a *contravariant* functor of $\mathfrak{P}$. Our main result can be stated as follows:

Proposition B.4.1. Suppose we are given categorical patterns $\mathfrak{P} = (M_S, T, \{p_\alpha : K_\alpha^\triangleleft \to S\}_{\alpha \in A})$ and $\mathfrak{P}' = (M_{S'}, T', \{p'_\alpha : {K'_\alpha}^\triangleleft \to S'\}_{\alpha \in A'})$ on ∞-categories S and S'. Let $\pi : S' \to S$ be a map satisfying the following conditions:



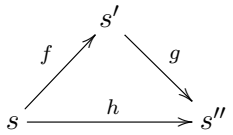
(*i*) For every vertex $s' \in S'$ and every morphism $f : s \to \pi(s')$ in S which belongs to M_S, there exists a locally π-Cartesian morphism $\overline{f} : \overline{s} \to s'$ in S' such that $\pi(\overline{f}) = f$.

(*ii*) The map π is a flat categorical fibration.

(*iii*) The map π carries $M_{S'}$ into M_S.

(*iv*) The collections of morphisms M_S and $M_{S'}$ contain all equivalences and are stable under composition (and are therefore stable under equivalence).

(*v*) Suppose given a commutative diagram



in S', where g is locally π-Cartesian, $\pi(g) \in M_S$, and $\pi(f)$ is an equivalence. Then $f \in M_{S'}$ if and only if $h \in M_{S'}$. In particular (taking $f = \mathrm{id}_s$), we deduce that every locally π-Cartesian morphism g such that $\pi(g) \in M_S$ belongs to $M_{S'}$.

(*vi*) The set of 2-simplices T' contains $\pi^{-1}(T)$, and T contains all 2-simplices $\Delta^2 \to S$ whose restriction to $\Delta^{\{0,1\}}$ is an equivalence in S.

(*vii*) Each of the simplicial sets K_α is an ∞-category, and each of the induced maps $\pi_\alpha : K_\alpha^\triangleleft \times_S S' \to K_\alpha^\triangleleft$ is a coCartesian fibration.

小红书
小红书号:3189205503 qq

(*viii*) Suppose we are given $\alpha \in A$ and a commutative diagram

in $K_\alpha^\triangleleft \times_S S'$, where f is π_α-coCartesian and $\pi_\alpha(g)$ is an equivalence. Then the image of g in S' belongs to $M_{S'}$ if and only if the image of h in S' belongs to $M_{S'}$. In particular, the image in S' of any π_α-coCartesian morphism of $K_\alpha^\triangleleft$ belongs to $M_{S'}$.

(*ix*) Let $\alpha \in A$, and suppose we are given a map $\overline{p}_\alpha : K_\alpha^\triangleleft \to S'$ lifting p_α, such that the corresponding section of π_α is π_α-coCartesian. Then $\overline{p}_\alpha \simeq p'_\beta$ for some $\beta \in A'$.

Let $\pi^* : (\mathcal{S}et_\Delta^+)_{/\mathfrak{P}} \to (\mathcal{S}et_\Delta^+)_{/\mathfrak{P}'}$ denote the functor $\overline{X} \mapsto \overline{X} \times_{(S,M_S)} (S', M_{S'})$. Then π^* is a left Quillen functor (with respect to the model structures described in Theorem B.0.20).

Using Propositions B.4.1 and B.2.9 in combination, we can obtain even more functoriality:

Theorem B.4.2. Suppose we are given categorical patterns $\mathfrak{P} = (M_\mathcal{C}, T, \{p_\alpha : K_\alpha^\triangleleft \to \mathcal{C}\}_{\alpha \in A})$ and $\mathfrak{P}' = (M_{\mathcal{C}'}, T', \{p'_\alpha : K_\alpha'^\triangleleft \to \mathcal{C}'\}_{\alpha \in A'})$ on ∞-categories $\mathcal{C}$ and $\mathcal{C}'$. Suppose we are given a diagram of marked simplicial sets

$$(\mathcal{C}, M_\mathcal{C}) \xleftarrow{\pi} (\mathcal{K}, M) \xrightarrow{\pi'} (\mathcal{C}', M_{\mathcal{C}'}).$$

Then the construction $\overline{X} \mapsto \overline{X} \times_{(\mathcal{C},M_\mathcal{C})} (\mathcal{K}, M)$ determines a left Quillen functor from $(\mathcal{S}et_\Delta^+)_{/\mathfrak{P}}$ to $(\mathcal{S}et_\Delta^+)_{/\mathfrak{P}'}$ provided that the following conditions are satisfied:

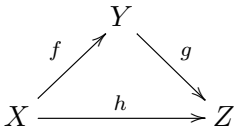
(1) The map $\pi : \mathcal{K} \to \mathcal{C}$ is a flat categorical fibration.

(2) The collections of morphisms $M_\mathcal{C}$ and M contain all equivalences in $\mathcal{C}$ and $\mathcal{K}$, respectively, and are closed under composition.

(3) For every 2-simplex σ of $\mathcal{K}$ such that $\pi(\sigma) \in T$, we have $\pi'(\sigma) \in T'$. Moreover, T contains all 2-simplices $\Delta^2 \to \mathcal{C}$ whose restriction to $\Delta^{\{0,1\}}$ is an equivalence in $\mathcal{C}$.

(4) For every edge $\Delta^1 \to \mathcal{C}$ belonging to $M_\mathcal{C}$, the induced map $\mathcal{K} \times_\mathcal{C} \Delta^1 \to \Delta^1$ is a Cartesian fibration.

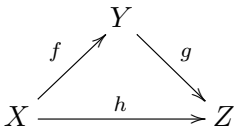
(5) Each of the simplicial sets K_α is an ∞-category, and each of the induced maps $\pi_\alpha : K_\alpha^\triangleleft \times_\mathcal{C} \mathcal{K} \to K_\alpha^\triangleleft$ is a coCartesian fibration.



(6) For $\alpha \in A$ and every coCartesian section s of π_α, the composite map

$$K_\alpha^\triangleleft \to K_\alpha^\triangleleft \times_\mathcal{C} \mathcal{K} \to \mathcal{K} \xrightarrow{\pi'} \mathcal{C}'$$

can be identified with p'_β, for some $\beta \in A'$.



小红书
小红书号:3189205503 qq

(7) Suppose we are given a commutative diagram

in $\mathcal{K}$, where g is locally π-Cartesian, $\pi(g) \in M_{\mathcal{C}}$, and $\pi(f)$ is an equivalence. Then $f \in M$ if and only if $h \in M$. In particular, a locally π-Cartesian morphism g of $\mathcal{K}$ belongs to M if and only if $\pi(g) \in M_{\mathcal{C}}$.

(8) Suppose we are given $\alpha \in A$ and a commutative diagram

in $K_{\alpha}^{\triangleleft} \times_{\mathcal{C}} \mathcal{K}$, where f is π_{α}-coCartesian and $\pi_{\alpha}(g)$ is an equivalence. Then the image of g in $\mathcal{K}$ belongs to M if and only if the image of h in $\mathcal{K}$ belongs to M.

Remark B.4.3. In the situation of Theorem B.4.2, suppose that $M_{\mathcal{C}}$ is the collection of all equivalences in $\mathcal{C}$, that A is empty, and that T and T' are the collections of all simplices in $\mathcal{C}$ and $\mathcal{C}'$, respectively. Then conditions (3), (5), (6), and (8) are automatic; condition (4) follows from (1), and condition (7) follows from (2) (if g is locally π-Cartesian and $\pi(g) \in M_{\mathcal{C}}$, then g is an equivalence so that f and h are equivalent). It therefore suffices to verify conditions (1) and (2).

Proof of Theorem B.4.2. Consider the categorical pattern $\mathfrak{P}'' = (M, \pi^{-1}(T), \{p''_{\alpha,s} : K_{\alpha}^{\triangleleft} \to \mathcal{K}\}_{(\alpha,s) \in A''})$ on $\mathcal{K}$, where A'' consists of all pairs (α, s) such $\alpha \in A$ and s is a coCartesian section of π_{α}, and $p''_{\alpha,s}$ is the composition

$$K_{\alpha}^{\triangleleft} \xrightarrow{s} \mathcal{K} \times_{\mathcal{C}} K_{\alpha}^{\triangleleft} \to \mathcal{K}.$$

The functor in question admits a factorization

$$(\mathcal{S}et_{\Delta}^{+})_{/\mathfrak{P}} \xrightarrow{\pi^*} (\mathcal{S}et_{\Delta}^{+})_{/\mathfrak{P}''} \xrightarrow{\pi'_!} (\mathcal{S}et_{\Delta}^{+})_{/\mathfrak{P}},$$

where π^* and $\pi'_!$ are left Quillen functors by virtue of Propositions B.4.1 and B.2.9. □

The proof of Proposition B.4.1 will require a long digression.

Notation B.4.4. Suppose we are given maps of simplicial sets $X \xrightarrow{\phi} Y \xrightarrow{\pi} Z$. We let $\pi_*(X)$ denote a simplicial set equipped with a map $\pi_* X \to Z$ with the following universal property: for every map of simplicial sets $K \to Z$, we have a canonical bijection

$$\mathrm{Hom}_Z(K, \pi_*(X)) \simeq \mathrm{Hom}_Y(K \times_Z Y, X).$$

小红书
小红书号:3189205503 qq

In the situation of Notation B.4.4, suppose that π is a Cartesian fibration and the map ϕ is a coCartesian fibration. Corollary HTT.3.2.2.12 implies that the map $\pi_* X \to Z$ is a coCartesian fibration. We will need some refinements of this result.

Proposition B.4.5. Let $\pi : Y \to Z$ be a flat categorical fibration of simplicial sets. Then the functor $\pi_* : (\mathcal{S}\mathrm{et}_\Delta)_{/Y} \to (\mathcal{S}\mathrm{et}_\Delta)_{/Z}$ is a right Quillen functor (with respect to the Joyal model structures). In particular, if $X \to Y$ is a categorical fibration, then the induced map $\pi_* X \to Z$ is a categorical fibration.

Proof. The functor π_* admits a left adjoint π^*, given by the formula $\pi^* A = A \times_Z Y$. To prove that π_* is a right Quillen functor, it suffices to show that π^* preserves cofibrations and weak equivalences. The case of cofibrations is clear, and the case of weak equivalences follows from Corollary B.3.15. $\square$

Example B.4.6. Suppose we are given a diagram of simplicial sets $X \overset{\phi}{\to} Y \overset{\pi}{\to} Z$. We observe that there is a canonical map $\theta : X \to \pi_* X$. If the map π is a trivial Kan fibration, then θ is a categorical equivalence. To prove this, we first choose a section $s : Z \to Y$ of π. Composition with s yields a map $r : \pi_* X \to X$ such that $r \circ \theta = \mathrm{id}_X$. Moreover, since $s \circ \pi$ is homotopic (over Z) to the map id_Y. It follows that there exists a contractible Kan complex K containing a pair of distinct points x and y and a map $h : K \times Y \to Y$ compatible with the projection map π such that $h|(\{x\} \times Y) = \mathrm{id}_Y$ and $h|(\{y\} \times Y) = s \circ \pi$. The map h induces a map $h' : K \times \pi_* X \to \pi_* X$ such that $h|(\{x\} \times \pi_* X) = \mathrm{id}_{\pi_* X}$ and $h|(\{y\} \times \pi_* X) = \theta \circ r$. It follows that r is a right homotopy inverse to θ (as well as being a strict left inverse) with respect to the Joyal model structure, so that θ is a categorical equivalence as desired.

Remark B.4.7. Suppose we are given a diagram of simplicial sets $X \overset{\phi}{\to} Y \overset{\pi}{\to} Z$, where ϕ is a categorical fibration and π is a flat categorical fibration. Let $\psi : Y' \to Y$ be a trivial Kan fibration, let $\pi' = \pi \circ \psi$, and let $X' = X \times_Y Y'$. Then the canonical map $f : \pi_* X \to \pi'_* X'$ is a categorical equivalence. To prove this, we observe that $\pi'_* X' \simeq \pi_* \psi_* X'$, and f is induced by applying π_* to a map $g : X \to \psi_* X'$. Example B.4.6 shows that g is a categorical equivalence. Since π_* is a right Quillen functor (Proposition B.4.5), it preserves categorical equivalences between fibrant objects of $(\mathcal{S}\mathrm{et}_\Delta)_{/Y}$, so f is a categorical equivalence.

Lemma B.4.8. Let $q : \mathcal{C} \to \Delta^n$ and $p : \mathcal{D} \to \mathcal{E}$ be categorical fibrations of ∞-categories, where $n \geq 2$. Let $\mathcal{C}^0$ be a full subcategory of $\mathcal{C}$ with the following properties:

(*i*) The subcategory $\mathcal{C}^0 \times_{\Delta^n} \Delta^{\{n-1,n\}}$ is a *cosieve* on $\mathcal{C}$: that is, for every morphism $f : x \to y$ in $\mathcal{C} \times_{\Delta^n} \Delta^{\{n-1,n\}}$, if $x \in \mathcal{C}^0$, then $y \in \mathcal{C}^0$.

(*ii*) For every object $y \in \mathcal{C}^0 \times_{\Delta^n} \{n-1\}$ and each $i < n-1$, there exists an object $x \in \mathcal{C}^0 \times_{\Delta^n} \{i\}$ and a q-Cartesian morphism $x \to y$ in $\mathcal{C}$.

小红书 小红书号:3189205503 qq

Suppose we are given a lifting problem

$$\begin{array}{ccc} (\mathcal{C} \times_{\Delta^n} \Lambda^n_n) \coprod_{\mathcal{C}^0 \times_{\Delta^n} \Lambda^n_n} \mathcal{C}^0 & \xrightarrow{f_0} & \mathcal{D} \\ \downarrow & \overset{f}{\nearrow} & \downarrow{\scriptstyle p} \\ \mathcal{C} & \xrightarrow{g} & \mathcal{E}\,. \end{array}$$

Let $X = (\mathcal{C} \times_{\Delta^n} \{n\}) \coprod_{\mathcal{C}^0 \times_{\Delta^n} \{n\}} (\mathcal{C}^0 \times_{\Delta^n} \Delta^{\{n-1,n\}})$; condition (i) guarantees that X can be identified with a full subcategory of $\mathcal{C}$. Assume further that

(iii) The functor $f_0 | (\mathcal{C} \times_{\Delta^n} \Delta^{\{n-1,n\}})$ is a p-right Kan extension of $f_0 | X$.

Then there exists a dotted arrow f rendering the diagram commutative.

Proof. Let $\mathcal{C}^1$ denote the simplicial subset of $\mathcal{C}$ consisting of all those simplices σ satisfying one of the following conditions:

- The image of σ in Δ^n does not contain $\Delta^{\{0,1,\ldots,n-1\}}$.
- The intersection of σ with $\mathcal{C} \times_{\Delta^n} \{n-1\}$ is contained in $\mathcal{C}^0$.

We first extend f_0 to a map $f_1 : \mathcal{C}^1 \to \mathcal{D}$. Let A be the collection of simplices $\sigma : \Delta^m \to X$. For each $\sigma \in A$, let $d(\sigma)$ denote the dimension of the simplex σ. Choose a well-ordering of A such that if $d(\sigma) < d(\tau)$, then $\sigma < \tau$. For every nondegenerate simplex $\sigma : \Delta^m \to \mathcal{C}^1$, we let $r(\sigma)$ denote the induced map $\Delta^m \times_{\Delta^n} \Delta^{\{n-1,n\}} \to X$. Let α be the order type of A, so that we have an order-preserving bijection $\beta \mapsto \sigma_\beta$ where β ranges over the set of ordinals $\{\beta : \beta < \alpha\}$. For each $\beta \leq \alpha$, we let $\mathcal{C}^1_\beta$ denote the simplicial subset of $\mathcal{C}^1$ given by the union of $\mathcal{C}^0$, $\mathcal{C} \times_{\Delta^n} \Lambda^n_n$, and those simplices σ such that $r(\sigma) = \sigma_\gamma$ for some $\gamma < \beta$. Then f_0 can be identified with a map $F_0 : \mathcal{C}^1_0 \to \mathcal{D}$. We will show that F_0 can be extended to a compatible family of maps

$$F_\beta : \mathcal{C}^1_\beta \to \mathcal{D}$$

such that $p \circ F_\beta = g | \mathcal{C}^1_\beta$. Taking $\beta = \alpha$, we will obtain the desired extension $f_1 : \mathcal{C}^1 \to \mathcal{D}$ of f_0.

The construction of F_β proceeds by induction on β. If β is a nonzero limit ordinal, we set $F_\beta = \bigcup_{\gamma < \beta} F_\gamma$. To handle successor stages, let us assume that F_β has already been defined for some $\beta < \alpha$, and let $\sigma = \sigma_\beta : \Delta^m \to X$ be the corresponding simplex. There are two cases to consider. Assume first that σ is nondegenerate. Let $\mathcal{A} = \mathcal{C}_{/\sigma} \times_{\Delta^n} \Delta^{\{0,\ldots,n-2\}}$. For every simplicial subset $K \subseteq \Delta^{\{0,\ldots,n-2\}}$, we let $\mathcal{A}_K$ denote the simplicial subset of $\mathcal{A}$ given by the union of $\mathcal{A} \times_{\mathcal{C}} \mathcal{C}^0$ and $\mathcal{A} \times_{\Delta^{\{0,\ldots,n-2\}}} K$, Let $\mathcal{A}_\partial$ denote $\mathcal{A}_{\partial \Delta^{\{0,\ldots,n-2\}}}$. We have a diagram

$$\begin{array}{ccc} (\mathcal{A}_\partial \star \Delta^m) \coprod_{\mathcal{A}_\partial \star \partial \Delta^m} (\mathcal{A} \star \partial \Delta^m) & \longrightarrow & \mathcal{C}^1_\beta \\ \downarrow & & \downarrow \\ \mathcal{A} \star \Delta^m & \longrightarrow & \mathcal{C}^1_{\beta+1}\,. \end{array}$$

小红书
小红书号:3189205503 qq

Since σ is nondegenerate, this diagram is a pushout square. The existence of $F_{\beta+1}$ is therefore equivalent to the solubility of the lifting problem

$$\begin{array}{ccc} (\mathcal{A}_{\partial} \star \Delta^m) \coprod_{\mathcal{A}_{\partial} \star \partial \Delta^m} (\mathcal{A} \star \partial \Delta^m) & \twoheadrightarrow & \mathcal{D} \\ \downarrow{\scriptstyle i} & \nearrow & \downarrow{\scriptstyle p} \\ \mathcal{A} \star \Delta^m & \longrightarrow & \mathcal{E}\,. \end{array}$$

Since p is a categorical fibration, it will suffice to show that the map i is inner anodyne. By virtue of Lemma HTT.2.1.2.3, it will suffice to show that the inclusion $i' : \mathcal{A}_{\partial} \to \mathcal{A}$ is right anodyne. In fact, we prove the following more general claim:

(∗) For every simplex $\tau \subseteq \Delta^{\{0,\ldots,n-2\}}$ and every simplicial subset $K \subseteq \tau$, the inclusion $\mathcal{A}_K \subseteq \mathcal{A}_\tau$ is right anodyne.

The proof proceeds by induction on the dimension of τ, and on the number of nondegenerate simplices of K. If $K = \tau$ there is nothing to prove. If $K \neq \tau$ is nonempty, then we can write K as a pushout $K' \coprod_{\partial \tau'} \tau'$, where τ' is a simplex of small dimension than τ. The inductive hypothesis shows that the inclusion $\mathcal{A}_{K'} \subseteq \mathcal{A}_\tau$ is right anodyne. By virtue of Proposition HTT.4.1.1.3, it will suffice to show that the inclusion $\mathcal{A}_{K'} \subseteq \mathcal{A}_K$ is right anodyne. For this, we consider the pushout diagram

$$\begin{array}{ccc} \mathcal{A}_{\partial \tau'} & \longrightarrow & \mathcal{A}_{\tau'} \\ \downarrow & & \downarrow \\ \mathcal{A}_{K'} & \longrightarrow & \mathcal{A}_K\,. \end{array}$$

Since the upper horizontal map is right anodyne by the inductive hypothesis, the lower horizontal map is right anodyne as well.

It remains to consider the case $K = \emptyset$. In this case, the inclusion $\mathcal{A}_K \subseteq \mathcal{A}_\tau$ is a pushout of the inclusion

$$i'' : \mathcal{C}^0 \times_{\mathcal{C}} \mathcal{C}_{/\sigma} \times_{\Delta^n} \tau \subseteq \mathcal{C}_{/\sigma} \times_{\Delta^n} \tau.$$

It will therefore suffice to show that i'' is right anodyne, which is equivalent (Proposition HTT.4.1.1.3) to the assertion that i'' is left cofinal. Using Proposition HTT.4.1.1.3 again, we see that it suffices to produce an object $x \in \mathcal{C}^0 \times_{\mathcal{C}} \mathcal{C}_{/\sigma} \times_{\Delta^n} \tau$ such that the corresponding maps

$$\mathcal{C}^0 \times_{\mathcal{C}} \mathcal{C}_{/\sigma} \times_{\Delta^n} \tau \hookleftarrow \Delta^0 \hookrightarrow \mathcal{C}_{/\sigma} \times_{\Delta^n} \tau$$

are both left cofinal. In other words, it suffices to guarantee that the object x is final in $\mathcal{C}_{/\sigma} \times_{\Delta^n} \tau$. The existence of such an object follows from assumption (ii) (applied to the object $y \in \mathcal{C} \times_{\Delta^n} \{n-1\}$ given by the initial vertex of σ). This completes the construction of $F_{\beta+1}$ in the case where $\sigma = \sigma_\beta$ is nondegenerate.

小红书
小红书号:3189205503 qq

Now suppose that $\sigma = \sigma_\beta : \Delta^m \to X$ is a degenerate simplex. We wish to show that the lifting problem

$$\begin{array}{ccc} \mathcal{C}^1_\beta & \xrightarrow{F_\beta} & \mathcal{D} \\ \downarrow{\scriptstyle j} & \nearrow & \downarrow{\scriptstyle p} \\ \mathcal{C}^1_{\beta+1} & \longrightarrow & \mathcal{E} \end{array}$$

admits a solution. Since p is a categorical fibration, it will suffice to show that j is a categorical equivalence. Let $\mathcal{A}$ and $\mathcal{A}_\partial$ be defined as above. Let $\mathcal{A}^1$ denote the simplicial subset of $\mathcal{A}$ spanned by those simplices $\tau : \Delta^k \to \mathcal{A}$ such that the induced map $\Delta^k \star \Delta^m \to \mathcal{C}$ factors through $\Delta^k \star \Delta^{m'}$ for some surjective map $\Delta^m \to \Delta^{m'}$ with $m' < m$. Let $\mathcal{A}^1_\partial = \mathcal{A}^1 \cap \mathcal{A}_\partial$, and let $\mathcal{A}' = \mathcal{A}^1 \coprod_{\mathcal{A}^1_\partial} \mathcal{A}_\partial$. Unwinding the definitions, we have a pushout diagram of simplicial sets

$$\begin{array}{ccc} (\mathcal{A} \star \partial\, \Delta^m) \coprod_{\mathcal{A}' \star \partial\, \Delta^m} (\mathcal{A}' \star \Delta^m) & \longrightarrow & \mathcal{C}^1_\beta \\ \downarrow{\scriptstyle j'} & & \downarrow{\scriptstyle j} \\ \mathcal{A} \star \Delta^m & \longrightarrow & \mathcal{C}_{\beta+1}\,. \end{array}$$

It will therefore suffice to show that j' is a categorical equivalence: that is, that the diagram

$$\begin{array}{ccc} \mathcal{A}' \star \partial\, \Delta^m & \longrightarrow & \mathcal{A} \star \Delta^m \\ \downarrow & & \downarrow \\ \mathcal{A}' \star \partial\, \Delta^m & \longrightarrow & \mathcal{A} \star \Delta^m \end{array}$$

is a homotopy pushout square (with respect to the Joyal model structure). In fact, we show that the vertical maps in this diagram are categorical equivalences. For this, it suffices to show that the inclusion $\mathcal{A}' \hookrightarrow \mathcal{A}$ is a categorical equivalence: that is, that the diagram

$$\begin{array}{ccc} \mathcal{A}^1_\partial & \longrightarrow & \mathcal{A}_\partial \\ \downarrow & & \downarrow \\ \mathcal{A}^1 & \longrightarrow & \mathcal{A} \end{array}$$

is a homotopy pushout square. We will prove that the horizontal maps are categorical equivalences.

Set $\mathcal{A}^0 = \mathcal{A} \times_{\mathcal{C}} \mathcal{C}^0$. For every simplicial subset $K \subseteq \Delta^{\{0,\ldots,n-2\}}$, let $\mathcal{B}_K = \mathcal{A} \times_{\Delta^n} K$ and $\mathcal{A}^0_K = \mathcal{A}^0 \times_{\Delta^n} K$, so we have an isomorphism $\mathcal{A}_K \simeq \mathcal{A}^0 \coprod_{\mathcal{A}^0_K} \mathcal{B}_K$. Let

$$\mathcal{A}^{01} = \mathcal{A}^0 \cap \mathcal{A}^1 \qquad \mathcal{A}^{01}_K = \mathcal{A}^0_K \cap \mathcal{A}^1 \qquad \mathcal{B}^1_K = \mathcal{B}_K \cap \mathcal{A}^1\,.$$

Consider the map $u_K : \mathcal{A}^{01} \coprod_{\mathcal{A}^{01}_K} \mathcal{B}^1_K \to \mathcal{A}^0 \coprod_{\mathcal{A}^0_K} \mathcal{B}_K$. We wish to prove that this map is an equivalence when $K = \Delta^{\{0,\ldots,n-2\}}$ or $K = \partial\, \Delta^{\{0,\ldots,n-2\}}$. For this, it will suffice to prove the following trio of assertions, for every $K \subseteq \Delta^{\{0,\ldots,n-2\}}$.

小红书
小红书号:3189205503 qq

(*a*) The inclusion $\mathcal{A}^{01} \hookrightarrow \mathcal{A}^0$ is a categorical equivalence.

(*b*) The inclusion $\mathcal{A}^{01}_K \hookrightarrow \mathcal{A}^0_K$ is a categorical equivalence.

(*c*) The inclusion $\mathcal{B}^1_K \hookrightarrow \mathcal{B}_K$ is a categorical equivalence.

Note that (*a*) is a special case of (*b*) (namely, the special case where $K = \Delta^{\{0,\ldots,n-2\}}$). We will prove (*c*); assertion (*b*) will follow from the same argument, replacing $\mathcal{C}$ by the full subcategory spanned by X and $\mathcal{C}^0$. Note that the constructions $K \mapsto \mathcal{B}_K$ and $K \mapsto \mathcal{B}^1_K$ commute with homotopy pushouts; we may therefore reduce to the case where K is the image of a simplex $\Delta^k \to \Delta^{\{0,\ldots,n-2\}}$. Replacing $\mathcal{C}$ by the pullback $\mathcal{C} \times_{\Delta^n} (\Delta^k \star \Delta^{\{n-1,n\}})$, we may reduce to the case $K = \Delta^{\{0,\ldots,n-2\}}$. That is, we are reduced to proving that the inclusion $\mathcal{A}^1 \hookrightarrow \mathcal{A}$ is a categorical equivalence.

Let $\mathcal{J}$ be the category whose objects are commutative diagrams

$$\begin{array}{ccc} \Delta^m & \xrightarrow{\epsilon} & \Delta^{m'} \\ & {\scriptstyle\sigma}\searrow \quad \swarrow{\scriptstyle\tau} & \\ & \mathcal{C} & \end{array}$$

where ϵ is surjective and $m' < m$; we will abuse notation by identifying the objects of $\mathcal{J}$ with simplices $\tau : \Delta^{m'} \to \mathcal{C}$. Unwinding the definitions, we see that $\mathcal{A}^0$ can be identified with the colimit of the cofibrant diagram $\theta : \mathcal{J}^{op} \to \mathcal{S}\mathrm{et}_\Delta$ given by $\tau \mapsto \Delta^{\{0,1,\ldots,n-2\}} \times_{\Delta^n} \mathcal{C}_{/\tau}$. It will therefore suffice to show that $\mathcal{A}$ is a homotopy colimit of the diagram θ. Our assumption that σ is degenerate implies that $\mathcal{J}$ has a final object (given by the factorization of σ as $\Delta^m \xrightarrow{\epsilon} \Delta^{m'} \xrightarrow{\tau} \mathcal{C}$ where τ is nondegenerate), it will suffice to show that the diagram θ is weakly equivalent to the constant diagram with value $\mathcal{A}$. In other words, we must show that for each $\tau \in \mathcal{J}$, the canonical map $\theta(\tau) \to \mathcal{A}$ is a categorical equivalence. This follows from the two-out-of-three property, since both of the vertical maps in the diagram

$$\begin{array}{ccc} \Delta^{\{0,\ldots,n-2\}} \times_{\Delta^n} \mathcal{C}_{/\tau} & \longrightarrow & \Delta^{\{0,\ldots,n-2\}} \times_{\Delta^n} \mathcal{C}_{/\sigma} \\ & \searrow \quad \swarrow & \\ & \Delta^{\{0,\ldots,n-2\}} \times_{\Delta^n} \mathcal{C}^0_{/C} & \end{array}$$

are trivial Kan fibrations, where $C = \tau(0) = \sigma(0) \in \mathcal{C}$. This completes the construction of $F_{\beta+1}$ in the case where σ is degenerate, and the construction of the map $f_1 : \mathcal{C}^1 \to \mathcal{D}$ extending f_0.

We now show that f_1 can be extended to the desired map $f : \mathcal{C} \to \mathcal{D}$. Let Y denote the full subcategory of $\mathcal{C}$ spanned by those vertices which do not belong to X. Let A' be the collection of all simplices $\sigma' : \Delta^m \to Y$ which are not contained in the intersection $Y \cap (\mathcal{C} \times_{\Delta^n} \partial\, \Delta^{\{0,\ldots,n-1\}})$. For each $\sigma' \in A'$, let $d(\sigma')$ denote the dimension of the simplex σ'. Choose a well-ordering of A' such that if $d(\sigma') < d(\tau')$, then $\sigma' < \tau'$. For every nondegenerate simplex $\sigma' : \Delta^m \to \mathcal{C}$ which does not

小红书 小红书号:3189205503 qq

belong to $\mathcal{C}^1$, we let $r'(\sigma') \in A'$ denote the simplex of Y given by $\Delta^m \times_{\Delta^n} Y \to X$. Let α' be the order type of A', so that we have an order-preserving bijection $\beta \mapsto \sigma'_\beta$ where β ranges over the set of ordinals $\{\beta : \beta < \alpha'\}$. For each $\beta \leq \alpha'$, we let $\mathcal{C}_\beta$ denote the simplicial subset of $\mathcal{C}$ given by the union of $\mathcal{C}^1$ with those simplices σ' such that $r'(\sigma') = \sigma'_\gamma$ for some $\gamma < \beta$. Then f_1 defined a map $F'_0 : \mathcal{C}_0 \to \mathcal{D}$. We will show that F'_0 can be extended to a compatible family of maps $F'_\beta : \mathcal{C}_\beta \to \mathcal{D}$ satisfying $p \circ F'_\beta = g | \mathcal{C}_\beta$. Taking $\beta = \alpha'$, we will obtain the desired extension $f : \mathcal{C} \to \mathcal{D}$ of f_0.

The construction of the maps F'_β proceeds by induction on β. If β is a nonzero limit ordinal, we set $F'_\beta = \bigcup_{\gamma<\beta} F'_\gamma$. To handle successor stages, let us assume that F'_β has already been defined for some $\beta < \alpha'$, and let $\sigma' = \sigma'_\beta : \Delta^m \to Y$ be the corresponding simplex. We first treat the case where σ' is nondegenerate. Let $X_{\sigma'/}$ denote the fiber product $X \times_{\mathcal{C}} \mathcal{C}_{\sigma'/}$. Since σ' is nondegenerate, we have a pushout diagram

$$\begin{array}{ccc} \partial \Delta^m \star X_{\sigma'/} & \longrightarrow & \mathcal{C}_\beta \\ \downarrow & & \downarrow \\ \Delta^m \star X_{\sigma'/} & \longrightarrow & \mathcal{C}_{\beta+1}\,. \end{array}$$

To construct $F'_{\beta+1}$, it suffices to solve the lifting problem depicted in the diagram

$$\begin{array}{ccc} \partial \Delta^m \star X_{\sigma'/} & \xrightarrow{h} & \mathcal{D} \\ \downarrow & & \downarrow{\scriptstyle p} \\ \Delta^m \star X_{\sigma'/} & \longrightarrow & \mathcal{E}\,. \end{array}$$

Let v denote the final vertex of σ'. It will suffice to show that h induces a p-limit diagram $h' : \{v\} \star X_{\sigma'/} \to \mathcal{D}$. Since the projection map $X_{\sigma'/} \to X \times_{\mathcal{C}} \mathcal{C}_{v/}$ is a trivial Kan fibration, it suffices to show that h exhibits $h(v)$ as a p-limit of the diagram $X \times_{\mathcal{C}} \mathcal{C}_{v/} \to \mathcal{D}$, which follows from assumption (iii).

We now treat the case where $\sigma' = \sigma'_\beta$ is a degenerate simplex of Y. Let $X'_{\sigma'/}$ denote the simplicial subset of $X_{\sigma'/}$ spanned by those simplices $\tau : \Delta^k \to X_{\sigma'/}$ such that the induced map $\Delta^m \star \Delta^k \to \mathcal{C}$ factors through $\Delta^{m'} \star \Delta^k$, for some surjective map $\Delta^m \to \Delta^{m'}$ with $m' < m$. We have a pushout diagram of simplicial sets

$$\begin{array}{ccc} (\partial \Delta^m \star X_{\sigma'/}) \star_{\partial \Delta^m \star X'_{\sigma'/}} (\Delta^m \star X'_{\sigma'/}) & \longrightarrow & \mathcal{C}_\beta \\ \downarrow & \nearrow & \downarrow \\ \Delta^m \star X_{\sigma'/} & \longrightarrow & \mathcal{C}_{\beta+1}\,. \end{array}$$

小红书
小红书号:3189205503 qq

Consequently, to prove the existence of $F_{\beta+1}$, it suffices to solve a lifting problem of the form

$$\begin{array}{ccc} (\partial\,\Delta^m \star X_{\sigma'/}) \star_{\partial\,\Delta^m \star X'_{\sigma'/}} (\Delta^m \star X'_{\sigma'/}) & \longrightarrow & \mathcal{D} \\ \downarrow{\scriptstyle j'} & \nearrow & \downarrow{\scriptstyle p} \\ \Delta^m \star X_{\sigma'/} & \longrightarrow & \mathcal{E}\,. \end{array}$$

Since p is a categorical fibration, this lifting problem will admit a solution provided that j' is a categorical equivalence. We are therefore reduced to proving that the diagram

$$\begin{array}{ccc} \partial\,\Delta^m \star X'_{\sigma'/} & \longrightarrow & \partial\,\Delta^m \star X_{\sigma'/} \\ \downarrow & & \downarrow \\ \Delta^m \star X'_{\sigma'/} & \longrightarrow & \Delta^m \star X_{\sigma'/}. \end{array}$$

is a homotopy pushout square (with respect to the Joyal model structure). In fact, we claim that the horizontal maps in this diagram are categorical equivalences. To prove this, it suffices to show that the inclusion $X'_{\sigma'/} \hookrightarrow X_{\sigma'/}$ is a categorical equivalence.

Let $\mathcal{I}$ be the category whose objects are commutative diagrams

$$\begin{array}{ccc} \Delta^m & \xrightarrow{\epsilon} & \Delta^{m'} \\ & {\scriptstyle \sigma'} \searrow \quad \swarrow {\scriptstyle \tau} & \\ & \mathcal{C} & \end{array}$$

where ϵ is surjective and $m' < m$; we will abuse notation by identifying the objects of $\mathcal{I}$ with the underlying simplices $\tau : \Delta^{m'} \to \mathcal{C}$. Unwinding the definitions, we see that $X'_{\sigma'/}$ can be identified with the colimit of the cofibrant diagram $\theta' : \mathcal{I}^{op} \to \mathcal{S}\mathrm{et}_\Delta$ given by $\tau \mapsto X \times_{\mathcal{C}} \mathcal{C}_{\tau/}$. It will therefore suffice to show that $X_{\sigma'/}$ is a homotopy colimit of the diagram θ'. Our assumption that σ is degenerate implies that $\mathcal{I}$ has a final object (given by the factorization of σ as $\Delta^M \xrightarrow{\epsilon} \Delta^{m'} \xrightarrow{\tau} \mathcal{C}$ where τ is nondegenerate), it will suffice to show that the diagram θ' is weakly equivalent to the constant diagram with value $X'_{\sigma'/}$. In other words, we must show that for each $\tau \in \mathcal{I}$, the canonical map

$$X \times_{\mathcal{C}} \mathcal{C}_{\tau/} \to X_{\sigma'/}$$

is a categorical equivalence. This follows from the two-out-of-three property, since we have a commutative diagram

$$\begin{array}{ccc} X \times_{\mathcal{C}} \mathcal{C}_{\tau/} & \longrightarrow & X_{\sigma'/} \\ & \searrow \quad \swarrow & \\ & X \times_{\mathcal{C}} \mathcal{C}_{D/} & \end{array}$$

where $D = \sigma'(m) \in \mathcal{C}$, and the vertical maps are trivial Kan fibrations. □

小红书
小红书号:3189205503 qq

Proposition B.4.9. Suppose we are given a diagram of ∞-categories $X \xrightarrow{\phi} Y \xrightarrow{\pi} Z$ where ϕ is a categorical fibration and π is a flat categorical fibration. Let $Y' \subseteq Y$ be a full subcategory. Let $X' = Y' \times_Y X$, let $\pi' = \pi | Y'$, and let $\psi : \pi_* X \to \pi'_* X'$ denote the restriction map. Let K be another ∞-category, let $\overline{p} : K^{\triangleleft} \to \pi_* X$ be a diagram, and suppose that the following conditions are satisfied:

(*i*) The full subcategory $Y' \times_Z K^{\triangleleft} \subseteq Y \times_Z K^{\triangleleft}$ is a cosieve on $Y \times_Z K^{\triangleleft}$.

(*ii*) For every object $y \in Y'$ and every morphism $f : z \to \pi(y)$ in Z, there exists a π-Cartesian morphism $\overline{f} : \overline{z} \to y$ in Y' with $\pi(\overline{f}) = f$.

(*iii*) The map $\overline{F} : K^{\triangleleft} \times_Z Y \to X$ classified by $\overline{p}$ is a ϕ-right Kan extension of

$$F = \overline{F} | ((K \times_Z Y) \coprod_{K \times_Z Y'} (K^{\triangleleft} \times_Z Y')).$$

Then $\overline{p}$ is a ψ-limit diagram.

Proof. We must show that for $n \geq 2$, every lifting problem of the form

$$\begin{array}{ccc} \partial \Delta^{n-1} \star K & \xrightarrow{f_0} & \pi_* X \\ \downarrow & \nearrow & \downarrow \psi \\ \Delta^{n-1} \star K & \longrightarrow & \pi'_* X' \end{array}$$

admits a solution, provided that $f_0 | \{n-1\} \star K$ coincides with $\overline{p}$. Let $\mathcal{C} = (\Delta^{n-1} \star K) \times_Z Y$, and observe that $\mathcal{C}$ is equipped with a map $\mathcal{C} \to \Delta^n$. Let $\mathcal{C}^0 = \mathcal{C} \times_Y Y'$. Unwinding the definitions, we see that it suffices to solve a lifting problem of the form

$$\begin{array}{ccc} (\mathcal{C} \times_{\Delta^n} \Lambda^n_n) \coprod_{\mathcal{C}^0 \times_{\Delta^n} \Lambda^n_n} \mathcal{C}^0 & \longrightarrow & Y \\ \downarrow & \nearrow & \downarrow \phi \\ \mathcal{C} & \longrightarrow & Z. \end{array}$$

The desired result now follows from Lemma B.4.8 and our hypothesis on $\overline{F}$. □

We will typically apply Proposition B.4.9 in the special case where $Y' = \emptyset$, so that $\pi'_* X' \simeq Z$. In this cases, conditions (*i*) and (*ii*) are automatic.

Proposition B.4.10. Suppose we are given a diagram of categorical fibrations $X \xrightarrow{\phi} Y \xrightarrow{\pi} Z$ where π is a Cartesian fibration and ϕ is a categorical fibration. Suppose that the following condition is satisfied:

小红书
小红书号:3189205503 qq

($*$) For every vertex x of X and every π-Cartesian edge $f : \phi(x) \to y$ in Y, there exists a ϕ-coCartesian edge $\overline{f} : x \to \overline{y}$ such that $f = \phi(\overline{f})$.

Then:

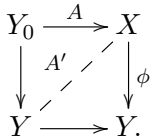
(1) The map $\psi : \pi_* X \to Z$ is a coCartesian fibration.

(2) Let $\overline{e}$ be an edge of $\pi_* X$ lying over an edge $e : z \to z'$ in Z, corresponding to a map $F : \Delta^1 \times_Z Y \to X$. Then $\overline{e}$ is ψ-coCartesian if and only if the following condition is satisfied:

   (a) For every π-Cartesian edge $\widetilde{e}$ of Y lying over e, the image $F(e)$ is a ϕ-coCartesian edge of X.

Proof. We use the same strategy as in the proof of Proposition HTT.3.2.2.12 . Proposition B.4.5 guarantees that ψ is a categorical fibration, and in particular an inner fibration. Let us say that an edge of $\pi_* X$ is *special* if it satisfies condition (a). We will prove:

(i) For every vertex $A \in \pi_* X$ and every edge $e : \psi(A) \to z$ in Z, there exists a special edge $\overline{e} : A \to \overline{z}$ in $\pi_* X$ such that $\psi(\overline{e}) = e$.



(ii) Every special edge of $\pi_* X$ is ψ-coCartesian.

This will prove (1) and the "if" direction of (2). To prove the "only if" direction, we consider an arbitrary ψ-coCartesian edge $\overline{e} : A \to B$ in $\pi_* X$ covering an edge $e : z \to z'$ in Z. Using (i), we can choose a special edge $\overline{e}' : A \to C$ in $\pi_* X$ covering e. Using the assumption that $\overline{e}$ is ψ-coCartesian, we can choose a 2-simplex

whose image in Z is degenerate. Since $\overline{e}'$ and $\overline{e}$ are both ψ-coCartesian (by (ii)), we conclude that $\overline{e}''$ is an equivalence in the ∞-category $(\pi_* X)_{z'}$. Since $\overline{e}'$ satisfies (a), we deduce that $\overline{e}$ satisfies (a), as desired.

We now prove (i). Without loss of generality, we may replace X and Y by their pullbacks along the edge $e : \Delta^1 \to Z$, and thereby reduce to the case $Z = \Delta^1$. We can identify A with a section of the projection map $X_0 \to Y_0$. To produce an edge $\overline{e} : A \to \overline{z}$ as in (i), we must solve the lifting problem depicted in the diagram

Moreover, $\overline{e}$ is special if and only if the map A' carries π-Cartesian morphisms of Y to ϕ-coCartesian morphisms in X. Using Proposition HTT.3.2.2.7 , we can choose a functor $\chi : X_1 \to X_0$ and a

小红书
小红书号:3189205503 qq

quasi-equivalence $M(\phi) \to X$. Using Propositions HTT.A.2.3.1 , we may reduce to the problem of providing a dotted arrow in the diagram

$$\begin{array}{ccc} X_0 & \longrightarrow & X \\ \downarrow & \nearrow_{\phi} & \downarrow \\ M(\phi) & \longrightarrow & Y \end{array}$$

which carries the marked edges of $M^{\natural}(\phi)$ to ϕ-coCartesian edges of X. This follows from the fact that $\phi^{X_1} : \mathrm{Fun}(X_1, X) \to \mathrm{Fun}(X_1, Y)$ is a coCartesian fibration and the description of the ϕ^{X_1}-coCartesian morphisms (Proposition HTT.3.1.2.1).

The proof of (ii) is similar. We wish to prove that every lifting problem

$$\begin{array}{ccc} \Lambda^n_0 & \longrightarrow & \pi_* X \\ \downarrow & \nearrow & \downarrow \psi \\ \Delta^n & \longrightarrow & Z \end{array}$$

has a solution provided that $n \geq 2$ and the upper horizontal map carries $\Delta^{\{0,1\}} \subseteq \Lambda^n_0$ to a special edge of $\pi_* X$. Replacing X and Y by their pullbacks along $\Delta^n \to Z$, we can assume that the lower horizontal map is an isomorphism. Unwinding the definitions, we are reduced to solving the lifting problem

$$\begin{array}{ccc} Y \times_{\Delta^n} \Lambda^n_0 & \longrightarrow & X \\ \downarrow & \nearrow & \downarrow \phi \\ Y & \longrightarrow & Y. \end{array}$$

Using Proposition HTT.3.2.2.7 , we can choose a composable sequence of morphisms

$$\chi : Y_0 \leftarrow \cdots \leftarrow Y_n$$

and a quasi-equivalence $M(\chi) \to Y$. Invoking Propositions HTT.A.2.3.1 , we may reduce to the associated mapping problem

$$\begin{array}{ccc} M(\psi) \times_{\Delta^n} \Lambda^n_0 & \longrightarrow & X \\ \downarrow & \nearrow & \downarrow \phi \\ M(\psi) & \longrightarrow & Y. \end{array}$$

This is equivalent to the mapping problem

$$\begin{array}{ccc} X_n \times \Lambda^n_i & \longrightarrow & X \\ \downarrow & & \downarrow \phi \\ X_n \times \Delta^n & \longrightarrow & Y. \end{array}$$

which admits a solution by virtue of Proposition HTT.3.1.2.1 . □

小红书
小红书号:3189205503 qq

Corollary B.4.11. Suppose we are given a diagram of categorical fibrations $X \xrightarrow{\phi} Y \xrightarrow{\pi} Z$. Let M be a collection of edges of Z containing all degenerate edges and T a collection of 2-simplices of Z containing all degenerate 2-simplices. Suppose that the following conditions are satisfied:

(a) The categorical fibration π is flat.

(b) For every vertex $y \in Y$ and every edge $f : z \to \pi(y)$ of Z which belongs to M, there exists a locally π-Cartesian edge $\overline{f} : \overline{z} \to y$ such that $\pi(\overline{f}) = f$.

(c) For every vertex x of X and every locally π-Cartesian edge $f : \phi(x) \to y$ in Y such that $\pi(f) \in M$, there exists a locally ϕ-coCartesian edge $\overline{f} : x \to \overline{y}$ such that $f = \phi(\overline{f})$.

(d) Let $\overline{f}$ be a locally ϕ-coCartesian edge of X such that $f = \phi(\overline{f})$ is locally π-Cartesian and $\pi(f) \in M$, and suppose that $f : \Delta^{\{0,1\}} \to Y$ is extended to a 2-simplex $\sigma : \Delta^2 \to Y$ such that $\pi(\sigma) \in T$. Then $\overline{f}$ determines a ϕ'-coCartesian morphism of $X \times_Y \Delta^2$, where $\phi' : X \times_Y \Delta^2 \to \Delta^2$ denotes the projection.

Then:

(1) The map $\psi : \pi_* X \to Z$ is a categorical fibration.

(2) For every vertex $x \in \pi_* X$ and edge morphism $f : \psi(x) \to z$ of Z which belongs to M, there exists a locally ψ-coCartesian edge $\overline{f} : x \to \overline{z}$ of $\pi_* X$ with $\psi(\overline{f}) = f$.

(3) Let $\overline{f}$ be an edge of $\pi_* X$ lying over an edge $\psi(\overline{f}) = f : z \to z'$ which belongs to M, corresponding to a map $F : \Delta^1 \times_Z Y \to X$. Then $\overline{f}$ is locally ψ-coCartesian if and only if the following condition is satisfied:

   ($*$) For every locally π-Cartesian edge $\widetilde{f}$ of Y lying over f, the image $F(\widetilde{f})$ is a locally ϕ-coCartesian edge of X.

(4) Let $\sigma : \Delta^2 \to Z$ be 2-simplex belonging to T such that the edge $f = \sigma | \Delta^{\{0,1\}}$ belongs to M, and let $\overline{f}$ be a locally ψ-coCartesian edge of $\pi_* X$ lying over f. Then $\overline{f}$ determines a ψ'-coCartesian edge of $\pi_* X \times_Z \Delta^2$, where ψ' denotes the projection $\pi_* \times_Z \Delta^2 \to \Delta^2$.

Proof. Assertion (1) follows from Proposition B.4.5, and assertions (2) and (3) follow by applying Proposition B.4.10 to the diagram $X \times_Z \Delta^1 \to Y \times_Z \Delta^1 \to \Delta^1$. To prove (4), we are free to replace Z by Δ^2 and thereby reduce to the case where σ is an isomorphism. Let $\overline{f}$ be a locally ψ-coCartesian edge of $\pi_* X$ lying over $\Delta^{\{0,1\}}$, which we can identify with a functor $F : Y \times_{\Delta^2} \Delta^{\{0,1\}} \to X \times_{\Delta^2} \Delta^{\{0,1\}}$. We wish to show that f is ψ-coCartesian. By virtue of (the dual of) Proposition B.4.9, it will suffice to show that the functor F is a ψ-left Kan extension of $F | Y_0$, where $Y_0 = Y \times_{\Delta^2} \{0\}$. Unwinding the definitions, we must show that for each object $y \in Y \times_{\Delta^2} \{1\}$, the map F induces a ϕ-colimit diagram

$$\theta : (Y_0 \times_Y Y_{/y})^{\triangleright} \to (Y \times_{\Delta^2} \Delta^{\{0,1\}})^{\triangleright}_{/y} \to Y \times_{\Delta^2} \Delta^{\{0,1\}} \xrightarrow{F} X.$$

小红书
小红书号:3189205503 qq

Condition (b) guarantees that the projection $Y \times_{\Delta^2} \Delta^{\{0,1\}} \to \Delta^{\{0,1\}}$ is a Cartesian fibration, so the ∞-category $Y_0 \times_Y Y_{/y}$ has a final object, given by a locally π-Cartesian morphism $f : y' \to y$. It follows that θ is a ϕ-colimit diagram if and only if $F(f)$ is a ϕ-coCartesian morphism in X. Criterion (3) guarantees that $F(f)$ is locally ψ-coCartesian, which implies that $F(f)$ is ψ-coCartesian by virtue of assumption (d). □

Proposition B.4.12. Suppose we are given a diagram of ∞-categories $X \xrightarrow{\phi} Y \xrightarrow{\pi} Z$ where π is a flat categorical fibration and ϕ is a categorical fibration. Let $\psi : \pi_* X \to Z$ denote the projection, let K be an ∞-category, let $\overline{p}_0 : K^{\triangleleft} \to Z$ be a diagram, and assume that the induced map $\pi' : K^{\triangleleft} \times_Z Y \to K^{\triangleleft}$ is a coCartesian fibration. Let v denote the cone point of $K^{\triangleleft}$, let $\mathcal{C} = \pi'^{-1}\{v\}$, and choose a map $K^{\triangleleft} \times \mathcal{C} \to K^{\triangleleft} \times_Z Y$ which is the identity on $\{v\} \times \mathcal{C}$ and carries $e \times \{C\}$ to a π'-coCartesian edge of $K^{\triangleleft} \times_Z Y$, for each edge e of $K^{\triangleleft}$ and each object C of $\mathcal{C}$. Then:

(1) Let $\overline{p} : K^{\triangleleft} \to \pi_* X$ be a map lifting $\overline{p}_0$, and suppose that for each $C \in \mathcal{C}$ the induced map

$$K^{\triangleleft} \times \{C\} \hookrightarrow K^{\triangleleft} \times \mathcal{C} \to K^{\triangleleft} \times_Z Y \to X$$

is a ϕ-limit diagram. Then $\overline{p}$ is a ψ-limit diagram.

(2) Suppose that $p : K^{\triangleleft} \to \pi_* X$ is a map lifting $p_0 = \overline{p}_0 | K$, and suppose that for each $C \in \mathcal{C}$ the induced map

$$K \times \{C\} \hookrightarrow K \times \mathcal{C} \to K \times_Z Y \to X$$

admits a ψ-limit diagram lifting the map

$$K^{\triangleleft} \times \{C\} \hookrightarrow K^{\triangleleft} \times \mathcal{C} \to K^{\triangleleft} \times_Z Y \to Y.$$

Then there exists an extension $\overline{p} : K^{\triangleleft} \to \pi_* X$ of p lifting $\overline{p}_0$ which satisfies condition (1).

Proof. Let $\overline{p} : K^{\triangleleft} \to \pi_* X$ satisfy the condition described in (1). We can identify $\overline{p}$ with a map $\overline{F} : K^{\triangleleft} \times_Z Y \to X$. In view of Proposition B.4.9, it will suffice to show that $\overline{F}$ is a ϕ-right Kan extension of $\overline{F} | K \times_Z Y$. Pick an object $C \in \mathcal{C}$; we wish to show that $\overline{F}$ is a ϕ-right Kan extension of F at C. In other words, we wish to show that the map

$$(K \times_Z Y)^{\triangleleft}_{C/} \to K^{\triangleleft} \times_Z Y \xrightarrow{\overline{F}} X$$

is a ϕ-limit diagram. Since $\overline{p}$ satisfies (1), it suffices to show that the map

$$s : K \times \{C\} \to (K \times_Z Y)_{C/}$$

is right cofinal. It follows from Proposition HTT.2.4.3.2 that the projection $q : (K^{\triangleleft} \times_Z Y)_{C/} \to K^{\triangleleft}$ is a coCartesian fibration, and that s is a coCartesian section of q. To show that s is right cofinal, it will suffice to show that s admits right adjoint (this follows from Corollary HTT.4.1.3.1). In

小红书
小红书号:3189205503 qq

fact, we will show that the identity map $\mathrm{id}_{K^{\triangleleft}} \to q \circ s$ exhibits q as a right adjoint to s. For this, we must show that for every object $a \in (K \times_Z Y)_{C/}$ and every object $b \in K$, the map

$$\mathrm{Map}_{(K \times_Z Y)_{C/}}(s(b), a) \to \mathrm{Map}_K(b, q(a))$$

is a homotopy equivalence. Let $c = \mathrm{id}_C$ denote the initial object of $(K^{\triangleleft} \times_Z Y)_{C/}$, and let η denote the unique map from the cone point $v \in K^{\triangleleft}$ to b in $K^{\triangleleft}$. Using Proposition HTT.2.4.4.3 , we obtain a homotopy pullback diagram

$$\begin{array}{ccc} \mathrm{Map}_{(K^{\triangleleft} \times_Z Y)_{C/}}(s(b), a) & \longrightarrow & \mathrm{Map}_{(K^{\triangleleft} \times_Z Y)_{C/}}(c, a) \\ \downarrow & & \downarrow \theta \\ \mathrm{Map}_{K^{\triangleleft}}(b, q(a)) & \longrightarrow & \mathrm{Map}_{K^{\triangleleft}}(v, q(a)). \end{array}$$

It therefore suffices to show that the θ is a homotopy equivalence, which is clear (both the domain and the codomain of θ are contractible). This completes the proof of (1).

We now prove (2). The diagram p gives rise to a map $F : K \times_Z Y \to X$ fitting into a commutative diagram

$$\begin{array}{ccc} K \times_Z Y & \xrightarrow{F} & X \\ \downarrow & \overset{\overline{F}}{\nearrow} & \downarrow \phi \\ K^{\triangleleft} \times_Z Y & \longrightarrow & Y. \end{array}$$

The above argument shows that a dotted arrow $\overline{F}$ as indicated will correspond to a map $\overline{p} : K^{\triangleleft} \to \pi_* X$ satisfying (1) if and only if $\overline{F}$ is a ϕ-right Kan extension of F. In view of Lemma HTT.4.3.2.13 , the existence of such an extension is equivalent to the requirement that for each $C \in \mathcal{C}$, the diagram

$$(K \times_Z Y)_{C/} \to K \times_Z Y \xrightarrow{F} X$$

can be extended to a ϕ-limit diagram lifting the map

$$(K \times_Z Y)^{\triangleleft}_{C/} \to K^{\triangleleft} \times_Z Y \to Y.$$

This follows from the hypothesis of part (2) together with the fact (established above) that s is right cofinal. □

Proof of Proposition B.4.1. The functor π^* admits a right adjoint $\overline{\pi}_*$, given by the formula $\overline{\pi}_*(X', M') = (X, M)$, where:

(*a*) The simplicial set X is the full simplicial subset of $\pi_* X'$ spanned by those vertices lying over objects $s \in S$ which classify maps $S'_s \to X'_s$ which carry edges of $M_{S'}$ (which belong to S'_s) into M'.

小红书 小红书号:3189205503 qq

(*b*) An edge e of X belongs to M if and only if its image in S belongs to M_S, and e classifies a map $S' \times_S \Delta^1 \to X'$ which carries the inverse image of $M_{S'}$ in $S' \times_S \Delta^1$ into M'.

We wish to prove that the adjoint functors $(\pi^*, \overline{\pi}_*)$ give a Quillen adjunction between $(\mathcal{S}et^+_\Delta)_{/\mathfrak{P}}$ and $(\mathcal{S}et^+_\Delta)_{/\mathfrak{P}'}$. To prove this, it will suffice to show that π^* preserves cofibrations and weak equivalences. The case of cofibrations is obvious. To prove that π^* preserves weak equivalences, consider an arbitrary $\mathfrak{P}$-equivalence $\overline{Y} \to \overline{Z}$. We wish to prove that for every $\mathfrak{P}$-fibered object $\overline{X} \in (\mathcal{S}et^+_\Delta)_{/\mathfrak{P}'}$, the induced map

$$\mathrm{Map}'^\sharp_S(\pi^*\overline{Z}, \overline{X}') \to \mathrm{Map}'^\sharp_S(\pi^*\overline{Y}, \overline{X})$$

is a homotopy equivalence. We can identify this with the canonical map

$$\mathrm{Map}^\sharp_S(\overline{Z}, \overline{\pi}_*\overline{X}') \to \mathrm{Map}^\sharp_S(\overline{Y}, \overline{\pi}_*\overline{X}').$$

It will therefore suffice to show that $\overline{\pi}_*\overline{X}'$ is $\mathfrak{P}$-fibered.

Write $\overline{X}' = (X', M')$, and let $\overline{\pi}_*\overline{X}' = (X, M)$ where (X, M) is described by (a) and (b), and let $p : X' \to S'$ denote the projection. Set $W = \pi_* X'$, so that X can be identified with a full simplicial subset of W. Let M_W denote the collection of edges $e : \Delta^1 \to W$ satisfying the following condition:

(∗) The image of e in S belongs to M_S, and the edge e classifies a map $S' \times_S \Delta^1 \to X'$ which carries π_{Δ^1}-Cartesian edges of $S' \times_S \Delta^1$ into M', where $\pi_{\Delta^1} : S' \times_S \Delta^1 \to \Delta^1$ denotes the projection.

We claim that M is the inverse image of M_W in X. To see that M is contained in this inverse image, it suffices to observe that every locally π-Cartesian edge of $\pi^{-1}M_S$ belongs to $M_{S'}$, which follows from (v). Conversely, suppose that $e : x \to x'$ is an edge of X belonging to M_W, and let e classify a map $E : S' \times_S \Delta^1 \to X'$. We wish to prove that if f is an edge of $S' \times_S \Delta^1$ whose image in S' belongs to $M_{S'}$, then $E(f) \in M'$. If the composite map $\Delta^1 \xrightarrow{f} S' \times_S \Delta^1 \to \Delta^1$ is not the identity, then the inclusion $E(f) \in M'$ follows from the assumption that the vertices x and x' belong to X. Otherwise, we can factor f as a composition $f' \circ f''$, where f'' is a morphism in $S' \times_S \{0\}$ and f' is π_{Δ^1}-Cartesian. Using (v), we see that the image of f'' in S' belongs to $M_{S'}$, so that $E(f'') \in M'$ by virtue of our assumption that $x \in X$. Condition $(*)$ guarantees that $E(f') \in M'$. Using the assumption that $\overline{X}'$ is $\mathfrak{P}'$-fibered, we deduce that $E(f) \in M'$ as desired.

We wish to prove that the pair (X, M) is $\mathfrak{P}$-fibered. For this, we will verify that the map $q : X \to S$ satisfies conditions (1), (2), (3), (4), and (6) of Definition B.0.19, together with condition $(5')$ of Remark B.0.26.

(1) We must show that the map $q : X \to S$ is an inner fibration. It follows from Proposition B.2.7 (together with conditions (iv) and (vi)) that $X' \to S'$ is a categorical fibration. Proposition B.4.5 and assumption (ii) guarantee that the map $q' : W \to S$ is a categorical fibration, and therefore an inner fibration. Since X is a full simplicial subset of W, it follows also that $X \to S$ is an inner fibration.

小红书
小红书号:3189205503 qq

(2) For each edge $\Delta^1 \to S$ belonging to M_S, the induced map $q_{\Delta^1} : X \times_S \Delta^1 \to \Delta^1$ is a coCartesian fibration. It follows from Corollary B.4.11 that the map $q'_{\Delta^1} : W \times_S \Delta^1 \to \Delta^1$ is a coCartesian fibration, and that an edge of $W \times_S \Delta^1$ is q'_{Δ^1}-coCartesian if and only if its image in W belongs to M_W. To complete the proof, it will suffice to show that if $f : x \to y$ is a q'_{Δ^1}-coCartesian morphism in $W \times_S \Delta^1$ with nondegenerate image in Δ^1 and $x \in X \times_S \{0\}$, then $y \in X \times_S \{1\}$. We can identify f with a map $F : S' \times_S \Delta^1 \to X'$. To prove that $y \in X \times_S \{1\}$, we must show that for every morphism $\alpha : t \to t'$ in $S' \times_S \{1\}$ whose image in S' belongs to $M_{S'}$, we have $F(\alpha) \in M'$. Form a commutative diagram

$$\begin{array}{ccc} s & \xrightarrow{\beta} & t \\ \downarrow{\scriptstyle \alpha'} & \overset{\gamma}{\searrow} & \downarrow{\scriptstyle \alpha} \\ s' & \xrightarrow{\beta'} & t' \end{array}$$

in $S' \times_S \Delta^1$, where $s, s' \in S' \times_S \{0\}$ and the horizontal maps are π_{Δ^1}-Cartesian. Condition (v) guarantees that the images of β and β' in S' belong to $M_{S'}$. Invoking (iv), we deduce that the image of γ in S' belongs to $M_{S'}$. Invoking (v) again, the image of α' in S belongs to $M_{S'}$. Since the image of f in Y belongs to M_W, and $x \in X \times_S \{0\}$, we conclude that F carries α', β, and β' into M'.

Let $\sigma : \Delta^2 \to X'$ be the 2-simplex

$$\begin{array}{ccccc} & & F(t) & & \\ & \overset{F(\beta)}{\nearrow} & & \overset{F(\alpha)}{\searrow} & \\ F(s) & & \xrightarrow{F(\gamma)} & & F(t'). \end{array}$$

Note that since (X', M') is $\mathfrak{P}'$-fibered and $F(\alpha'), F(\beta') \in M'$, we have $F(\gamma) \in M'$. Since the image of this 2-simplex in S is degenerate, condition (vi) guarantees that its image in S' belongs to T'. Because (X', M') is $\mathfrak{P}'$-fibered, we conclude that the induced map $p' : X' \times_{S'} \Delta^2 \to \Delta^2$ is a coCartesian fibration. To prove that $F(\alpha) \in M'$, it suffices to show that $F(\alpha)$ is locally p-coCartesian, which is equivalent to the requirement that it is p'-coCartesian when regarded as a morphism of $X' \times_{S'} \Delta^2$. This follows from Proposition HTT.2.4.1.7, since $F(\beta), F(\gamma) \in M'$ implies that $F(\beta)$ and $F(\gamma)$ determine p'-coCartesian morphisms in $X' \times_{S'} \Delta^2$.

(3) A morphism f of X belongs to M if and only if $q(f)$ belongs to M_S and f is locally q-coCartesian. This follows from the proof of (2), since both conditions are equivalent to the requirement that $f \in M_W$.

小红书

(4) Given a commutative diagram

$$\begin{array}{ccc} \Delta^{\{0,1\}} & \xrightarrow{f} & X \\ \downarrow & & \downarrow{\scriptstyle q} \\ \Delta^2 & \xrightarrow{\sigma} & S, \end{array}$$

if $f \in M$ and $\sigma \in T$, then f determines an q_{Δ^2}-coCartesian edge of $X \times_S \Delta^2$, where $q_{\Delta^2} : X \times_S \Delta^2 \to \Delta^2$ denotes the projection map. In fact, f determines a q'_{Δ^2}-coCartesian edge of $W \times_S \Delta^2$, where $q'_{\Delta^2} : W \times_S \Delta^2 \to \Delta^2$ denotes the projection: this follows from Corollary B.4.11.

(6) For every index $\alpha \in A$ and every coCartesian section s of the map $q_\alpha : X \times_S K_\alpha^\triangleleft \to K_\alpha^\triangleleft$, the map s is a q-limit diagram in X. To prove this, it will suffice to show that s is a q'-limit diagram in W. We will prove this by applying Proposition B.4.12. Let s classify a map $F : K_\alpha^\triangleleft \times_S S' \to X'$, and note that the map F carries the inverse image of $M_{S'}$ into M'. Let $\mathcal{C}$ denote the fiber of the map $\pi : S' \to S$ over the image of the cone point of $K_\alpha^\triangleleft$. Choose a map $\mathcal{C} \times K_\alpha^\triangleleft \to K_\alpha^\triangleleft \times_S S' \to X'$ as in the statement of Proposition B.4.12. We wish to show that, for each $C \in \mathcal{C}$, the induced map

$$\theta : K_\alpha^\triangleleft \times \{C\} \overset{\theta_0}{\hookrightarrow} K_\alpha^\triangleleft \times \mathcal{C} \overset{\theta_1}{\to} K_\alpha^\triangleleft \times_S S' \overset{F}{\to} X'$$

is a p-limit diagram in X'. Let $\pi_\alpha : K_\alpha^\triangleleft \times_S S' \to S'$ denote the restriction of π. Since $\theta_1 \circ \theta_0$ can be identified with a π_α-coCartesian section of π_α, condition $(viii)$ and the fact that F carries the inverse image of $M_{S'}$ into M' guarantee that θ carries every edge of $K_\alpha^\triangleleft$ into M'. Using the assumption that (X', M') is $\mathfrak{P}$-fibered and condition (ix), we conclude that θ is a p-limit diagram as desired.

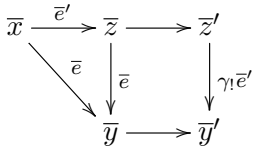
(5′) For each $\alpha \in A$ and every coCartesian section s_0 of the projection $X \times_S K_\alpha \to K_\alpha$, there exists a coCartesian section s of $X \times_S K_\alpha^\triangleleft \to K_\alpha^\triangleleft$ extending s_0. The construction of s amounts to solving a lifting problem

$$\begin{array}{ccc} S' \times_S K_\alpha & \xrightarrow{F} & X' \\ \downarrow & \overset{\overline{F}}{\nearrow} & \downarrow{\scriptstyle p} \\ S' \times_S K_\alpha^\triangleleft & \longrightarrow & S'. \end{array}$$

Since s_0 is a coCartesian section, we have $F(e) \in M'$ for every edge e of $S' \times_S K_\alpha$ whose image in S' belongs to $M_{S'}$. As in the proof of (6), we let $\mathcal{C}$ denote the fiber of the map π over the image of the cone point of $K_\alpha^\triangleleft$, and choose a map $\mathcal{C} \times K_\alpha^\triangleleft \to S' \times_S K^\triangleleft$ as in the statement of Proposition B.4.12. Using condition (ix), the assumption that (X', M') is $\mathfrak{P}'$-fibered, and Proposition B.4.12, we conclude that there exists an extension $\overline{F}$ of F such that for each $C \in \mathcal{C}$, the composite map

$$\overline{F}_C : \{C\} \times K_\alpha^\triangleleft \hookrightarrow \mathcal{C} \times K^\triangleleft \to S' \times_S K_\alpha^\triangleleft \overset{\overline{F}}{\to} X'$$

小红书
小红书号:3189205503 qq



is a p-limit diagram. Invoking again our assumption that (X', M') is $\mathfrak{P}$-fibered (and that $\overline{F}_C$ carries each edge of $\{C\} \times K_\alpha$ into M', by virtue of $(viii)$), we deduce that $\overline{F}_C$ carries each edge of $K_\alpha^\triangleleft$ into M'. The map $\overline{F}$ corresponds to a section s of the projection $X \times_S K_\alpha^\triangleleft \to K_\alpha^\triangleleft$ extending s_0. To complete the verification of $(6')$, it will suffice to show that s is a coCartesian: in other words, we must show that $\overline{F}(e) \in M'$ whenever $e : x \to y$ is an morphism of $S' \times_S K_\alpha^\triangleleft$ whose image in S' belongs to $M_{S'}$.

If $x \notin \mathcal{C}$, then e is a morphism of $S' \times_S K_\alpha$ so that $\overline{F}(e) = F(e) \in M'$ as desired. We may therefore assume that $x \in \mathcal{C}$. Suppose for the moment that $y \notin \mathcal{C}$, so that the image of y in $K_\alpha^\triangleleft$ is a vertex $y_0 \in K_\alpha$. We can factor e as a composition $e' \circ e''$, where e'' is a π_α-coCartesian morphism lying in the image of the map $\{x\} \times K_\alpha^\triangleleft \to S' \times_S K_\alpha^\triangleleft$ and e' is a morphism in the fiber $\{y_0\} \times_S S'$. Invoking assumption $(viii)$, we deduce that $e' \in M_{S'}$, so that $\overline{F}(e') = F(e') \in M'$. Since $\overline{F}(e'')$ lies in the image of $\overline{F}_x$, we conclude that $\overline{F}(e'') \in M'$. Using the fact that (X', M') is $\mathfrak{P}$-fibered, we conclude that $\overline{F}(e) \in M'$, as desired.

We now treat the case where $x, y \in \mathcal{C}$. Let ψ denote the projection map $X' \times_S K_\alpha^\triangleleft \to S' \times_S K_\alpha^\triangleleft$. Applying $\overline{F}$ to e yields a morphism $\overline{e} : \overline{x} \to \overline{y}$ of $X' \times_S K_\alpha^\triangleleft$ with $\psi(\overline{e}) = e$. Since the image in S' of e belongs to $M_{S'}$, we can factor $\overline{e}$ as a composition $\overline{e}' \circ \overline{e}''$, where $\overline{e}''$ is locally ψ-coCartesian and $\overline{e}'$ is a morphism belonging to $\psi^{-1}\{x\}$. Using assumption (vi) and Lemma B.1.7, we deduce that every locally ψ-coCartesian morphism is ψ-coCartesian provided that its image in S' belongs to $M_{S'}$; in particular, $\overline{e}''$ is ψ-coCartesian. We wish to prove that $\overline{e}$ is locally ψ-coCartesian, which is equivalent to the assertion that $\overline{e}'$ is an equivalence. Choose a π_α-coCartesian section θ of the projection π_α which carries the cone point of $K_\alpha^\triangleleft$ to y. Since (X', M') is $\mathfrak{P}$-fibered, the coCartesian fibration

$$X' \times_{S'} K_\alpha^\triangleleft \to K_\alpha^\triangleleft$$

is classified by a limit diagram $\chi : K_\alpha^\triangleleft \to \mathcal{C}\mathrm{at}_\infty$, so that $\overline{e}'$ is an equivalence if and only if $\gamma_! \overline{e}'$ is an equivalence in $\psi^{-1}\{y'\}$ for every morphism $\gamma : y \to y'$ lying in the image of θ. We have a commutative diagram in $X' \times_S K_\alpha^\triangleleft$

where the horizontal maps are ψ-coCartesian. Moreover, the argument of the preceding paragraph shows that the map $\overline{x} \to \overline{y}'$ is ψ-coCartesian. Applying Proposition HTT.2.4.1.7 , we deduce that $\gamma_! \overline{e}'$ is locally ψ-coCartesian, and therefore an equivalence because it belongs to a fiber of ψ.
